Archē

Archē*, or 'principle', is an ancient Greek philosophical term. Building on earlier uses, Aristotle established it as a technical term with a number of related meanings, including 'originating source', 'cause', 'principle of knowledge' and 'basic entity'. Accordingly, it acquired importance in metaphysics, epistemology and philosophy of science, and also in the particular sciences. According to Aristotle's doctrine of scientific principles, all sciences and all scientific knowledge are founded on principles (*archai*) of a limited number of determinate kinds.*

Archē is an ancient Greek term meaning 'rule' (in a political sense) and 'beginning'. The latter sense was developed in philosophical contexts to mean 'origin', 'starting point', and 'principle' or 'first principle'. It derives from the verb *archō*, 'to begin', 'to rule'. Both verbal meanings are found in Homer, although he does not use the noun '*archē*' to mean 'rule'. In historical and political writings *archē* means 'sovereignty', 'realm', 'political office', and, in the plural, 'authorities', 'magistrates'. The history of the noun as a philosophical term is controversial. Passages like Simplicius, *On Aristotle's Physics* 24.15 and 150.23 have led many to believe that Anaximander (§2) was the first to use *archē* in a philosophical sense, while according to others these passages simply mean that he was the first to refer to the first principle of his system (in Simplicius' vocabulary, the *archē*) as *apeiron*. Depending on the view taken, the history of *archē* as a philosophical term begins either in the sixth century BC or much later.

The latter view is probably correct. *Archē* is not used in a distinctively philosophical way in the authentic fragments of any Presocratic philosopher before Philolaus and although it carries philosophical weight in his writings (fragments 6, 8, 13) as well as in the Hippocratic medical writings, in Plato (especially *Phaedo* 101, *Phaedrus* 245 and *Republic* 510-11, 533), and possibly in early Greek mathematics, we must look to Aristotle for systematic discussion and use of the term (see Aristotle §6).

In *Metaphysics* V 1 Aristotle says the term *archē* is used in six ways, including the following: 'that from which (as an immanent part) a thing first arises, for example, the foundation of a house'; 'that from which (*not* as an immanent part) a thing first arises, and from which the movement or the change naturally first proceeds, as a child comes from the father and the mother'; 'that by whose choice that which is moved is moved and that which changes changes, for example, the magistracies in cities, and the arts'; and 'that from which a thing can first be known; for example, the hypotheses are the origins of demonstrations'. Aristotle points out that all causes (*aitia*) are *archai*, as are the nature (*physis*) of a thing, the elements, thought, choice, substance, and 'that for the sake of which'.

In accordance with some of these conceptions of *archē*, Aristotle and his Peripatetic successors refer to the basic principles of the Presocratics (whether they were conceived of as originative substances or as fundamental entities) as *archai*. In *Physics* I, Aristotle develops a more abstract account of physical *archai*, identifying them as two (matter and form) or three (matter, form and privation) (see Aristotle §8). The Stoics, who were material monists, believed in two *archai* - a passive principle, matter, and an active principle, god, which like Aristotle's physical *archai* are best understood as inseparable aspects of substance (see Stoicism §3).

It is unclear how, why or in what field the Greeks first conceived of basing proofs on unprovable principles (the fundamental step in axiomatics). By the late fifth century BC mathematics had made progress in this direction. In discussing mathematical method in the *Republic*, Plato emphasizes the way geometry establishes conclusions on the basis of unproved 'hypotheses' which are considered obvious, but which are not, strictly speaking, known. (Unfortunately, Plato does not make clear what these 'hypotheses' are.) By contrast, dialectic proceeds from hypotheses to an 'unhypothetical' *archē* which is the basis of certain knowledge.

Influenced to some extent by mathematics, Aristotle asserts in the *Posterior Analytics* that every science is based on three kinds of *archai*: definitions (*horismoi*), hypotheses, which seem to posit the existence of the basic entities which the science studies, and common principles (*koina*) or axioms (*axiōmata*) such as the Law of Non-Contradiction, used in more than one science. These kinds of principles correspond approximately, but not perfectly, to the principles on which the geometry of Euclid's *Elements* is based: definitions (*horoi*), construction postulates (*aitēmata*) and 'common notions' (*koinai ennoiai*).

The *Posterior Analytics* develops a general doctrine of scientific *archai*. Every science (*epistēmē*) consists of demonstrations of conclusions from *archai*. Aristotle argues that the *archai* cannot themselves be demonstrated. The *archai* must satisfy several strict conditions: they must be true, primary, immediate, and prior to the conclusions that follow from them. Moreover, they must be better known than and causes (that is, *aitia*: ‘grounds’, ‘explanations’) of these conclusions. ‘Primary’ and ‘immediate’ here mean ‘unprovable’ or ‘basic’. By ‘better known’ and ‘prior’ Aristotle means better known and prior ‘in nature’ to the conclusions; that is, more intelligible. By ‘causes’, Aristotle indicates that scientific *archai* are causally prior to the facts that follow from them; he is thus committed to believing in a real ordering of facts in which some are more causally basic than others, and to holding that scientific knowledge is a matter of knowing the basic facts, knowing that they are basic, and knowing how the derivative facts follow from them. It follows that scientific *archai* are basic both ontologically and epistemologically; an *archē* is an *archē* within the context of a single science. In general, an *archē* of one science has no status either as *archē* or as conclusion in another science. In one sense *archē* is a relative term: an *archē* is an *archē* of or for certain other facts or propositions (Aristotle did not always distinguish these from one another). In another sense an *archē* is absolute: a fact is basic whether or not anyone happens to recognize it as such.

Architecture, aesthetics of

The philosophy of architecture is a branch of philosophical aesthetics concerned with various issues arising from the theory and practice of building design. The oldest writings on architecture date from antiquity and link architectural principles to more general, metaphysical elements of form and order. This tradition persisted into and beyond the Renaissance, but in the eighteenth century it began to give way to new philosophies of mind and value, according to which the determining factors of aesthetic experience are the interests and attitudes of informed subjects. Thereby architecture came within the sphere of the theory of taste.

Nineteenth-century revivals of classical and Gothic styles produced renewed interest in the nature of architecture, its place within the scheme of arts and sciences, and its role in society. Following this, twentieth-century modernism offered various accounts of the rational basis of architectural form and combined these with utopian political philosophies. As it had been in antiquity and during the Renaissance, architecture was again viewed as central to and partly definitive of a culture. More recently, however, attention has returned to analytical questions such as 'What is the nature of the aesthetic experience of architecture?' and, relatedly, 'How is it possible for there to be reasoned, critical judgments about the meaning and value of buildings?'

In order to deal with such issues philosophers in different traditions have begun to develop accounts of the social aspects of architecture, recognizing that critical judgments presuppose the capacity to identify buildings as being of various types: public, domestic, formal, informal and so on. The nature of architecture is in part, therefore, a matter of social convention or more generally 'forms of life', and this limits the scope for abstract ahistorical theorizing. None the less, the resources of metaphysics, the theories of mind, action, meaning and value are all utilized in contemporary philosophy of architecture.

1 The subject and its central themes

Two works have influenced Western architectural theory throughout most of its history: Vitruvius' *De architectura libri X (Ten Books on Architecture)*; and Alberti's *De re aedificatoria (On Architecture)*. The first bears a dedication toAugustus Caesar, and the second, which derives from it, is a product of the Italian Renaissance. Ironically, although written 1,500 years apart, they were first published in printed form within a year of each other - Alberti in 1485 and Vitruvius in 1486 - and have stood side by side as foundational texts ever since.

Like most writers of treatises on architecture, Vitruvius and Alberti are largely concerned with practical questions of design and construction, but they also address aesthetic aspects of the subject. Commenting on the 'departments of architecture', Vitruvius writes

> all of these must be built with due reference to durability (*utilitas*) and beauty (*venustas*)… [and beauty will be assured] when the appearance of the work is pleasing and in good taste, and when its members are in due proportion according to correct principles of symmetry.
>
> (*De architectura libri X*, I, iii, 2)

Earlier he explains that symmetry consists in 'a proper agreement between the members of the work itself, and relation between the different parts and the whole general scheme, in accordance with a certain part selected as standard' (*De architectura libri X*, I, ii, 4).

The classical idea that architectural beauty rests upon compositional unity is taken up by Alberti and developed in a direction that raises a further philosophical issue, namely, that of the proper object of aesthetic assessment. At the outset of *De re aedificatoria* he writes

> It is the property and business of the design to appoint to the edifice and all its parts their proper places, determinate number, just proportion and beautiful order; so that the whole form of the structure be proportionable. Nor has this design anything that makes it in its nature inseparable from matter…. Which being granted, we shall call the design a firm and graceful pre-ordering of the lines and angles conceived in the mind, and contrived by an ingenious artist.
>
> (1452, I, i)

Subsequent authors have returned to these ideas of the nature and of the true bearer of architectural beauty; mostly to endorse them, but also to develop or reject them. In the seventeenth century, for example, the English theorist Sir Henry Wotton coined a much quoted formula that derives (via Palladio and Alberti) from Vitruvius, when he wrote that architecture must aim to provide 'commodity, firmness and delight'. In the following century the French architect and theoristÉtienne-Louis Boullée echoed Alberti's claim that architecture should be identified with abstract design rather than with material construction:

> What is architecture? Shall I join Vitruvius in defining it as the art of building? Indeed, no, for there is a flagrant error in this definition. Vitruvius mistakes the effect for the cause. In order to execute it is first necessary to conceive… it is this product of the mind, this process of creation, that constitutes architecture.
>
> (Boullée 1790)

Although none of these writers is a philosopher, the issues they raise are instances of central topics in aesthetic theory, namely, the basis of value and the objects of appreciation. Reflection on architecture gives rise to further questions concerning its status in respect of the fine arts, the character of our experience of designs and buildings, and the relation of the built environment to other aspects of human existence, for example, religion, morality and politics. The systematic exploration of these and similar issues constitutes the philosophy of architecture.

Conceived in these terms the subject is a modern one, for although the roots of architectural theorizing run deep into the foundations of Western culture, the writings so far cited contain, at best, incidental reflections on normative and ontological issues. It is only with the development of aesthetics as a distinct branch of academic philosophy, a process begun in the eighteenth century, that conceptual resources were fashioned for constructing comprehensive philosophical accounts of architecture. Indeed, it can even be argued that the existence of the subject dates from the publication of Roger Scruton's *The Aesthetics of Architecture* in 1979. For until then philosophical discussions were partial and generally ill-informed. What Scruton offers, by contrast, is a sustained investigation of the aesthetic experience of architecture which draws upon several parts of analytical philosophy, most prominently the philosophy of mind and action, and the theory of meaning.

One way of reading Scruton's work is as an attempt to answer the question of how there can be a critical experience of architecture. This follows the Kantian approach, according to which the general form of a philosophical question is 'How is such-and-such possible? Scruton is an avowed admirer of Kant and particularly values the account of aesthetic experience set out in *Critique of Judgment*, even though his own view departs significantly fromKant's. It is therefore unsurprising that the perspective developed in *The Aesthetics of Architecture* is broadly Kantian in nature. Before coming to this, however, and in order to ensure a proper appreciation of his work and its point of departure from a purely Kantian aesthetic, it is necessary to return to antiquity and to examine some of the central ideas that informed pre-Kantian thought.

2 Pre-Kantian traditions

In Book IX, Vitruvius discusses the wisdom of the ancients, illustrating this with accounts of the geometrical discoveries of Plato and Pythagoras. He cites the latter's famous triangle theorem and adds, 'When Pythagoras discovered this fact, he had no doubt that the Muses had guided him… and it is said that he very gratefully offered sacrifice' (1914: 253). AlthoughVitruvius is concerned with the practical applications of the theorem, mention of Pythagoras and the occult nature of his discovery expressed the common view that perceptible forms are underwritten by an abstract, numerically expressible, transcendental order.

Thus when, Vitruvius, Alberti, Palladio, Wotton and others write of the importance of proportion they are drawing upon a metaphysical theory of regularity. On this account beauty is obtained by designing compositions in which symmetry (*symmetria*) and due proportion (*eurythmia*) are realized, these being determined by relevant units or modules, and various operations ('modulations') performed upon them. The central Pythagorean idea (see Pythagoreanism §2), refashioned by Plato and subsequent Neoplatonists, is that empirical order results from the imposition or expression of abstract principles upon or through a medium, in this case matter. In some accounts the units and modes of combination are few and underlie all compositions; in others the modules differ according to the nature of the thing in question. Thus, one might hold that human anatomy expresses the same basic order as the relative positions and movements of the planets, or that each system is based upon its own units and modulations. Such differences, however, are less important than the extent and duration of the consensus that beauty attends

correct composition and that correct composition is a matter of cosmically legitimated proportion.

Although Vitruvius was not printed until the fifteenth century, many manuscript versions survive from the medieval period, and it is clear from this and other evidence that the Graeco-Roman metaphysics of architecture informed the theory and practice of design throughout antiquity and the Middle Ages. This raises the question of what philosophical difference, if any, underlay the development of European architecture from Greek to Romanesque and later to 'Gothic'.

At the philosophical level the difference was one of addition and interpretation rather than of replacement. For medieval builders, Platonism was maintained in a Christianized version that included the ideas of divinely ordained symmetry and proportion. Additionally these notions came to be associated with elements from scripture, and architecture came to be seen as an enduring medium for the symbolic representation of a transcendent reality. As before, the application of geometry to part and whole dominated the practice of design but a growing interest in natural forms and their variety led to an enrichment of architectural forms.

In *Gothic Architecture and Scholasticism* (1951), Erwin Panofsky proposed an interesting, though contestable, general parallelism between High Gothic cathedrals and High Scholastic philosophical and theological treatises (such as Aquinas' *Summa Theologiae*), arguing that each aspires to 'totality', 'articulation' and 'coherence'. As far as architecture is concerned, this involves an integration of theology, morality, nature and history in the plan, elevation and furnishings of the great cathedral churches; in consequence their interpretation and appreciation calls for more than (but not less than) an ability to discern and enjoy geometrical proportion.

Given their shared assumptions about the proper sources of architectural form it is unsurprising that people of the ancient and medieval worlds thought of its beauty as objective, and of aesthetic experience as an encounter with properties whose nature is independent of our experience of them. Aquinas' definition of beauty (*Summa Theologiae*, Ia.39.8.), involving integrity (*integritas*), proper proportion (*proportio sive consonantia*) and clarity (*claritas*) is an important post-Platonist statement of this idea, though its last condition introduces an element of relativity inasmuch as being 'clearly manifest' is a relational property requiring a possible knower.

Once introduced, this relational element was bound to give rise to a question of the degree to which the nature of the knower conditions the experience of beauty - and indeed of the extent to which the grounds of beauty are themselves relative. In the seventeenth century a famous dispute concerning just these matters took place between two French classical architects:Claude Perrault and François Blondel. Beginning with his edition of Vitruvius (published in 1673), Perrault (1674) contested the standard view that the object of aesthetic experience is harmonious unity established by true order and proportion. Instead he distinguished 'convincing' (*convaincantes*) and 'arbitrary' (*arbitraires*) types of beauty, the first being universally pleasing, the second depending on subjective factors such as convention, familiarity and contingent associations. On this basis he reasoned that proportion and its beauty are arbitrary, that is, not fixed by an independent reality but determined by intersubjective agreement. In reply, Blondel (1675) argued for the importance of architecture as a bridging art between painting and sculpture, and upheld the objectivity of the harmonious unity of proportionate orders. In this latter he was subsequently and emphatically supported by Boullée who insisted upon the certainty that proportion derives from natural symmetry: 'The basic rule and the one that governs the principles of architecture, originates in regularity' (Boullée 1790).

To some extent the debate was misconceived since, like Aquinas, Blondel acknowledged human relational elements in the analysis of beauty (as did Boullée and Perrault conceded the objectivity of certain kinds of aesthetic properties. None the less, it marked the beginning of a period in which philosophers and others turned towards nonobjectivist aesthetic theories. In his *Philosophical Inquiry into the Origin of our Ideas of the Sublime and the Beautiful* (1757), for example, Edmund Burke gives various psychological explanations of architectural features and of our approval of them, including the claim that Stonehenge is judged 'grand' because of the idea it induces of the difficulty of its creation (II, §12)

3 Post-Kantian perspectives

Like all such generalizations, the claim that philosophical aesthetics began with Kant is open to contention. It is undisputed, however, that his *Critique of Judgment* (1790), like his other major works, represents one of the points of definition of modern philosophy (see Kant, I. §12). In aesthetics, as in theoretical and moral thought, Kant's

principal innovation was to convert the relationship between subject and object, and to argue that sceptical doubts were answered by the consideration that since the structure of the human mind conditions the realm of its experience and understanding there is no general possibility that facts should elude the power of the mind to grasp them. The conditions of something being the case include its being a possible object of experience.

In the realm of aesthetics Kant's aim was to show how judgments of beauty could be subjective and yet assessable as correct or incorrect. When I say, 'This arched gateway is beautiful', I am not simply saying that I like it, but rather that my liking it arises from my judgment of its quality. For Kant an explanation of this involves the free play of the imagination engaged by something possessing form. Since form in this sense is a function of the mind's organizing tendency, and this tendency and the imagination are powers common to all rational subjects, if I regard the gateway as a formal object and view it apart from any practical or scientific interest then the experience I have and the pleasure that this involves will be similar for anyone else in an equivalent condition. In other words, aesthetic judgment admits the possibility of intersubjective validity.

From the perspective of the older metaphysical rationalism of Vitruvius, intersubjectivity is still subjectivity and thus falls short of what, on that account, a recognition of architectural beauty implies; but whether the Kantian view is incompatible with the kind of formal objectivism advanced by Aquinas and Blondel is another more subtle question. Concerning aesthetic experience in general and specifically that of architecture, even a supporter of Kant's general perspective may, however, take issue with his distinction between 'free' and 'dependent' beauty.

The experience of sensible forms such as a rainbow or a curling plume of rising smoke, attended to for their own sake and without any concern for their scientific nature or practical function, is the occasion of pure judgments of free beauty. Contrasted with these, and very much secondary to them, are applied judgments of dependent beauty. In the case of the latter, the experience and judgment is conditional upon a conception of the nature of the thing in question. Thus if in judging that a chapel is beautiful I take account of its religious function and relate its aesthetic qualities to this, judging it to be 'a beautiful chapel', then the beauty is dependent and the judgment is applied.

It is clear, however, that a theory of aesthetic experiences of architecture must accommodate the fact that buildings are functional objects. Someone whose judgments always abstracted from the fact that what they were looking at was an occupiable structure designed as such - a house, a church or an airport, for example - would rightly be held to be missing the whole point of these things. Architecture is not abstract sculpture and any theory of its nature and of our experience of it that seeks to give it this status is on the wrong track.

Scruton's appropriation of Kant takes the form of an acceptance of much of his general theoretical and practical philosophy, and the adoption of the structure of his aesthetic theory, with the major qualification that what was secondary and derivative in the *Critique of Judgment* becomes paradigmatic in *The Aesthetics of Architecture*. The experience of architecture is typically a judgment of feeling of something recognized to be a building and found to be pleasing as such. With this foundation in place, Scruton is able to build a theory that incorporates elements from idealist and other anti-empiricist sources. From Hegel and Wittgenstein, for example, he takes the idea that the conditions of individual subjectivity and hence of creative imagination include the pre-existence of a community within which relevant forms of practice are operative. The ability to design and to appreciate design, and the experience of occupying built designs, are constituents of given forms of life.

4 Postmodern prospects

While Scruton's book and subsequent articles comprise the most systematic and extensive conceptual study of the subject, the most active sources of writings now catalogued as philosophy of architecture lie within what is generally described as 'continental' philosophy, that is, those branches of speculative and political thought that derive from existential phenomenology and structuralism, and which include post- and neo-structuralism, deconstruction and postmodernism. Following the example of essays such as Heidegger's 'Building, Dwelling, Thinking' (1975), some writers have tried to construct a reflective phenomenology of the experience of place and of physical containment. Even when these are effective, however, they stand in need of some more general framework such as Scruton provides. It may therefore be useful to think of the two approaches as complementary, rather than as opposed to one another.

The question of how, if at all, buildings convey meaning is a recurrent theme of both analytical and continental writings, as is the issue of the connection between architecture and aspects of the wider culture. Writers of the left,

such as Habermas, and those of the right, principally Scruton and Watkin, both find reasons to followRuskin in relating aspects of architectural theory and practice to political ideas. A common target of much recent criticism is the utopian character of the Modern Movement as expressed in the writings and work of its leading figures, such as Gropius and Le Corbusier. To some extent the latter's theories of the nature of architecture and the basis of its aesthetic values recall the earlier, pre-modern, Neoplatonic traditions; but they also embody a notion of the architect as Messiah, bringing to a heedless world the redemptive truths of a revolutionary social message - a creed the advent of which has been determined by the logic of history. As Le Corbusier expressed it:

> A great epoch has begun. There exists a new spirit…. If we challenge the past, we shall learn that styles no longer exist for us, that a style belonging to our own period has come about; and that there has been a revolution.
>
> (1923)

Any plausibility such views might once have had was long ago undermined by the conspicuous failures of modernist architecture; but the philosophical attack upon them has been directed against their historicist and totalitarian assumptions. The collapse of Marxism-Leninism and the rise of radical relativism among thinkers of the left have produced less ambitious, more provisional and contextual ideas about the role of architecture as an element in social policy.

This last trend also contributes to one important strand of postmodernist thought. The term 'postmodernism', though since deployed very widely, had some of its earliest uses in the context of architectural criticism; and it was within this context that a distinction came to be drawn between two reactions to modernism. First there is that associated with Derrida andRorty, the defining characteristic of which has been the claim that rational legitimation is impossible. On this account, metaphysical theism and the foundationalist projects of Cartesian and Kantian rationalism have all failed and no other 'meta-narrative' is available. Appeals to reason are usually veiled exercises of power, and all that remains is the ironic affirmation of ideas and images that are without any means of validation.

The second postmodern reaction is characterized by Kenneth Frampton (1985) as 'critical regionalism'. Like its radical counterpart it rejects universal doctrines and policies, but not as part of a general attack on reason as such. Instead it favours local customs and practices and looks for vernacular solutions to contextually defined problems. This way of thinking about architecture has certain parallels with the style of moral and social philosophy advocated by Alasdair MacIntyre in a series of works beginning with *After Virtue* (1985).

Finally, thinking about the nature of the built environment cannot proceed for long without taking account of the natural one. The distinction between nature and artifice is indeed a philosophical question, but however this is defined it can hardly be denied that there are differences of kind or of degree between what has been built and the landscape within which it is set. As the continental and analytical traditions come into closer contact, and moral philosophers and aestheticians within each tradition learn about each other's concerns, it seems very likely that interest in the philosophy of architecture will grow and that it will become part of a larger philosophy of environment; at which point the metaphysics of symmetry can be expected to make a reappearance.

Archytas (early to mid 4th century BC)

Archytas of Tarentum (modern Taranto in southern Italy) was a contemporary and personal acquaintance of Plato, and the last of the famous Pythagoreans in antiquity. An ancient source (Proclus)chytas with those mathematicians 'who increased the number of theorems and progressed towards a more scientific arrangement of them' and ranks him among the predecessors of Euclid. His chief contribution in mathematics was to find a solution for the doubling of the cube. As a Pythagorean philosopher, Archytas gave mathematics universal scope: he viewed the four cardinal branches of Greek scientific knowledge - arithmetic, geometry, astronomy and music - as 'sister sciences' since they could be formulated mathematically. In both mathematics and music he emphasized the study of mean proportionals. He also conducted empirical investigations in acoustics and invented simple technical devices by which to illustrate the application of mathematical principles to mechanics. Archytas was able to combine his philosophical-scientific interests with an active political career; he was a leading statesman of Tarentum and served as a successful general.

1 Life

When Plato, on his third trip to Sicily, was forcibly detained in Syracuse by Dionysius II, he requested the help of Archytas and other friends in Tarentum, who sent a ship to rescue him. This took place in 361/360 BC, which locates Archytas' activity in the first half of the fourth century BC. (The label 'Presocratic', often used of him, describes Archytas' intellectual, rather than his strictly chronological, position.) Tarentum had continued as a stronghold of Pythagoreanism (§1) after the general dispersal of the Pythagoreans and their emigration from southern Italy. Archytas, who supposedly studied with Philolaus, devoted his interests chiefly to mathematics, musical theory and mechanics. His stature as a leading Pythagorean thinker was such that Aristotle wrote three separate treatises about him. In addition to his philosophical-scientific enterprises, Archytas achieved renown as a military commander of Tarentum, earning continual reappointments beyond the usual terms of office.

2 Mathematics and music

Archytas is famous for his geometrical solution to the problem of doubling the cube. This long-standing problem, which may originally have arisen among the Greeks from architectural consideration of how to double a solid body while retaining its shape, had been reduced by Hippocrates of Chios to that of finding the two mean proportionals. Building on Hippocrates' insight, Archytas solved the problem by means of moving, three-dimensional constructions (half-cylinders and cones), thus also introducing the concept of movement into geometry (previous Pythagoreans had not concerned themselves with motion). This has earned him a place in the annals of mathematics. But Archytas is of no less significance to historians of philosophy for at least two reasons: first, because he makes evident the high degree of sophistication that mathematics had attained by the fourth century BC, against which background the mathematical activities of Plato and his associates in the Academy must be understood; second, and more generally, because although his mathematics far surpasses in complexity the number speculation of early Pythagoreanism, Archytas none the less gives the clearest expression of the Pythagorean view that mathematics provides the philosophical key for the understanding of all of nature. The cosmic application of mathematics appears more pronounced in Archytas than in his fellow, non-Pythagorean Greek mathematicians (for example, Hippocrates of Chios, Eudoxus and, later, Euclid). The following fragment reveals the universal importance that Archytas assigned to mathematical insight:

> Mathematicians seem to me to have excellent discernment, and it is not at all strange that they should think correctly about the particulars that are; for inasmuch as they can discern excellently about the nature (*physis*) of the universe, they are also likely to have an excellent perspective on the particulars that are. Indeed, they have transmitted to us a keen discernment about the velocities of the stars and their risings and settings, and about geometry, numbers [arithmetic], sphericity [astronomy], and, not least of all, music. These seem to be sister sciences, for they concern themselves with the first two related forms of being [that is, number and magnitude].
> (fr. 1)

Mathematics is thus foundational for correct thinking about being. The view of number as an all-powerful explanatory concept for the orderly arrangement of the universe originated from the Pythagoreans' discovery of the numerical ratios governing musical harmony and seemed to them to be corroborated by the observation that

figures and shapes could be expressed arithmetically: for example, the line by two, the triangle by three, the pyramid by four points (see Pythagoreanism §2). That even three-dimensional bodies could in one way be accounted for by an aggregate of points led to a certain fusion of mathematical and physical properties in Pythagorean philosophy, allowing Aristotle to say of the Pythagoreans that 'they construct the whole universe out of numbers - only not numbers consisting of abstract units; they suppose the units to have spatial magnitude' (*Metaphysics* 1080b18-20). Archytas reports of another Pythagorean, Eurytus, that he arranged a number of pebbles to represent the figures of man or horse, and after counting the pebbles declared that such was the number of man and such of horse. Pythagorean number theory, even in the crude form it assumed in the pebble arithmetic of Eurytus, comes to a legitimate fruition with Archytas. He viewed geometry, arithmetic, astronomy and music - the classic quadrivium of medieval authors - collectively as 'sister sciences' (as later Plato would call astronomy and harmonics, expressly citing Pythagorean precedent (*Republic* 530d)), since they all have to do with number or numerical relations: geometry and arithmetic for obvious reasons, astronomy because it was treated mathematically, notably when the properties of the sphere were studied as a geometrical model to explain the movements of the celestial sphere, and music because it involved numerically expressed harmonic proportions. His high regard for these sciences was governed by the conviction - still held in modern science, whose theses often take the form of equations and formulas - that number supplies the precise, quantitative measures by which to comprehend the world.

Fragment 1, which concerns the universality of mathematical insight, forms the introduction to a work that is variously entitled *On Mathematics* or *On Harmonics*. Indeed, Archytas immediately continues to discuss the relation between pitch and frequency, citing a series of examples to show that swift movements produce high notes and slow movements low notes (for example, a stick moved at different speeds produces variations in the pitch of the sound, or the air emitted from the upper holes of a pipe yields higher notes than that from the lower holes). While Archytas' account also contains some inaccurate conclusions from his observations (the speed of the motion that produces a sound was confused with the speed of the sound itself), his acoustic theories are none the less informative about the type of rudimentary empirical investigation that characterized Presocratic science. Moreover, Archytas' acoustics provide an interesting footnote to Plato: discussing physical sense-experience in the *Timaeus* (67b, 80a), Plato appears to rely on Archytas to explain hearing and sound (where again the speed of the propagation of sound is confused with frequency: higher notes are said to reach the ear more quickly than lower notes).

In his treatment of harmonics proper, Archytas further developed Pythagorean musical theory (see Philolaus §5). He calculated the numerical ratios of the intervals in all three scales of the tetrachord (diatonic, chromatic and enharmonic) and specified a doctrine of 'means' to elucidate the connection of proportion and music. The three basic means are the arithmetic (in 6, 9, 12, the difference between the first and the second number equals that between the second and the third), the geometric (in 2, 4, 8, the ratio of the first to the second corresponds to that of the second to the third) and the subcontrary or the harmonic (in 6, 8, 12, the proportion of the first by which the second, the harmonic mean, exceeds the first ($\frac{1}{3}$) is the same as the proportion of the third ($\frac{1}{3}$) by which the third exceeds the second). The knowledge of the means is presupposed by Plato when in the *Timaeus* (35b-36b) he divides the world-soul into harmonic intervals.

However, Archytas' emphasis on means, as evidenced both in his drawing upon the mean proportionals to explain the doubling of the cube and in his determining the means of the musical proportions, goes beyond the confines of geometry and musicology. A single fragment that preserves Archytas' thoughts on political-ethical matters indicates that he regarded a just society as one ruled by equality in something like the mathematical sense of proportion:

> When calculation has been found, it checks political faction and increases concord, for there is no unfair advantage in its presence, and equality reigns. With calculation we smooth out differences in our dealings with each other. Through it the poor take from the powerful, and the rich give to the needy, both trusting in it to obtain an equal share…
>
> (fr. 3)

Archytas envisions here a society whose equilibrium depends upon right 'calculation' (*logismos*), a word that in Greek also means 'reasoning', but whose root meaning of 'counting' or 'calculating' was never wholly lost to

sight (the plural *logismoi* can in fact be translated as ‘arithmetic’) and such a form would especially be favoured by the mathematical mind of Archytas. Calculation, in its political application, leads (ideally) to figuring out the right proportion between rich and poor, establishing the means, as it were, between them, and thus ensuring political equality (*isotēs*, a term which also refers to mathematical proportion). That Archytas engaged in political reflections with mathematical overtones is not surprising, given that he was both a pre-eminent statesman and a mathematician. His stress on finding the right proportions in both domains make him what may be called ‘the philosopher of means’.

3 Miscellanea

The extent to which Archytas dedicated himself to specific problems of cosmology is not known, although fragment 1 allows the assumption that he brought mathematical insights to bear on physics and astronomy. It was most probably in the course of such pursuits that he took up the question of infinite space. Archytas posed to himself the question as to whether or not, standing at the heaven of the fixed stars (that is, the edge of the world) he could extend his hand or a staff (A24). The implication being that he could, it appears Archytas was trying to lend support to the Pythagorean idea of the ‘unlimited’ outside the heavens (see Philolaus §3).

Besides the theoretical concerns of Archytas, we are further informed of certain practical inventions. He is said to have constructed a wooden dove that could fly and a popular rattle for children to keep them amused and from breaking things in the house. These inventions, the technical details of which are not known, were probably devised in part to illustrate Archytas’ scientific theories, since he was noted for making mechanics systematic by applying mathematical principles.

In sum, although our knowledge of Archytas is comparatively meagre, it reveals one of the most versatile and creative thinkers of the fourth century BC - philosopher, statesman, mathematician and musical theorist combined in one person. Certainly, his indebtedness to previous Pythagoreans, Presocratics and contemporary Greek philosophers cannot be discounted, but despite this he evinces considerable originality. The original cast of his mind is well typified in the following fragment in which he presents, somewhat paradoxically, the philosophical craft as a process of independent discovery:

> To become knowledgeable about things one does not know one must either learn from others or find out for oneself. Now learning derives from someone else and is foreign, whereas finding out is of and by oneself. Finding out without seeking is difficult and rare, but with seeking it is manageable and easy, though someone who does not know how to seek cannot find.

(fr. 3)

Arendt, Hannah (1906-75)

Hannah Arendt was one of the leading political thinkers of the twentieth century. She observed Nazi totalitarianism at close quarters and devoted much of her life to making sense of it. In her view it mobilized the atomized masses around a simple-minded ideology, and devised a form of rule in which bureaucratically minded officials performed murderous deeds with a clear conscience. For Arendt the only way to avoid totalitarianism was to establish a well-ordered political community that encouraged public participation and institutionalized political freedom. She considered politics to be one of the highest human activities because it enabled citizens to reflect on their collective life, to give meaning to their personal lives and to develop a creative and cohesive community. She was deeply worried that the economically obsessed modern age discouraged political activity, and created morally superficial people susceptible to the appeal of mindless adventurism.

1 Life

Born into a Jewish family in Königsburg, Arendt went on to study philosophy, first under Heidegger and Bultmann at Marburg and then under Husserl and Jaspers respectively at Freiburg and Heidelberg. The Nazi rise to power put paid to her academic ambitions and she became active in Jewish politics. She was arrested and detained in 1933, but was soon able to escape to France. She was briefly interned in a French prison camp, from where she escaped to the USA in 1941. She held various academic positions there, the last at the New Centre for Social Research. She regularly wrote on public issues but was not otherwise politically active.

2 *The Origins of Totalitarianism*

Arendt made her name with *The Origins of Totalitarianism* (1951), a somewhat misleading title for a book that was concerned not only with totalitarianism but also with the rise of anti-Semitism, imperialism and racism, the ‘three elements of shame’ in the modern age as she called them. She argued that Nazi and Stalinist totalitarianism represented a wholly new form of rule based on ideology and its twin terror. Ideology, the *logos* of an idea, centred around a specific idea, be it race, class or nation. It teased out the logical implications of the idea, built a tightly knit system around them, and sought to reconstruct a polity on that basis. This necessarily involved terror, by which Arendt meant a systematic, institutionalized, carefully planned and legally unrestrained use of physical and psychological violence. In Arendt’s view totalitarianism found a fertile soil in an environment in which society had been dissolved into loose and rootless masses and the hollowed out state had been reduced to an unrestrained coercive apparatus. For her, totalitarianism, born out of the rejection of the ordinary world as we know it, had its paradigmatic expression in concentration camps - a mechanical, impersonal and unworldly ‘world’ utterly devoid of thinking, feeling, judgment, personal identity, privacy and all else that distinguishes human existence (see Ideology §1; Totalitarianism §2).

The Origins of Totalitarianism was an important work. It offered brilliant insights into the nature and role of political institutions, the inner contradictions of the modern nation-state, and the human need for rootedness. But it also had its weaknesses. Arendt treated totalitarianism as an independent and self-subsisting phenomenon relentlessly unfolding its inner logic and subject to no human constraints. She uncritically equated the Nazi and Stalinist ‘forms’ of totalitarianism, and her analysis was underpinned by theories of man and society that were nowhere clearly stated and defended. In her subsequent writings Arendt often returned to the large philosophical questions raised by the Nazi experience but inadequately explored in *The Origins of Totalitarianism*. She asked such questions as what it meant to be human, how we should live both individually and collectively, in what kind of world it was possible to lead a meaningful life, why human beings committed evil, how thinking was related to action, and what future modernity held in store for humankind.

3 *The Human Condition*

Arendt first dealt systematically with some of these questions in *The Human Condition* (1958). She distinguished two kinds of life, the *vita activa* and the *vita contemplativa*, and concentrated on the former. For her, humans are a part of nature and subject to its necessity, but are also able to transcend it and act in a truly free and gratuitous manner. She divided human activities into labour, work and action, each presupposing but going beyond and hence higher than the preceding one. Labour referred to the familiar daily round of activities centred around the

production and reproduction of life. Work referred to activities in which human beings controlled nature and interposed a durable and distinctively human world between themselves and nature. It included such things as building houses, crafts, writing books, painting pictures and composing music. Action was uniquely interpersonal and referred to activities in which human beings transcended nature, interacted with others, began something new, and made a distinct mark on the world. Action, the unique expression of the human capacities for freedom and transcendence, was a distinctively human achievement; it included such things as speaking, arguing, persuading, taking initiatives, standing up for a cause and protesting against an evil.

Although action occurred in all areas of life, Arendt argued that politics was its ideal home. The political life provided such necessary preconditions of action as a plurality of participants, publicity, public space, shared interests, the inspiring tradition of action and the possibility of immortal fame. By challenging people to ‘dare the extraordinary’ and leave behind an inspiring story that gave meaning to their existence and raised the level of communal life, the political community, a community living together in the mode of acting and speaking, realized the full potential of human existence. For Arendt this was why man was by nature a political ‘animal’.

For Arendt the classical world of Athens and Rome respected the hierarchy of the *vita activa* and nurtured a climate conducive to action, freedom and meaningfulness. The late middle and early modern ages gave the pride of place to work, and admired the craftsman. Modernity reversed the hierarchy and was centred around labour. It was distinguished by such features as an excessive preoccupation with life and its endless wants, a subjectivist morality, the loss of stable structures, the deterministic and process-like character of human existence and the reduction of government to administration. Since modernity did not nurture the necessary climate for action, people in the modern world lacked the opportunity to give meaning to their lives, and either led meaningless lives or sought a pseudo-meaning in following the allegedly objective laws of history.

4 Later works

After *The Human Condition* Arendt wrote several books, all containing stimulating insights but lacking in philosophical rigour and penetration and none matching its imaginative power. In 1961 she published *Between Past and Future*, a collection of six essays of varying quality. She explored the nature of political authority, freedom, political judgment and culture in greater detail than before, and showed her growing sympathy for Kant. She insisted that political thinking was public and representative in character and involved looking at a subject from a variety of different standpoints. The greater its range and imaginative sympathy, the more representative and valid was the resulting opinion or judgment.

In 1963 Arendt published *On Revolution*, bubbling with suggestive but sketchily explored ideas and showing signs of hurry. She argued that revolution, one of the highest forms of political action, was modern in origin and aimed to establish a secure framework of freedom. Since it was political in character, it succeeded in the USA where it did not overstep its limits, and failed in France where the revolution of 1789 was subverted by concern over the problem of poverty. In her view even the American Revolution was only a partial success. By failing to give a constitutional status to local assemblies and town hall meetings, it discouraged active political participation and the development of public spirit. Thanks to several factors, including the enormous influence of Karl Marx, the greatest theorist of revolution, it was not the American but the French Revolution that became the model of all subsequent revolutions, including the Russian revolution of 1917. For Arendt, they were all doomed from the start. She pleaded for a fuller appreciation of the ‘lost treasures’ of the revolutionary tradition, especially its concern to set up a participatory polity constructed from the bottom upwards (see Revolution §2).

In 1963 Arendt also published *Eichmann in Jerusalem* based on the Israeli trial of a prominent Nazi. Eichmann was a Nazi officer who dutifully carried out his superior’s orders and murdered several thousand Jews in one of the German concentration camps. Modifying some of her views in the *Origins of Totalitarianism*, she argued that Eichmann’s enormous crimes proceeded not so much from wickedness as from sheer thoughtlessness. He did not personally hate the Jews, nor was he a sadist or an evil man. All he did was mechanically to carry out his bureaucratic duties out of a blind sense of loyalty to the *Führer*, without once pausing to reflect on the enormity of what he was doing. His evil had neither moral depth nor deep roots in his psyche, and lacked the power to fascinate. He was a boring, banal and morally superficial man whose evil deeds, although not done inadvertently, had no deeper meaning for him and were incidental to his murderous job. Arendt’s book aroused heated controversy and made her a pariah in several Jewish and even non-Jewish circles. Her analysis was not wrong but

partial. It took no account of the passionate and fiercely moralized anti-Semitism of Nazism, did not explain why Eichmann did not think about what he was doing, and failed to explore the deeper nature and sources of evil (see Holocaust).

In the late 1960s, Arendt increasingly returned to an exploration of the *vita contemplativa* to which she had hitherto paid only cursory attention. The result was her posthumously published *The Life of the Mind* (1978). The work was intended to be in three volumes, devoted respectively to the analyses of the nature of and interrelations between the three basic human capacities to think, will and judge, but she managed to finish only the first two. For her the *vita contemplativa* took two forms, namely thinking and knowing, paradigmatically expressed in philosophy and science respectively. Thinking is concerned with a quest for meaning or significance, knowing with a search for truth. Science inquires into 'what is', and is motivated by a passionate love of truth, while philosophy inquires into 'what it means for it to be' and is motivated by an equally passionate love of wisdom. Science is analytical and investigative, philosophy reflective and meditative. Science offers hard conclusions, whereas philosophy is tentative and endlessly exploratory and, like Penelope's web, begins the day by unscrambling the certainties of the previous night. Science remains confined to the world, while philosophy transcends it and is a unique expression of human freedom.

Given her view of thinking, Arendt had some difficulty relating it to both willing and action. Willing was a worldly faculty involving other people, a wish to change the world, and a measure of moral certainty; by contrast, thinking was solitary, tentative and inconclusive. Arendt neither satisfactorily resolved their tension nor showed how the two were mediated. She faced a similar difficulty in relating thinking and action to philosophy and politics. She was puzzled as to why many philosophers displayed a great hostility to the politics of a free society and supported authoritarian rule. Sometimes she explained this in terms of the philosopher's inappropriate ambition to discover the truth about the world and to 'coerce' people into accepting it by the 'force' of logic. For the most part she stressed philosophy's solitary and unworldly nature which made it impatient of the plurality, unpredictability and the apparent chaos of political life. The latter view implied that the philosopher and the political community could never be at peace with each other, and that political philosophy was impossible. Arendt found the conclusion unpalatable, but could not see an alternative.

Arendt was a highly original thinker, who made substantial contributions to political philosophy. She offered a body of profound insights into the nature, structure and role of political life, developed a wholly new vocabulary, explored long-neglected dimensions of political experience, and highlighted some of the seductive but dangerous aspects of modernity. She helped sustain the tradition of political philosophy at a time when it was in a state of decline by asking new questions, offering new ways of answering old ones, and showing that a systematic political philosophy did not have to result in an elaborate system.

Aretē

A pivotal term of ancient Greek ethics, aretē *is conventionally translated 'virtue', but is more properly 'goodness' - the quality of being a good human being. Philosophy came, largely through Plato, to recognize four cardinal* aretai*: wisdom (*phronēsis*), moderation (*sōphrosynē*), courage (*andreia*) and justice (*dikaiosynē*). Others, considered either coordinate with these or their sub-species, included piety, liberality and magnanimity. The term generated many controversies. For example, is* aretē *a state of intellect, character or both? Does it possess intrinsic or only instrumental value? Is it teachable, god-given or otherwise acquired? Is it one thing or many? If many, how are they differentiated, and can you have one without having all?*

In ordinary Greek, *aretē* functions as the abstract noun correlated with *agathos*, meaning 'good', and 'goodness' is in most contexts a correct translation. However, 'goodness', unlike *aretē*, lacks a plural, and so requires awkward periphrases such as 'kinds of goodness' or 'ways of being good'. Hence 'virtue(s)' (sometimes 'excellence(s)') is usually preferred. Similarly, 'vice(s)' is favoured for its opposite, *kakia*, more correctly rendered 'badness'. In early Greek, *aretē* has no narrowly moral use, but is contextualized to mean prowess in any field - athletic, military, political, and so on. Given the predominance of male values, it often approximates to 'valour'. This is reflected in its eventual Latinization as *virtus*, literally 'manliness', which has made 'virtue' the almost inevitable modern rendering.

A specifically moral use of *aretē* emerged gradually in the fifth and fourth centuries BC. The centrality of civic obligations in the Greek (especially the Athenian) value system gave cooperative virtues such as justice and courage a special standing, even before philosophers like Socrates and Plato began to scrutinize them. Many of the Sophists professed to teach *aretē* to the young (see Sophists). How if at all it could be acquired was a much-debated issue: would it be by teaching, practice, nature, divine favour or sheer luck?

Whereas modern virtue ethics tends to stress the culture-specific character of virtue implicit in such a background (see Virtue ethics), Greek thought rarely acknowledged this, and sometimes explicitly denied it. The dominant concern was to investigate goodness as a universal human property or ideal.

Aretē is above all functional goodness. In Plato, *Republic* I, Socrates investigates the 'goodness' of a soul by direct analogy with that of an eye: just as the *aretē* of an eye is what enables it successfully to perform its function, seeing, so the *aretē* of a soul is what enables it successfully to perform its own function, living. Aristotle's conception of *aretē* is founded on the analogous idea that there is a distinctively human function, which can be performed better or worse (see Aristotle §21). All this points to the intimate link between *aretē* and 'living well', a regular equivalent of 'happiness' (see Eudaimonia).

One recurring issue is the nature of that link. Socratic thought tended to make *aretē* and happiness extensionally equivalent. Aristotle's modification was to locate happiness in the active use of virtue, not its mere possession. A third tradition, sketched in Plato's *Protagoras* and later fully developed in Epicureanism, gives *aretē* purely instrumental value, as the prudential skill of maximizing the one intrinsic good, pleasure (see Epicureanism §10).

Socrates, on Plato's usual portrayal of him, has little sympathy with this instrumentalist account, but does favour one feature of it, the identification of *aretē* with some sort of knowledge or wisdom. Nothing is valuable unless used wisely; hence wisdom is the only underivatively valuable thing.

In Plato's *Protagoras*, Protagoras himself considers the political *aretai* - justice, courage and so on - to be innate human potentialities which can be realized by training. He sees them as separate capacities, so that someone might become, for example, brave but not wise. This separability assumption may well have been widespread, but philosophers in the wake of Socrates formed a united front against it. In the *Protagoras*, Socrates treats *aretē* as a single thing, never using the plural, and argues that justice, moderation and so on are not its 'parts' (perhaps meaning species?) but coreferential terms for it. This strong thesis of the Unit of Virtue was developed in the later Socratic tradition, especially by the Stoic, Ariston of Chios (§3), who maintained that 'justice', 'courage' and so on are all names for a single state of psychic health, differentiated purely by the contexts to which its possessor responds (apportionment, danger…). A version of the same thesis - in effect, that there is just one way of being a good person - is applied by Socrates in Plato's *Meno* to gender and class distinctions: the *aretē* of men and women,

free and slaves, is one and the same; they are all good in the same way.

Others considered the several *aretai* to be essentially distinct states of the person, but still inseparable. For mainstream Stoicism, this arose from the analysis of them as exact sciences, each with its own defining concerns, but made interdependent by their shared stock of theorems (see Stoicism §16). In the case of Plato and Aristotle, it was arrived at by concluding, *contra* Socrates, that the soul has emotive components as well as reason, and that moral *aretai* consist in a properly balanced relation between emotion and reason. Consequently the various *aretai* admit of complex analyses which enable them to be more clearly differentiated. For Plato in *Republic* IV, there are three psychic components - one rational, one spirited or competitive, one appetitive - and each of the cardinal *aretai* consists in a different relation between them. For Aristotle, each *aretē* is an educated disposition to make choices which strike a mean between excess and deficiency, especially in the relevant emotions; the rational component lies in the 'practical wisdom' (*phronēsis*) with which the choices must be informed (see Aristotle §§22-4).

The conception of *aretē* varied with the conception of human good. In his more other-worldly moods, especially in the *Phaedo*, Plato located true *aretē* in the soul's purification from bodily concerns and return to its natural discarnate state of purity and wisdom. This emphasis on intellectual (as distinct from moral) *aretē*, later taken up in earnest by Neoplatonism (see Neoplatonism) is also reflected in Aristotle. To *aretai* of character ('ethical' *aretai*) Aristotle adds intellectual *aretai*, including not just practical wisdom but also pure wisdom (*sophia*). The highest form of happiness, the life of contemplation, is achieved by concentration on the latter.

Argentina, philosophy in

Philosophy has been present throughout Argentine cultural life since the beginning of Spanish colonization. Despite institutional ups and downs, the teaching of philosophy was a practically constant component of higher and even secondary education. The principal currents that shaped that teaching for more than three centuries were Scholasticism, French ideology, eclectic spiritualism, positivism and in the twentieth century, all of the contemporary manifestations, such as, Husserlian phenomenology, existentialism, analytical philosophy and structuralism. A permanent characteristic, nevertheless, has been that the political vicissitudes of the country affected educational institutions.

In the nineteenth century, during the period of national independence and organization, public figures used philosophical ideas to analyse the problems of society and to make the political and institutional contributions that a country in formation required. Juan Bautista Alberdi and Domingo Sarmiento are, in this respect, two representative examples.

In the twentieth century, the figure of the professional philosopher, one who is interested in philosophical research for itself, emerged and expanded. However, thought that reflected direct interest in the problems of the community and in the ethical demands of praxis did not disappear during this era. This can be seen in such thinkers as José Ingenieros and Alejandro Korn and more recently in what has been called liberation philosophy.

Academic philosophy has made considerable progress. In the second half of the twentieth century, it has attained a high level of professional quality. In some cases, even original contributions have been made which go beyond assimilation or commentary about external philosophical influences.

In Argentina, as in the rest of Latin America, philosophy began as a pure transplant brought by those who conquered the continent. Upon creating centres of higher education (either as part of the religious orders or with the character of universities), the philosophical teaching being practised in the Spanish universities of Salamanca and Alcalá was reproduced in the Spanish colonies.

Argentine philosophy shares the same general characteristics and historical periods with the philosophies developed in other Latin American countries. In general terms, philosophy can be divided into three periods: the colonial period, the nineteenth century, or national period and the twentieth century.

1 The colonial period

Philosophical activity during the colonial period was exclusively didactic. The subject matter taught was Scholastic philosophy, which had predominated in Europe during the Middle Ages and continued to exist in Spain in a renewed form well beyond the Renaissance period. Those who transmitted this knowledge were members of the Church.

The teaching of philosophy began at the University of Córdoba in the seventeenth century. However, the first indications that allow us a better idea of its content come from the eighteenth century.

Following medieval tradition, the teaching of philosophy was imparted in the College of Arts where ‘grammar’ students who had studied Latin, the language of instruction, were admitted. The subjects taught were logic, physics, metaphysics and ethics. The study of the arts was necessary to enter into the course of study of the highest distinction, theology, law or medicine, where these were available.

Although scholastic philosophy in the River Plate lasted until the dawn of the nineteenth century, in the eighteenth century there was a perception of the advance of modern natural science and its consequences for the worldview of the time which was based on the science of Aristotle. Thus, there were attempts to accommodate traditional teaching to the new modalities. Some Jesuit professors at the University of Córdoba (before the expulsion of the order in 1767) were up-to-date on the ‘new physics’ without this altering the institution of scholastic metaphysics. In the Franciscan era (from the expulsion of the the Jesuits until 1808) at the same university, modern figures such as Descartes were discussed, but not always with the approval of their doctrines. Meanwhile, in Buenos Aires education at the San Carlos School was kept on a more traditional level.

2 The nineteenth century

Generally, in all Latin American countries after their declaration of independence, there was a long period of political instability often accompanied by bloody civil wars. Argentina was no exception. However, philosophy was not absent in the fifty years that followed the separation from Spain; that is, before the country was unified and began its march towards modernization and material progress, around 1860.

At the beginning of the nineteenth century there were calls to introduce the new philosophical and scientific currents into the curriculum. To begin with more practical studies linked to scientific progress were being requested. Such was the case of a new plan of studies prepared in 1813 by Gregorio Funes, rector of the University of Córdoba. Funes proposed limiting the duration of courses in logic and metaphysics to provide for an entire year dedicated to the study of mathematics, signalling a great innovation.

In 1819 at the School of the Union of the South (a continuation of the San Carlos School) Juan Crisóstomo Lafinur initiated a new era of teaching philosophy in Argentina. The content of that teaching was French ideology and classes began to be taught in Spanish. Juan Manuel Fernández de Agüero and Diego Alcorta continued the same trend until 1842 at the University of Buenos Aires. The philosophy taught was the sensualism of Etienne Bonnot de Condillac and the ideas of the French ideologues, especially Pierre-Jean Cabanis and Destutt de Tracy.

In the nineteenth century the first manifestation of a personal philosophical expression which was not derived from university teaching was the work of Juan Bautista Alberdi (1810-84), a public figure known for his contribution to the drafting of the Argentine constitution of 1853. Alberdi found ideology inadequate and was open to the influences of Cousin, Jouffroy, Lerminier and Leroux. He had a pragmatic view of philosophy in the sense of considering that philosophical studies in Latin American countries should be applicable to concrete problems of those countries: their art, laws, politics and industry. This provides the basis for a possible Spanish American philosophy in which a certain line of current Latin American thought finds an antecedent. The most important philosophical writing of Alberdi is his *Fragmento preliminar al estudio del derecho (Prologue to the Study of Law)* (1837). In this work he maintains that each society should address its own reality: the course of history has its own defined periods and each people should know the one in which they find themselves to apply authentic rather than imitative solutions to their problems. *Fragmento preliminar al estudio del derecho (Prologue to the Study of Law)* is also a philosophy of law that deals with natural and positive law and the theory of jurisprudence. The theoretical framework is borrowed primarily from Jouffroy and Lerminer.

In the nineteenth century other European currents were also present, like French eclecticism and Krausism. Eclectic spiritualism was represented in the secondary teaching of philosophy by French manuals from that school. Krausism, whose presence became notable around 1870, was adopted in the fields of pedagogy and law (see Krause, K.C.F.).

3 The twentieth century

The first Argentine philosophical movement which was widely disseminated and involved various major figures was positivism. In the Argentine case, this term implied that which was understood in Europe under that name (the doctrines of Comte and Spencer), but also the influence of Darwinian biological evolutionism and a high regard for the type of explanation provided by the natural sciences. The combination is more of a positivist or scientific naturalism than a positivism in the strict sense (see Positivist thought in Latin America).

There were positivist followers of Comte in Argentina, such as Alfredo Ferreira (1836-1938), who founded the Argentine Positivist Committee in 1924. Ferreira was principally an educator and despite adhering to the religion of humanity, his association with Comte was not dogmatic.

Darwinism was represented principally by the paleontologist Florentino Ameghino (1845-1911), who culminated vast scientific work in a brief text, 'Mi credo' (My Creed) (1915), in which he expressed his materialist and scientistic *Weltanschauung*.

The greatest individual figures of Argentine positivism are Carlos Octavio Bunge (1875-1918) and José Ingenieros (1877-1925), especially the latter. Bunge is not easily categorized in a particular positivist orientation. He applied his points of view to three principal themes: psychology, ethics and law. The ultimate tenets of his position in the three cases are biological. Ingenieros was a psychologist and psychiatrist of international renown

besides being a philosopher. He defended a moral idealism in his works, widely read throughout Latin America, such as *El hombre mediocre (Mediocre Man)* (1913a) and *Las fuerzas morales (Moral Forces)* (1925). His two principal philosophical works are *Principios de psicología (Principles of Psychology)* (1913b) and *Proposiciones relativas al porvenir de la filosofía (Propositions Relative to the Future of Philosophy)* (1918). The psychology of Ingenieros is of a naturalist nature and specifically biological, with clear application of Darwinian theory. In his work biology is explained in terms of energy, following Wilhelm Ostwald (1853-1932). This position did not prevent Ingenieros from considering that authentic philosophical problems were outside the field of science. In this sense, in his aforementioned *Proposiciones relativas al porvenir de la filosofía (Propositions Relative to the Future of Philosophy)*, he identifies philosophy with metaphysics, understanding philosophy as the realm of hypotheses that go beyond experience, but depart from it and cannot contradict it. This thesis represents one of the first expressions of the transition towards the next phase of the surpassing of positivism, which developed in the warm glow of new European philosophical trends, through forms of transition represented by Fouillé and Guyau, for example, and later through the enormous prestige of Bergson and Croce. In this transition two factors were pivotal: the founding of the School of Philosophy and Humanities of the University of Buenos Aires in 1896 and the first visit of José Ortega y Gasset to Argentina in 1916, with his prestige and the dissemination of the new European currents.

Following the example of Rodolfo Rivarola in the newly founded School of Philosophy and Humanities, who was interested in the thought of Kant, the two primary figures who were influential in the change of philosophical atmosphere were Coriolano Albernini (1886-1960) and Alejandro Korn (1860-1936). The first had a decisive influence on university life; the second has become a classic of Latin American philosophy. The criticism by Albernini of positivism was caustic and effective. Korn constructed his philosophy on the basis of the freedom of ethical conduct and rejected in that field the determinism of positivist naturalism (see Anti-positivist thought in Latin America). For Korn, freedom makes possible the moral voluntarism that facilitates human excellence. In addition to Albernini and Korn, Alberto Rougès (1880-1947), from the interior of the country, wrote *Las jeraquías del ser y la eternidad (Hierarchies of Being and Eternity)* (1943), one of the most important works of Argentine philosophy in the first half of the century.

Around 1940 when positivism had clearly been left behind, a new phase of Argentine philosophy began that has lasted despite its lack of uniformity over the course of its development. Its principal characteristics amount to a considerable increase in philosophical activity, especially in the number of people engaged in philosophy, the number of university professorships and the number of journals and publications; philosophical activity being carried out primarily in universities; an increase in the quality of professional training of philosophical practitioners and an openness to all the currents and problems of Western thought.

The first part of this phase witnessed the influence of German philosophy from the first decades of the century: Husserl and his direct disciples of the phenomenological school, along with Scheler, Hartmann and Heidegger. Such was the case of Francisco Romero (1891-1962), who developed his own philosophical position stemming from Scheler and Hartmann. In his day, Romero was considered one of the major Spanish-speaking philosophers. His position culminated in the publication of his principal work, *Teoría del hombre (Theory of Man)* (1952), which is a philosophical anthropology based on the concept of intentionality. He also outlined the fundamentals of axiology, a theory of culture and a metaphysics of transcendence. Various figures can be linked to Romero: Risieri Frondizi (1910-83), one of the few members of this group who was influenced by English-language philosophy and whose principal work is a theory of values; Aníbal Sánchez Reulet, who examined philosophy as a problem in *Raíz y destino de la filosofía (The Root and Destiny of Philosophy)* (1942) and Eugenio Pucciarelli (1907-95), who investigated the problems of reason, time and technique.

Carlos Astrada (1894-1970) and Luis Juan Guerrero (1896-1956) also moved into the realm of German philosophy. Astrada developed an extensive body of work influenced by Heidegger and concluding in Marxism. Guerrero developed a detailed aesthetics. For his part, Carlos Cossio (1903-87) developed his ‘egological theory of law’ in *La teoría egológica del derecho y el concepto jurídico de libertad (The Egological Theory of Law and the Juridical Concept of Freedom)* (1944) derived from Husserl, Heidegger and Kelsen.

Close to existentialism one finds Vicente Fatone (1903-62) and Miguel Angel Virasoro (1900-66). Fatone was one of the most outstanding expositors of existentialist philosophy, but also dealt in Hindu doctrines and philosophy of

religion. Oriental thought as well as philosophy of religion have also been studied by subsequent researchers. Virasoro combines the influence of Hegel and that of existentialism. In addition, Angel Vassallo developed themes that came from the great Western metaphysicians and from Blondel and Marcel (see Existentialist thought in Latin America).

The work of Juan Adolfo Vázquez is characterized by a high degree of interest in metaphysics and an affinity for the mystical. Following Fatone, Víctor Massuh continued the study of philosophy of religion, while Adolfo Carpio of Romero's group, authored a work of Heideggerian bent about the significance of the history of philosophy.

With respect to Catholic thought, the Thomist thinker of the most substantive work and the greatest renown is Octavio Derisi. An important Thomist figure in Córdoba was Nimio de Anquín, who wrote about ancient and medieval philosophy as well as contemporary thought. Two Jesuits who came later and who produced considerable bodies of work are Juan Sepich and Ismael Quiles. In the context of the great dissemination of existentialist philosophy, the latter developed his theory of 'in-sistentialism'. Similar to Nimio de Anquín, although a generation later, is Alberto Caturelli, who developed a metaphysics opposed to modern and contemporary immanentism. One should also note Diego Pró, who has worked with Aristotelian thought, and like Caturelli is the author of numerous studies about philosophy in Argentina.

Moving away from the predominance of French and German influences, a group of followers of English-speaking analytic philosophy was formed in the early 1970s. In 1972 the Argentine Society of Philosophical Analysis was founded, which brought together philosophers of varying thematic interests but with great *esprit de corps* and keen awareness of their difference from representatives of other movements. This group is in close contact with its counterpart in Mexico, which publishes the journal *Crítica*. This movement is characterized by a distrust of metaphysics, an interest in the accomplishments of science and in linguistic problems and an attempt to produce rigorous conceptual analyses. Similarly opposed to the majority of other currents in Argentina, but a thinker who is an independent figure of considerable international prestige, is the philosopher of science, Mario Bunge, who settled in Canada (see Analytical philosophy in Latin America).

At the beginning of the 1970s the philosophy of liberation movement began in Argentina and later spread throughout Latin America. It was considered by many to be the most authentic expression of Latin American thought. This style of philosophy sought to be distinguished from traditional academic forms, to hold that philosophy is justified only by immediate engagement with praxis and to maintain as its principal focus the question of the dependence of Latin America. This philosophy promotes the liberation of the region and that of its most overlooked sectors (the masses, the oppressed, the poor). It has natural affinities with theology of liberation. The first synthesizing overview of the movement was the work of Horacio Cerutti Guldberg, *Filosofía de la liberación latinoamericana (Latin American Philosophy of Liberation)* (1983). The criticism that the book contains about other members of the movement and the responses of the latter to the criticisms, illustrate the internal differences in the movement. However, aside from those differences, philosophy of liberation taken as a whole has a well-defined profile at the forefront of Argentine and Latin American thought (see Liberation philosophy; Liberation theology).

Dialectical materialism did not produce theoretical works of consequence in Argentina, but the founder of the Argentine Socialist Party and translator of Marx, Juan Justo (1865-1928) combined Marxism with biology and Darwinism in his work. Aníbal Ponce (1898-1938), who was a disciple of Ingenieros, moved from the biological orientation of his teacher to a Marxist position.

Recent philosophical activity is characterized by an intensification of the themes indicated as belonging to the post-1940 era. The international philosophical movement is experienced with first-hand immediacy and many philosophers are in a position to participate fully in international philosophical dialogue. In some cases, affinities of ideas and philosophical positions are reflected in institutional groupings or in publications that represent them. For example, the journal *Análisis Filosófico (Philosophical Analysis)* is for the analytic group, the Centre for Philosophical Studies is affiliated with the *Revista latinoamericana de filosofía (Latin American Journal of Philosophy)*, the National Academy of Sciences with *Escritos de filosofía (Philosophical Writings)*. This philosophical activity is not carried out solely in Buenos Aires, but also in various state and private universities in the rest of the country.

Part of the historical-philosophical task is devoted to Argentine and Latin American thought. The two classics of the history of ideas in Argentina are *La evolución de las ideas argentinas (Evolution of Argentine Ideas)* (1918-20) by José Ingenieros and *Influencias filosóficas en la evolución nacional (Philosophical Influences on National Evolution)* (1936) by Alejandro Korn. The most recent and complete panorama of the development of philosophy in the country is contained in the work of Francisco Leocata, *Las ideas filosóficas en Argentina (Philosophical Ideas in Argentina)* (1992, 1993). Among the outstanding authors who specialize in Argentine and Latin American thought are Gregorio Weinberg (1995) (history of education and science) and Arturo Roig (1981). The work of the latter, in addition to its historiographic importance, is considered a major contribution to the philosophical interpretation of Latin America. There are professorships of Argentine thought at the universities of Buenos Aires, La Plata, Córdoba, Tucumán and Mendoza where the journal *Cuyo: Anuario de historia de la filosofía argentina y americana (Cuyo: Journal of the History of Argentine and Latin American Philosophy)* has been published since 1965.

Since the beginning of the century, various foreign professors have contributed to the formation of contemporary Argentine philosophy. Perhaps the most notable is the Italian historian of philosophy Rodolfo Mondolfo.

Aristippus the Elder (*c*.435-*c*.355 BC)

Aristippus of Cyrene was a member of Socrates' entourage who after Socrates' death (399 BC) founded the Cyrenaic school. He was primarily interested in practical ethics. He focused on the concepts of pleasure and pain, and classed them as bodily motions of which we are conscious. He considered pleasure a major component of happiness, but also attributed intrinsic value to virtue and emphasized the importance of study and exercise as means to self-control.

Aristippus, son of Aritades, was born at Cyrene. He moved to Athens at a young age, where he became an associate of Socrates and also frequented Sophistic circles (see Sophists). After Socrates' death, he taught philosophy during his numerous travels to Syracuse, Asia Minor, Corinth, Megara and Aegina, and probably returned to Cyrene towards the end of his life. It may have been there that he founded the Cyrenaic school (see Cyrenaics) and that he trained his daughter, Arete, in philosophy. He must be distinguished from his grandson and second successor as head of the school, Aristippus the Younger (born *c*.380 BC), with whom he is occasionally confused.

Some sources maintain that he wrote nothing at all, perhaps in deliberate imitation of Socrates. But our most reliable informants report that he wrote several dialogues and a history of Libya in three books. The titles attest a vivid interest in practical ethics, but also a concern for rhetoric, history, literature, linguistic morphology and semantics. His argument establishing that no morally neutral object exists may be taken to indicate an additional interest in theoretical ethics. He disallowed the study of mathematics and of physics, but recognized that logic may be useful in so far as it sharpens our dialectical capacities.

Few tenets can be ascribed to Aristippus with confidence. It seems that he had no detailed epistemological views; the Cyrenaic theory of knowledge was probably formulated by his grandson. However, he focused on the notions of pleasure and pain which he classed as *pathē*, ways of being affected, and described them in terms of smooth and rough motions of the flesh which result in sensation. These *pathē* are short-lived due to their kinetic nature: the motions associated with them expire with time. To this extent, Aristippus foreshadows Cyrenaic subjectivism, which equated the *pathē* experienced in the present moment with bodily motions detected by 'internal touch', self-evident and incorrigibly known.

Regarding Aristippus' ethics, the evidence is divided. According to one tradition, he was a hedonist who defined bodily pleasure experienced in the present moment as the moral end, and thus formulated the core of the ethical doctrine held by his grandson and by the orthodox branch of the Cyrenaic school (see Hedonism). However, according to a second group of sources, he never defended a particular moral doctrine but only gave the impression of being a hedonist on account of his numerous lectures on pleasure and of his voluptuous life. There are good reasons for accepting this latter testimony: Aristippus attributed intrinsic value to virtue, and this is incompatible with a straighforward hedonism positing the short-lived pleasures of the present moment as the only intrinsic good; he emphasized the importance of study, exercise and self-control, all of which have non-pleasurable aspects; he recommended the enjoyment of bodily pleasures only if they do not endanger one's control over oneself; and he tended to look at his life as a single whole, not as a series of discrete pleasurable episodes, as is exemplified by his assertion that he aimed 'at the easiest and pleasantest life'. Such evidence indicates that Aristippus was a eudaemonist who considered pleasure the major component of happiness and spoke of happiness in terms of a pleasurable condition extending over one's lifetime (see Eudaimonia).

This conception of happiness influenced his social and political attitudes, which are marked by a strict individualism. He claimed for himself a freedom which entailed the rejection of the political condition of citizenship and abstention from duties and obligations to any particular city. In his view, part of the happiest life is 'to live as a foreigner in every land'.

Ariston of Chios (early to mid 3rd century BC)

The Greek philosopher Ariston (alternatively Aristo), from the Aegean island of Chios, was an exceptionally independent-minded member of the early Stoic school. A pupil of the founder Zeno of Citium, he was among the most prominent philosophers working at Athens in the mid-third century BC. He concentrated on ethics, dismissing logic and physics as irrelevant.

Like many contemporary philosophers, including Zeno, Ariston undoubtedly saw his own views as the ones most authentically capturing those of Socrates. Virtue he considered a unitary intellectual state, its conventional fragmentation into kinds being misleading at best. He resisted Zeno's doctrine that nonmoral desiderata like health, although indifferent, were naturally 'preferable'. Total indifference to them, rather than rationally choosing between them, was the true goal of life. He rejected rules of conduct - much favoured by Zeno - as founded on the same mistake of treating indifferent things as if they could be ranked in terms of intrinsic values.

1 Life and work

Ariston of Chios was, during much of the third century BC, as important a figure in the Stoic school at Athens as Zeno of Citium, its official founder and his own teacher. But very little is known about Ariston's life. Probably he was Zeno's pupil in the early years of the third century, outliving him by a substantial period and perhaps well into the second half of the century.

Ariston's interests were almost entirely ethical, although there is some evidence of an interest in poetics, and possibly even in grammar. He stayed much closer to Cynic ethics (see Cynics) than Zeno himself did, and in the long run it was the differences between the two that were most noticed. The later Stoic tradition chose to revere Zeno but not Ariston, and, because history is written by the winners, Ariston has come to be seen with hindsight as a marginal and heretical figure. This was certainly not so in his own day, when his impact at Athens was enormous. For example, Arcesilaus, who had led the Academy into its sceptical phase (see Academy), appears to have engaged in debate with Ariston at least as much as with Zeno. Ariston's own pupils included a leading Stoic Apollophanes, and the celebrated scientist Eratosthenes. Ariston was an acute observer of contemporary philosophy, and his mock-Homeric line of verse about Arcesilaus as a philosophical chimera ('Plato in front, Pyrrho behind, Diodorus in the middle') became famous (see Arcesilaus §1).

What is harder to know is how far the later tradition may have exaggerated or even invented doctrinal differences between Ariston and Zeno. But there seems little doubt that some of these were real. During Zeno's lifetime, open disagreement with him was apparently acceptable in the school. After Zeno's death (262), however, his thought became canonized: Ariston's independence now began to look like heresy. It was probably at this stage that he set up his own school, said to have been in the Cynosarges gymnasium outside the city walls of Athens.

Ariston is reported to have written a number of works. The titles of fourteen are listed by Diogenes Laertius in a short biography of him. Some later Stoics disputed the authenticity of most of these, attributing them instead to the Peripatetic Ariston of Ceos, with whom Ariston of Chios certainly is sometimes confused in ancient sources. However, there is a good chance that all or most are genuine. They include *Chreiai* (a typically Cynic collection of moral anecdotes), *Dialogues*, *On Zeno's Doctrines*, *Against the Orators* and *Against the Dialecticians*. A further work, *Comparisons*, was a collection of Ariston's graphic philosophical similes (look out for some below).

Ariston objected to Zeno's tripartite philosophical curriculum, consisting of logic, physics and ethics. Echoing Socrates (Plato, *Apology* 19b-c), he dismissed physics as 'above us'. Dialectic, the formal study of argument, and hence a mainstay of the branch called 'logic', Ariston likened to cobwebs (technically complex, but useless), to quicksand, and to eating crabs (lots of bones, little nutriment). He judged these parts of philosophy - as also much of the traditional Greek educational curriculum - an irrelevance to what really mattered in life: moral knowledge. Consistently with this, his own important contributions were in ethics.

2 Indifference

Socrates had argued that most things conventionally judged good or bad, such as health and illness, are in themselves neither, since they only get their value from the way they are used. Health and sickness wisely used are

great goods, while unwisely used they are great evils. The consequence, that only virtue or wisdom is good, only vice or folly bad, while everything else is morally 'indifferent', was widely endorsed in the fourth-century BC Socratic tradition, including Cynicism. Zeno's innovation (see Stoicism §15) was to rank the indifferents on a scale of natural preferability, while continuing to call them indifferent. He also, in consequence, attached enormous importance to rules or 'precepts', as offering indispensable guidelines to a proper choice among the indifferents, and thus a start towards the goal of 'living in accordance with nature'.

Ariston fought a rearguard action against this dilution of Socratic/Cynic values: indifferents really are just that, indifferent. He denied rules any moral value. And in place of Zeno's formulation of the goal, he described it as 'living with a disposition of indifference towards what is intermediate between vice and virtue, not retaining any difference at all within that class of things, but being equally disposed towards them all'. He is said to have formed his view when, during Zeno's illness, he attended the lectures of Zeno's old Platonist teacher Polemo (see Platonism, Early and Middle §1). Paradoxically, Polemo himself was attacking Zeno from the other direction, for refusing to call such items as health and illness 'good' and 'bad'. No doubt Polemo argued for a straight choice: either such items are good and bad, or they cannot be valued relatively to each other at all. While Polemo took the former option, Ariston was persuaded by the latter.

Ariston's fundamental objection to rules of conduct seems to have been as follows. Typical precepts ('Don't get drunk', 'Look after your health', 'Avoid enslavement' and so on) misleadingly attach preferential value to items such as sobriety, health and freedom, which are in themselves totally indifferent and are worthy of choice purely according to circumstances. It was as if in spelling one were to favour some letters as intrinsically preferable to others. Rules of conduct, he concluded, have no place outside the kindergarten.

Ariston's rejection of rules has led some to call him an 'intuitionist'; and he is indeed reported as saying the sage will do 'whatever comes to mind' (Cicero, *On Ends* IV 43). But we also know that, as a Socratic, he held that virtue is an intellectual state - knowledge of good and bad (although also called 'health', that is, of the soul) - and that in place of rules he recommended reliance on 'doctrine'. He therefore must have thought correct moral decisions were arrived at by reasoning, not intuition. The serious problem that confronted him was, rather, how non-moral decisions should be made. If public image, comfort and so on are literally indifferent, how can we make such trivial decisions as which clothes to wear or which food to eat? Yet if we could not choose, we would wear and eat nothing. It was almost certainly to answer this that Ariston's appeal to intuition came in. If the objection was that the Aristonian sage will, like Buridan's ass, starve to death through inability to choose between indifferents, Ariston's answer was that in such situations it is rational simply to do the first thing that comes into your head.

3 Virtue

Since virtue is simply a matter of knowing good and bad, it becomes hard to see how it can have distinct parts, species or branches. In the wake of Socrates (see especially Plato's *Protagoras* and Socrates §5), every Socratic philosopher defended some version of his thesis of the unity of the virtues. To some (for example, Chrysippus: see Stoicism §16) this meant no more than their inseparability, but Ariston was one of those who took them to be literally one and the same thing. Why then do they have different names? His answer was that the very same state of mind was named differently according to the circumstances in which it was located. In situations of danger, for example, knowledge of good and bad was called 'courage'; in situations involving appetite, 'self-discipline' (*sōphrosynē*), and so on. It was, he said, as if one were to vary between calling the power of eyesight 'white-seeing' and 'black-seeing', according to the objects it happened to be confronted with. Chrysippus devoted a treatise to refuting Ariston on this issue.

The clear implication is that the different species names of virtue are superficial and accidental, misleadingly fragmenting what is in reality a unitary intellectual power. This disdain for conventional distinctions was characteristic of Ariston, and did much to give his pronouncements their strongly Cynic flavour. Consider his striking assertion of cosmopolitanism: 'A native land does not exist by nature, any more than does a house, a field, a smithy or a doctor's surgery. Each one of these comes to be so, or rather is so named and called, always in relation to the occupant and user.'

Aristotelianism in Islamic philosophy

In Arabic, Aristotle was referred to by name as Aristutalis or, more frequently, Aristu, although when quoted he was often referred to by a sobriquet such as 'the wise man'. Aristotle was also generally known as the First Teacher. Following the initial reception of Hellenistic texts into Islamic thought in al-Kindi's time, al-Farabi rediscovered a 'purer' version in the tenth century. In an allusion to his dependence on Aristotle, al-Farabi was called the Second Teacher. Ibn Rushd, known in the West as Averroes, was the last great Arabophone commentator on Aristotle, writing numerous treatises on his works. A careful examination of the Aristotelian works received by the Arabs indicates they were generally aware of the true Aristotle. Later, transmission of these works to Christian Europe allowed Aristotelianism to flourish in the scholastic period.

We should not take at face value the Islamic philosophers' claims that they were simply following Aristotle. The convention in Islamic philosophy is to state that one is repeating the wisdom of the past, thus covering over such originality as may exist. There was a tendency among Islamic philosophers to cite Aristotle as an authority in order to validate their own claims and ideas.

1 Early influence

Among the major differences between the Islamic philosophers and Aristotle are the questions of the eternity or creation of the world, the nature of Being and a real-world distinction between essence and existence. The ninth-century philosopher al-Kindi used Aristotle, in Arabic translations, as a base for his own philosophical works. Among other works, al-Kindi wrote one treatise specifically dealing with Aristotle, *Fi kammiya kutub Aristutalis wa ma yahtaj ilahi fi tahsil al-falsafa (The Quantity of the Books of Aristotle and What is Required for the Acquisition of Philosophy)*. The early part of this treatise gives an accurate summary of various logical works by Aristotle, such as *Categories* and *De Interpretatione*, before diverging into a decidedly non-Aristotelian précis on questions found in the physical treatises. Though he owed a large debt to Aristotelian thought, al-Kindi parted company with Aristotle in espousing the idea of creation from nothing by a Creator. Furthermore, in writing about creation al-Kindi does not ascribe the idea to Aristotle in the text of his treatises. Debate still continues over whether al-Kindi should be considered more 'Platonic' or 'Aristotelian'.

An inventory of those works attributed to Aristotle which were available to early Islamic philosophers appears in the *Fihrist* of the tenth-century bibliographer Ibn al-Nadim. The work known as the *Theology of Aristotle* appears in the *Fihrist*, although it is mentioned only in passing. Greater attention is paid to other correctly attributed works of philosophy and logic by Aristotle, including such detailed information as the translator, the number of sections and the work's Arabic commentators, suggesting the relative importance of these works to Ibn al-Nadim and his audience. Judging from the list available in the *Fihrist*, the Islamic philosophers would have been able to appreciate Aristotle's logic, physics and metaphysics. However, since the *Theology of Aristotle* was really a Neoplatonic work (see Neoplatonism in Islamic philosophy §1), based on the *Enneads* of Plotinus, accepting this attribution would have obscured understanding of Aristotle. Whatever the influence of Aristotle on Islamic philosophy, the Muslims were nonetheless obliged to work out for themselves certain underlying issues, such as conceptualizing ideas in their own language. In particular, they had to implement a philosophical terminology, as there was a lack of abstract nouns in Arabic.

2 Middle stage: Ibn Sina and al-Farabi

The Islamic philosophers picked and chose from Aristotle's texts, using him as an authority when it suited their purposes, and knowing that philosophy was a 'foreign science' in need of an external authority as it lacked an indigenous authority. While aspects of Avicennan philosophy continue the Aristotelian tradition in broad terms, Ibn Sina's ideas about the Necessary Existent and the Possible Existent do not have their antecedents in Aristotle's philosophy (see Ibn Sina). However, as Ibn Sina himself hailed from Khurasan, one cannot dismiss the possible influences of Buddhism, Zoroastrianism and Hinduism on his philosophy. The differences with Aristotle go back to the fact that the philosophers are writing in an Islamic milieu, and certain changes had to take place to correlate with the religious ideology. Seen in some lights, these changes may be considered peripheral; the philosophers continued to hold a solidly Aristotelian view of such basic ideas as the relationship of form and matter.

Among the scholars of the Middle Period - the fourth and fifth centuries AH (tenth and eleventh centuries AD) - al-Farabi is considered the foremost Aristotelian, and was indeed known as the Second Teacher (Aristotle himself being the First Teacher). Some scholars have divided his works into those which admit Aristotelian influence, such as *Kitab al-huruf (The Book of Letters)*, and more popular works, such as *Kitab fi mabadi' ara' ahl al-madina al-fadila (The Book of the Principles of the Opinions of the People of the Virtuous City)*, usually known simply as *al-Madina al-fadila (The Virtuous City)*, a utopian treatise which espouses Neoplatonic theories such as emanation, in which everything is said to flow from the One. His internalization of Aristotle is apparent in his treatment of the four causes in *Tahsil al-sa'ada (The Attainment of Happiness)*, echoing those found in *al-Tabi'a (The Physics)*. Here he shows a complete familiarity with the Aristotelian idea of the four causes, but is equally willing to propound his own interpretation, preferring the word *mabadi'* (literally, principles) rather than *asbab* (causes), which was the translator Ibn Ishaq's choice.

On another important point, however, al-Farabi is not conceptually Aristotelian. In *al-Madina al-fadila*, we do not find the long discourses on the inherent weakness of women, children and slaves, which are found in Aristotle; rather, he distinguishes the inhabitants of the virtuous city from those of the ignorant cities by their moral character.

Al-Farabi considered his *Kitab al-huruf*, which takes its title from the Greek letters which entitle Aristotle's chapters, to be a commentary on Aristotle's *Metaphysics*. While *al-Huruf* is inspired by Aristotle's concerns, and deals with many of the same subjects, it does not slavishly imitate or even follow the order of the *Metaphysics*. Al-Farabi also believed in the ultimate harmony of the opinions of Plato and Aristotle, a difficult notion for many philosophers today to accept.

One might ask why Ibn Sina (Avicenna) would be taken in by a false treatise, the *Theology of Aristotle*, when he had such a good command of Aristotelian concepts that he could quote accurately from memory. In his 'Letter to Kiya', Ibn Sina expresses doubt about the authorship of the *Theology of Aristotle*, remarking that the text is 'somewhat suspect' (Gutas 1988). The tone of his discussion indicates that while he included this work with other Aristotelian treatises, he has by no means concluded it is genuinely an Aristotelian text. On the other hand, in the *Danashnama-i 'ala'i (The Book of Knowledge for 'Ala')*, his account of metaphysics, Ibn Sina derives a quotation from Aristotle where he claims that Aristotle describes the First Being as having complete happiness in itself. It is uncertain to which part of the *Metaphysics* Ibn Sina is referring, as such a passage does not appear to exist.

Elsewhere, Ibn Sina claims to quote Aristotle from memory when discussing the theory of definition for his treatise on Definitions, when he suggests that in the *Topics*, Aristotle defines definition as 'a statement indicating the quiddity of a thing'. This is an exact quotation. It is remarkable that Ibn Sina appears to remember Aristotle's important ideas word for word after having, he says, read the books only once and thereafter being unable to refer to them. Given his life as a wanderer, this statement is credible.

3 Late period: the legacy of Aristotelianism

Unlike the Islamic east, where a Hellenistic tradition of philosophy flourished from the ninth century, philosophy reached al-Andalus later. Ibn Bajja, known as Avempace in Latin, was one of its first practitioners, active in the early part of the twelfth century. His heavily Aristotelian commentaries on the logical works of al-Farabi still survive. The socio-historian Ibn Khaldun ranked him with Ibn Rushd, and Ibn Bajja no doubt influenced this, the most famous, philosopher of Muslim Spain.

Ibn Rushd, better known in the West as Averroes, is considered not nearly as influential in the Islamic world as he was in medieval Europe. Here, either because he lived on the Western periphery of the Islamic world or because he wrote such extensive commentaries on Aristotle, he became renowned (see Averroism §1). Latin translations of Ibn Rushd's texts were available in Europe within a century of his death. Coming from a family of eminent jurists, Ibn Rushd had legal as well as philosophical training. He wrote commentaries on a wide range of Aristotle's works, including his *Physics*, *Metaphysics*, *Book of the Soul*, *On the Heavens* and *Posterior Analytics*, the last dating from 1170. In both long and intermediate commentaries as well as short paraphrases, Ibn Rushd tried to analyse the extent of his Islamic predecessors' deviation from Aristotle. He also exerted himself in reconciling religion and philosophy in his *Fasl al-maqal (Decisive Treatise On the Harmony of Religion and Philosophy)*. He discovers a duty to reflect with the intellect on existing beings and to seek knowledge in the Qur'anic injunction

found at Surah 49: 2: 'Consider, you who have vision.'

There is good reason to consider another of Ibn Rushd's works, the *Tahafut al-tahafut (The Incoherence of the Incoherence)* to be an attack on Neoplatonism and a defence of true Aristotelianism. On the question of the origin of the world, Ibn Rushd promulgated eternal creation but did not accept emanation. While he wrote the *Tahafut* primarily as a rebuttal of al-Ghazali's attack on the philosophers, he also disagreed with Ibn Sina's ideas about necessity.

Ibn Rushd was also to be the last in the line of Islamic Aristotelians. Throughout the classical period of Islamic thought, there were always some thinkers who distrusted rationalism and logic, certain that the study of philosophy results in a loss of faith. Al-Ghazali and Ibn Taymiyya are the two best known examples. Al-Ghazali studied philosophy to be able to rebut it; he suggested that knowledge is inferior to faith, as knowledge could not overcome doubts. His *Tahafut al-falasifa (The Incoherence of the Philosophers)* had a lasting influence. Here al-Ghazali attacked Aristotle and his followers, al-Farabi and Ibn Sina, particularly objecting to the Aristotelian notion of the eternity of the world, which he found irreconcilable with the Qur'anic description of God's creation of the world from nothing. Al-Ghazali also saw this as an idea which limited God in a totally unacceptable manner. Two centuries later, Ibn Taymiyya wrote *al-Radd 'ala al-mantiqiyyin (Against the Logicians)* as an attack on the method of definition and demonstration used by the philosophers who were influenced by Aristotle. He argued that logic is based on the faculty of human reason, which is necessarily inferior to divine revelation.

Despite the efforts of Ibn Rushd to rehabilitate philosophy, many scholars believe that Islamic philosophy never completely recovered from al-Ghazali's massive and brutal assault on it. In the Latin West, Islamic Aristotelianism was reincarnated as Averroism, that is, Aristotle's works as taught by Ibn Rushd and translated into Latin (see Aristotelianism, medieval §4; Averroism §1). His works also came to have great influence in Jewish philosophy, and for many years led to a strong strain of Aristotelianism among Jewish philosophers (see Averroism, Jewish). Aristotelianism continued to have an effect on Islamic philosophy through opposition to it from Illuminationist philosophy (see Illuminationist philosophy), and in particular thinkers such as al-Suhrawardi, al-Shahrazuri, Ibn Kammuna and others, often based in Persia. The latter sought to attack what they took to be the principles of Aristotelianism, especially its logical and ontological axioms, and produced critiques of Aristotelian essentialism which are sometimes quite similar to that of William of Ockham. It is accurate to say, however, that Aristotelianism as a school of philosophy in the Islamic world found no Muslim successors after the death of Ibn Rushd.

Aristotelianism in the 17th century

Aristotelians in the seventeenth century comprised a group of mostly anonymous textbook writers whose chief claim to fame is that their philosophy was opposed by such as Descartes and Galileo. In line with the characterization of them by their opponents, their philosophy has generally been depicted as extremely conservative, monolithic and moribund. However, it is difficult to ratify such judgments. As Aristotelians, these philosophers do not seem particularly conservative; they appear to have assimilated many of the scientific developments of the seventeenth century, and the diversity and range of their views is quite broad. Some of the doctrines peculiar to them, or their particular developments of older views, can be seen as the background against which modern philosophy developed.

1 Some notable doctrines

What was taught in the schools during the seventeenth century was Aristotelian, but remains difficult to describe: probably not one of Aristotle's doctrines was held by all early modern scholastics. Some central Aristotelian theses were discarded. For example, Théophraste Bouju, in a work whose title page announces that all of it has the authority of Aristotle, rejected the Aristotelian four elements, discarding the sphere of fire and, as a consequence, argued against the radical heterogeneity of the sub-lunary and supra-lunary spheres (Bouju 1614). However, he safeguarded the *de facto* immutability of the heavens. Many of the theses that became canonical with later Aristotelians, such as the doctrine of substantial forms, also found early modern critics (Maignan 1653; Fabri 1686); there were even textbook writers who proclaimed the compatibility of peripatetic philosophy and atomism (Sennert 1618; Casimir of Toulouse 1674). Thus, it would be difficult to justify the epithet 'monolithic', although such pejorative labels have been applied to late scholasticism from the beginning. René Descartes wrote in a letter to Mersenne dated 11 November 1640 that there is nothing that seems as improbable to him than the philosophy of the schools: he does not think it difficult to refute, 'for one can easily upset all the foundations to which they agree and, once this is achieved, their particular disputes would appear inept'.

In fact, many Aristotelians of the seventeenth century were forward-looking, accepting the latest scientific developments including Galileo's celestial observations (Crassot 1618; du Chevreul 1623; du Moulin 1644, and others). Their philosophy of science can be characterized as probabilistic (Eustachius 1609 III.1: 1-3; and others), and some of their doctrines provide a background against which modern philosophy developed (see §§2, 5 of this entry). With the exception of the most noted (including Francisco Suárez and, possibly, Eustachius a Sancto Paulo, studied at least for his significance for Descartes) these thinkers are now generally neglected. In the Protestant world, such scholastic writers as Franco Burgersdijk at Leiden and Bartholomaeus Keckermann at Heidelberg were widely read, gaining fame primarily as logicians. In England, philosophers such as Thomas White and Kenelm Digby demonstrated flexibility in their attempts to graft the new philosophy on to Aristotelian roots.

2 Textbooks and notions of order

Eustachius a Sancto Paulo studied at the Sorbonne, receiving his doctorate in 1604. The following year he entered the Cistercian congregation of the Feuillants where he held various prominent positions, and became very influential in the French Catholic revival. He wrote two popular textbooks, a *Philosophy* (1609) and a *Theology* (1613-16), as well as two manuals of spiritual exercises.

Eustachius' *Philosophy* was considered by Descartes to be the best textbook in philosophy - Descartes even considered publishing it, together with his notes, other opinions, and his own philosophy. To understand the genre and its popularity, it must be contrasted with other such texts. Among the widely-read authors at the end of the sixteenth and the beginning of the seventeenth century were the Coimbrans and Franciscus Toletus. The Coimbrans (the Conimbricenses) were professors at the Jesuit Colègio das Artes, Coimbra (Portugal), who published a series of encyclopedic commentaries on Aristotle's works (see Collegium Conimbricense). The principal Coimbran was Petrus Fonseca, who separately published his own commentary on Aristotle's *Metaphysics*. Franciscus Toletus, a professor at the Jesuit Collegio Romano, similarly published commentaries on Aristotle's works, including an important *Logic* (1572), *Physics* (1573) and *On the Soul* (1574). (Other noted Jesuits who published textbooks for the collegiate curriculum included Rodericus Arriaga, Christopher Clavius and Antonius Rubius). In France, non-Jesuit philosophy texts from the same period included those by doctors

associated with the University of Paris, such as Eustachius and Charles d'Abra de Raconis (whose *Philosophy* was published in 1617), Jean Crassot (1618), Jean-Cécile Frey (1633) and François Le Rées. Judging from the number of editions, the texts of Eustachius and de Raconis were the most widely read Latin-language philosophies of the first half of the seventeenth century, Eustachius' *Philosophy* taking first place.

The seventeenth century also saw an enormous growth of philosophy textbooks in French, written by the tutors of the nobility (themselves often nobles). The movement began in the 1560s with the first French translations of Aristotle's works, but took off in the 1590s with the first French-language commentaries on Aristotle's *Physics*. Works in this genre include the 1614 textbook by Henry IV's almoner, Théophraste Bouju, and the 1643 volume by René de Ceriziers, a Jesuit who became a secular almoner of the Duc d'Orléans and later counsellor to the King. The most frequently reprinted work in the genre was the *Philosophy* (1627) by Scipion Dupleix, Cardinal Richelieu's favourite historian. This work alone seems to have exceeded Eustachius' in popularity.

The proliferation of textbooks in philosophy was a response to important changes taking place in pedagogy. The Jesuits, following the example of the University of Paris, had reorganized and standardized their curriculum. Textbooks, both Jesuit and non-Jesuit, were consequently modified. For example, the Coimbrans wrote volumes by committee, presenting the works of Aristotle that were taught in the curriculum; they followed the model of the great medieval commentaries, each volume treating a specific text (*Physics*, *On the Soul*, *On the Heavens* and so on), but with an elaborate (post-Renaissance) scholarly apparatus, giving both Aristotle's Greek text and its Latin translation, as well as Latin paraphrases (*explanationes*) and *quaestiones*, the analysis of standard problems relevant to the text being discussed. This pattern was generally followed by other textbook writers, although later editions of the Coimbran commentaries and textbooks such as those of Toletus omitted the Greek versions of Aristotle. Ultimately, Eustachius' *Philosophy* even omitted Aristotle's text itself. Eustachius simply arranged the *quaestiones* in the order in which the curriculum would have presented them, doing so for all the Aristotelian sciences within the frame of the whole philosophy curriculum - ethics and logic, physics and metaphysics - in a single volume. Dupleix followed the same pattern, as did de Raconis who also gave paraphrases along with the *quaestiones*. As their names generally indicated, the latter works were usually divided into four parts, following the collegiate curriculum. However, the *Philosophy* (1644) by the Protestant, Pierre du Moulin (whose logic text was also translated into English), was a three-part textbook (metaphysics having been omitted), and the *Philosophy* (1642) of Léonard Marandé added theology as a fifth part.

Underlying the format of these textbooks was a Renaissance concern with order or method. In one of the preliminary questions on the *Physics* Eustachius asked whether there is an order in the different parts of philosophy. He affirmed that there is one, appropriate both for the nature of things and for doctrine: namely, that which goes from the simplest to the more complex, from the principles to that of which they are constituted, and at the same time proceeding from the most universal things to the less universal, to the genera and species. Eustachius also asserted that Aristotle used such an 'order or method' in his writings on the various parts of philosophy. According to Eustachius, Aristotle in the *Physics* began with the principles, causes and general properties of natural things, then proceeded 'in part according to an analytic order and in part according to a synthetic order', from the most universal principles to the particular species of natural bodies. Eustachius consequently ordered his own presentation of natural philosophy into three parts: (1) natural bodies in general, from the principles of natural things to their causes and common properties, from matter and form, to causes, to place, infinity, void, time and motion; (2) inanimate natural bodies, from the world to the heavens and from elements to heterogeneous bodies; and (3) animate natural bodies, from soul in general to vegetative, sensible and rational soul. In fact, Eustachius reorganized Aristotle's topics and even reordered the *Physics* itself in keeping with his notion of order.

A general characterization of the doctrines of the first half of the seventeenth century is that the Jesuit textbooks (Coimbrans and Toletus, for example) usually propounded Thomist interpretations of Aristotle, while those associated with the University of Paris (Eustachius and de Raconis) did not, often preferring Scotist doctrines (see Aquinas; Duns Scotus, J.). The French-language authors varied in outlook: Bouju was a Thomist in many respects; Dupleix was vociferously anti-Thomist, resembling greatly the non-Jesuit Paris philosophers; and de Ceriziers seems to have supported a later, hybrid version of Thomism, answering many of the charges levelled against Thomism. By 1665 even the Jesuits, as evidenced by Pierre Galtruche's textbook (a work approved by the Order), seem to have rejected the Thomist positions in philosophy. However, the debate about Thomism and Scotism

continued into the seventeenth century. (To illustrate these generalizations, §§3 and 4 of this entry offer two examples from the foundations of natural philosophy.)

3 Matter and form

There was a debate in school texts about whether matter can exist without form. A positive resolution of this esoteric topic might lead one towards a dualistic, as opposed to a hylomorphic, conception of substance. Toletus (1589 I.13) discussed whether prime matter is a substance and detailed Aquinas' negative answer. According to Aquinas, prime matter is pure potency or has only potential being, so prime matter cannot be brought into being without form and cannot subsist without form. Toletus also explained Scotus' affirmative reply, that matter is a positive entity really different from the reality of form and can subsist in its own right distinct from form. Toletus shared Aquinas' view, his own doctrine being that prime matter is imperfect in itself (Toletus 1589 I.13: fol. 34 *verso*). Bouju also followed the Thomist line (Bouju 1614 I: 315-31). In contrast, Eustachius supported a variant of Scotus' doctrine: 'Though matter cannot be produced nor annihilated by any natural agent, God can create or annihilate it… God can strip naked all forms, substantial and accidental, from matter, or create it naked, without form, *ex nihilo*, and allow it to subsist by its own power in such a state' (1609 III.1.2.4: 16-17). Abra de Raconis agreed; quoting both Aquinas and Scotus, he said that matter is an incomplete substance, but maintained that God can create matter without substantial form ([1617] 1651 *Tractatus de Principiis* 4: 35-9). Scipion Dupleix threw into relief the disagreement between Thomists and Scotists:

> Thus matter deserves the name of substance because it subsists by itself and is not in any subject. This reply is based on the Philosopher's doctrine, but it does not satisfy everyone, particularly Saint Thomas Aquinas and his followers, who hold that such matter is not in nature, and cannot be in it, and even that this is so repugnant to nature that God himself cannot make it subsist thus stripped of all form. But this opinion is too bold, too mistaken, and it has been rejected by Scotus the Subtle [Doctor] and by several others.
>
> (Dupleix [1603] 1990: 131)

It is interesting to note that Dupleix argued against Aquinas' doctrine of prime matter by analogy to the sacrament of the Eucharist requiring real qualities and substantial forms, a difficulty that would haunt Cartesians and atomists later in the century. Some textbook writers got around the accusation by accepting the reality of matter as a miracle - for example, de Ceriziers argued that there can be no form without matter and no matter without form naturally, but added 'however, one must not deny that God can conserve matter without any form, since these are two beings that can be distinguished, that no more depend upon one another than accident from substance, the former being separated from the latter in the Eucharist' (1643 III: 51-2). The solution seems to have been unstable, so that by 1665 (II: 27) Gaultruche argued against the Thomists (*contra Thomistas*) about prime matter.

Not everyone gave up the Thomist doctrine of matter. Although Scotists such as Frassen seem to have had the best of the argument, and Thomists and Jesuits such as Barbay and Vincent needed to opt for middle ground, some Thomists resolutely maintained their position (Frassen 1686: 36-41; Barbay 1676b: 64-72; Vincent 1660: 2.74-7). For example, the Dominican Antoine Goudin wrote:

> it can be asked whether God by means of his omnipotence could create matter without it having a form. Scotus asserts it, as do some authors outside of Saint Thomas' school; Saint Thomas and all the Thomists deny it…. It seems that matter cannot exist without form even by means of God's absolute power. That is what Saint Thomas states (III quodlib. art 1). God himself cannot make it that something exist and not exist. He cannot make something that implies a contradiction and, consequently, he cannot make matter be without form.
>
> (Goudin [1668] 1864 II: 131)

4 The concept of place

Seventeenth-century school philosophy debated whether place itself is mobile or not - which is to say, whether there is a fixed reference for motion. Thomists distinguished between material place and formal place (where formal place is the real ground or *ratio* of place, in Aquinas' vocabulary). Place is then movable accidentally (as material place) and immovable *per se* (as formal place, defined as the place of a body with respect to the universe as a whole). Thus a ship is formally immobile with respect to the universe as a whole when the waters flow around it. Scotists rejected the distinction between material and formal place, arguing instead that place is a relation of the

containing body with respect to the contained body. Place is then a relative attribute of these bodies. (They also made use of the term *ubi*, sometimes referred to as inner place, to denote the symmetric relation of the contained body with respect to the containing body.) Since the relation changes with any change of either the contained body or the containing body, the place of a body does not remain the same when the matter around changes, even though the body in question might remain immobile. When a body is in a variable medium, the body is in one place at an instant and in another at an other instant; to capture what is meant by the immobility of place, Scotists said that the two places are distinct but *equivalent places* from the view of local motion.

Toletus took Aquinas' side against Scotus (Toletus 1589 IV.5: fol. 120 recto-121 recto). So did Bouju who also kept some Averroist elements. Bouju asserted that place is movable *per se* in what he called 'lieu de situation' and *per accidens* in what he called 'lieu environnant':

> The earth… is in a *lieu environnant* and can also be said to be in a *lieu de situation* with respect to the poles of the world. But it cannot change place with respect to its totality; thus it is immobile in that respect and mobile only with respect to some parts that can be separated from the totality and moved into others. The firmament is also in a *lieu de situation* with respect to the earth, but it cannot change except with respect to its parts and not in its totality, in the fashion of the earth.
>
> (Bouju 1614 I: 458-9; see also I: 460)

Eustachius, on the other hand, used Scotus' vocabulary: place and *ubi* being relations between the containing and contained bodies, and places being the same *by equivalence* (Eustachius 1609 III.3.2.1: 56-8). Abra de Raconis held a similar doctrine. De Raconis discussed two kinds of place, external and internal, external being the surface of the concave ambient body, and internal being the space occupied by the body. According to de Raconis, the ultimate heaven is in place internally, or occupies a space of three dimensions (Raconis [1617] 1651 *Physics* IV.2.1-2: 204-5). The distinction between external and internal place (or space) can also be found in Toletus and the Coimbrans; but they did not use the distinction in their resolution of issue of the mobility of place.

As was often the case, it was Scipion Dupleix who put the greatest contrast on the situation. He held that place was immobile in itself, while bodies change places. He took it that Aquinas had a different opinion, interpreting Aquinas' doctrine of formal place as the view that one can imagine a distance from each place to certain parts of the world with respect to which a given place, though changeable, may be said to be immobile. Scipion raged against the doctrine: 'But since all this consists only in useless imaginations, I am surprised that this opinion was received in several schools of philosophy; however, there are so many weak though opinionated brains who follow so closely the doctrine of certain persons that they would follow them right or wrong, and forget the golden sentence of the Philosopher: *I am a friend of Socrates, a friend of Plato, but rather more a friend of truth*' (Dupleix [1603] 1990: 149-50). On the subject of the place of the universe, Dupleix also rejected Aquinas' opinion, preferring a doctrine he attributed to Philoponus and Averroes, that when air is blowing around a house, one says that the place of the house changes accidentally. The house is in the same place *by equivalence* (that is, of the successive, distinct accidental places). Finally even Gaultruche rejected the Thomist doctrine of place, including the Thomist doctrine that the universe cannot move as a whole (Gaultruche 1655 II: 331). As with matter and form, the debate about the concept of place was not completely settled by the second half of the seventeenth century, overlapping similar disputes among the new philosophers (Frassen 1686: 357; Barbay 1676b: 261-72; Vincent 1660 II: 847-925; Goudin [1668] 1864 II: 504-6).

5 The origins of the modern concept of *idea*

Not all early modern scholastic debates took the form of Thomism versus Scotism. Some developments might have been equally at home in either camp. An interesting case, in view of the later philosophy of history, is a development of the Platonic and Neoplatonic theory of ideas within an Aristotelian context in the first few decades of the seventeenth century (see Neoplatonism). The discussion of ideas in Bouju's *Philosophy* is fairly standard. Enumerating the four Aristotelian causes, Bouju adds an account of 'exemplary causation'. Ideas are routinely identified with exemplars, either Platonic ideas or ideas in God's mind, and the question discussed is, whether in serving as models for creation, ideas as exemplars *cause* the things that imitate them in some fifth way. Further, the physician has an idea of health, the architect in building a house tries to make it like the one 'he has in his mind', and so on. Bouju is echoing a well-established Scholastic-Aristotelian tradition, in which ideas are either

the forms in God's mind according to which he makes things, or the exemplars in artificers' minds when they make their artefacts. Ideas as exemplars, however, are not strictly psychological. They are forms which are general, not particular, patterns to be followed in this or that case, rather than particular mental events (Bouju 1614 I: 297-8).

Possibly the first instance of a new, psychological usage of 'idea' in the philosophical literature seems to occur in the first part of the *Physics* of Eustachius. Again the question is whether exemplary causes constitute a fifth class in addition to the canonical four. Eustachius' answer is that in the case of natural causation exemplary cause may be taken to be a kind of efficient cause, but in the case of an artificer it is, rather, the formal cause:

> What the Greeks call Idea the Latins call Exemplar, which is nothing else but the explicit [*expressa*] image or species of the thing to be made in the mind of the artificer. Thus the idea or exemplar is in this case some image [*phantasma*] or work of imagination [*phantasiae*] in the artificer to which the external work conforms. And so in the artificer in so far as he is an artificer there are two internal principles of operation, namely the art in his mind or reason and the idea or exemplar in his imagination [*phantasia*]. Art is a certain disposition, but idea is a certain act or concept represented by the mind. So, the mind first represents a copy of the thing to be made through art, then it contemplates what it has represented, and directs the external work to its likeness.
>
> (Eustachius 1609 III.1.3: 36.)

Here the idea is an image and (particularly crucial for the Cartesian reading) it is 'an act' or 'concept expressed by the mind'. In this brief passage, then, we have the contemporary meaning that Descartes will exploit; idea is, as it were, an image, expressive of something, something which the mind contemplates. It is both something I do as well as something I 'see'.

One finds a similar account in Abra de Raconis ([1617] 1651: 94). Clearly, Descartes would not have to look far to find the term 'idea' used with the kind of ambiguity that he assigned to it in the Meditations.

6 Late seventeenth-century scholastics

By the end of the seventeenth century, Cartesianism and other versions of the new philosophy began to take hold and scholastics ranked themselves pro and con - mostly con. Many of them wrote critiques of Descartes (Huet 1689; La Grange 1692; Jean Duhamel 1692) or inserted critiques of Descartes into their textbooks (Frassen 1686; Barbay 1675-6; Vincent 1660, 1667; Goudin 1668; Jean Duhamel 1705); some even wrote satire of Cartesianism (Huet 1692; Daniel 1690, 1693) (see Huet, P.D.). And some attempted reconciliations between what they took to be Aristotelianism and Cartesianism (Jean-Baptiste Duhamel 1677; Le Bossu 1674). A few became Cartesians (Pourchot 1695). In England, Edward Stillingfleet and the 'Blackloist' John Sergeant were important critics of John Locke from an Aristotelian point of view.

ROGER ARIEW

List of works

Arriaga, R. (1632) *Cursus philosophicus (Philosophy course)*.(A complete philosophy course by a Jesuit professor.)

Barbay, P. (1675) *Commentarius in Aristotelis logicam (Commentary on Aristotle's Logic)*, Paris.(The first portion of the philosophy course by a professor at the University of Paris. Barbay's texts were recommended by both Jesuits and Oratorians.)

Barbay, P. (1675b) *Commentarius in Aristotelis metaphysicam (Commentary on Aristotle's Metaphysics)*, Paris. (The third portion of Barbay's course.)

Barbay, P. (1676) *Commentarius in Aristotelis moralem (Commentary on Aristotle's Ethics)*, Paris.(The fourth portion of Barbay's course.)

Barbay, P. (1676b) *Commentarius in Aristotelis physicam (Commentary on Aristotle's Physics)*, 2nd edn, Paris. (The second portion of Barbay's course.)

Bossu, R. le (1674) *Parallele des principes de la physique d'Aristote, et de celle de René Des Cartes (Parallel between the Principles of Physics of Aristotle and Descartes)*, Paris.(An attempt to reconcile the philosophies of Aristotle and Descartes.)

Bouju, T. (1614) *Corps de toute la Philosophie (The whole of philosophy)*, Paris.(An early French-language

complete philosophy course.)
Casimir de Toulouse (1674) *Atomi peripateticae, sive tum veterum tum recentiorum atomistarum placita ad neotericae scholae methodum redacta, (Peripatetic atomism…)*, Toulouse.(An attempt to reconcile atomism and Aristotelianism.)
Ceriziers, R. de (1643) *Le philosophe français (The French philosopher)*, Paris.(A complete French-language philosophy course by a Jesuit.)
Chevreul, J. du (1623) *Sphaera (The Sphere)*, Paris.(A standard mathematics textbook teaching the rudiments of scholastic astronomy but taking Galileo's observations into account.)
Clavius, C. (1611-12) *Opera mathematica (Mathematical works)*, Rome.(The mathematical texts of the Collegio Romano Jesuit professor most responsible for the training of Jesuits who went on to teach in the colleges of the order.)
Conimbricenses (Jesuits of the University of Coimbra) (1592) *Commentarii in octo libros physicorum Aristotelis (Commentaries on the eight books of Aristotle's Physics)*, Coimbra.(The commentary of the Jesuits of the University of Coimbra dealing with bodies, motion, and their metaphysical foundations, that is, the beginning of the physics course.)
Conimbricenses (Jesuits of the University of Coimbra) (1598) *Commentarii in tres libros de anima (Commentaries on the three books on the soul)*, Coimbra.(The commentary of the Jesuits of the University of Coimbra dealing with animate creatures, usually the end of the physics course.)
Conimbricenses (Jesuits of the University of Coimbra) (1606) *Commentarii in universam dialecticam Aristotelis (Commentaries on the whole of Aristotle's logic)*, Coimbra.(The logic textbook of the Jesuits of the University of Coimbra.)
Crassot, J. (1618) *Physica (Physics)*, Paris.(A physics textbook from a professor at the University of Paris.)
Daniel, G. (1690) *Voyage du monde de Descartes*, Paris; trans. as *A Voyage to the World of Cartesius*, London, 1692.(A satire of Cartesian philosophy by a Jesuit.)
Daniel, G. (1693) *Nouvelles difficultés proposées par un péripatéticien à l'auteur du 'Voyage du monde de Descartes' (New difficulties proposed by a peripatetic to the author of 'Voyage to the World of Descartes')*, Paris. (The continuation of Daniel's satire of Cartesian philosophy.)
Duhamel, J. (1692) *Reflexions critiques sur le système cartesien de la philosophie de mr. Régis (Critical reflections on the Cartesian system of philosophy of Mr Régis)*, Paris.(A critical examination of the Cartesian textbook of Pierre-Sylvain Régis by a professor at the University of Paris.)
Duhamel, J. (1705) *Philosophia universalis sive commentarius in universam Aristotelis philosophiam ad usum scholarum comparatam (The whole of philosophy…)*, Paris.(The philosophy course of Duhamel, a professor at the University of Paris, containing many critical references to Descartes' philosophy, including a listing of condemnations by various authorities.)
Duhamel, J.-B. (1677) *Philosophia vetus et nova (Philosophy old and new)*.(An attempt to reconcile old (mostly Aristotelian) and new (mostly Cartesian and Gassendist) philosophies.)
Dupleix, S. (1603a) *La logique ou art de discourir et raisonner (Logic…)*, Paris: Fayard, 1984.(The first portion of Dupleix's course.)
Dupleix, S. (1603b) *La physique (Physics)*, Paris: Fayard, 1990.(The second portion of Dupleix's course.)
Dupleix, S. (1610a) *La métaphysique (Metaphysics)*, Paris: Fayard, 1992.(The third portion of Dupleix's course.)
Dupleix, S. (1610b) *L'ethique ou philosophie morale (Ethics)*, Paris: Fayard, 1994.(The fourth portion of Dupleix's course.)
Dupleix, S. (1627) *Corps de philosophie (Collection of philosophy)*, Geneva.(A popular complete French-language philosophy course, including the separately published *Logic*, *Physics*, *Metaphysics* and *Ethics*.)
Eustachius a Sancto Paulo (Asseline) (1609) *Summa philosophica quadripartita de rebus dialecticis, moralibus, physicis, et metaphysicis (Sum of philosophy in four parts…)*, Paris.(A popular Latin-language complete philosophy course, which Descartes wanted to publish together with his philosophy to enable readers to contrast the two.)
Fabri, H. (1666) *De plantis et de generatione animalium, de homine (On plants and on the generation of animals, on man)*, Lyons.(A physics text by a late seventeenth-century French Jesuit with atomist tendencies.)
Frassen, C. (1686) *Philosophia Academica (Academic philosophy)*, 3rd edn.(A philosophy textbook that defends Scotist school doctrines.)
Frey, J.-C. (1628) *Cribrum philosophorum qui Aristotelem superiore & hac aetate oppugnarunt (The sieve of the philosophers…)*, Paris.(An attack on anti-Aristotelians by a professor at the University of Paris.)
Frey, J.-C. (1633) *Universae philosophiae compendium (Compendium of the whole of philosophy)*, Paris.(The philosophy course by Frey, professor at the University of Paris.)

Gaultruche, P. (1665) *Philosophiae ac mathematicae totius clara, brevis, et accurata institutio (Instruction on all of philosophy and mathematics…)*, Caen, 5 vols.(The philosophy and mathematics courses by a Jesuit professor at Clermont, the main Jesuit college in Paris.)

Goclenius, R. (1613) *Lexicon Philosophicum (Philosophical dictionary)*, Frankfurt.(A comprehensive dictionary of late scholastic philosophical terms.)

Goudin, A. (1668) *Philosophie suivant les principes de Saint Thomas (Philosophy following the Principles of Saint Thomas)*, trans. T. Bourard, Paris, 1864.(A philosophy textbook that defends Thomist school doctrines.)

Grange, J.-B. de la (1682) *Les principes de la philosophie contre les nouveaux philosophes, Descartes, Rohault, Regius, Gassendi, le P. Maignan, etc. (The principles of philosophy against the new philosophers…)*.(A critique of Cartesian and other new philosophies by an Oratorian.)

Huet, P.D. (1689) *Censura philosophiae cartesianae (Judgment on Cartesian philosophy)*, Paris.(A critique of Cartesian philosophies by Huet, who was a Cartesian in his youth.)

[M.G. de L'A.] (1692) *Nouveaux mémoires pour servir à l'histoire du cartésianisme (New memoirs for the history of Cartesianism)*.(A satire of Cartesian philosophy, anonymously by Huet.)

Maignan, E. (1653) *Cursus philosophicus (Philosophical course)*, Toulouse.(A philosophy course by a Minim, which was thought too much a departure from Aristotelianism by some.)

Marandé, L. (1642) *Abrégé curieux de toute la philosophie (Curious summary of all of philosophy)*, Paris.(A summary of what is generally contained in philosophy courses, including a section on theology.)

Moulin, P. du (1644) *Philosophie mise en francois et divisee en trois parties, scavoir, elements de la logique, la physique ou science naturelle, l'ethyque ou science morale (Philosophy translated into French…)*.(A philosophy course, minus metaphysics, by a French Protestant.)

Pourchot, E. (1695) *Institutio philosophica (Philosophical instruction)*, Paris.(The first philosophy course by a professor of philosophy at the University of Paris who was sympathetic to Cartesianism.)

Raconis, C.F.d'A. de (1617) *Summa totius philosophiae (Sum of all philosophy)*, Paris, 1651.(A complete philosophy course by a professor at the University of Paris.)

Sennert, D. (1618) *Epitome naturalis scientiae*, Wittenberg; trans. as *Thirteen books of natural philosophy*, London, 1659.(A physics textbook by a physician who attempts to reconcile Aristotelianism and atomism.)

Aristotelianism, medieval

Although there are many possible definitions, 'medieval Aristotelianism' is here taken to mean explicit receptions of Aristotle's texts or teachings by Latin-speaking writers from about AD *500 to about* AD *1450. This roundabout, material definition avoids several common mistakes. First, it does not assert that there was a unified Aristotelian doctrine across the centuries. There was no such unity, and much of the engagement with Aristotle during the Middle Ages took the form of controversies over what was and was not Aristotelian. Second, the definition does not attempt to distinguish beforehand between philosophical and theological receptions of Aristotle. If it is important to pay attention to the varying and sometimes difficult relations of Aristotelian thought to Christian theology, it is just as important not to project an autonomous discipline of philosophy along contemporary lines back into medieval texts.*

The most important fact about the medieval reception of Aristotle is in many ways the most elementary: Aristotle wrote in Greek, a language unavailable to most educated Europeans from 500 to 1450. Aristotle's fate in medieval Europe was largely determined by his fate in Latin. Early on, Boethius undertook to translate Aristotle and to write Latin commentaries upon him in order to show the agreement of Aristotle with Plato, and also presumably to make Aristotle available to readers increasingly unable to construe Greek. He was able to finish translations only of the logical works, and to write commentaries on a few of them and some related treatises. Even this small selection from Aristotle was not received entire in the early Middle Ages. Of the surviving pieces, only the translations of the Categories and De interpretatione were widely studied before the twelfth century, though not in the same way or for the same purposes. Before the twelfth century, Aristotelian teaching meant what could be reconstructed or imagined from a slim selection of the Organon and paraphrases or mentions by other authors.

The cultural reinvigoration of the twelfth century was due in large part to new translations of Greek and Arabic works, including works of Aristotle. Some translators worked directly from the Greek, among whom the best known is James of Venice. Other translators based themselves on intermediary Arabic translations; the best known of these is Gerard of Cremona. Although the translations from Greek were often the more fluent, translations from the Arabic predominated because they were accompanied by expositions and applications of the Aristotelian texts. To have a Latin Aristotle was not enough; Latin readers also needed help in understanding him and in connecting him with other authors or bodies of knowledge. Hence they relied on explanations or uses of Aristotle in Islamic authors, chiefly Avicenna.

The thirteenth century witnesses some of the most important and energetic efforts at understanding Aristotle, together with reactions against him. The reactions begin early in the century and continue throughout it. The teaching of Aristotelian books was condemned or restricted at Paris in 1210, 1215 and 1231, and lists of propositions inspired by certain interpretations of Aristotle were condemned at Paris and Oxford in 1270 and 1277. However, interest in Aristotle continued to grow, fuelled first by the translation of Averroes' detailed commentaries, then by new translations from Greek. At the same time, some of the most powerful Christian theologians were engaged in large-scale efforts to appropriate Aristotle in ways that would be both intelligible and congenial to Christian readers. Albert the Great composed comprehensive paraphrases of the whole Aristotelian corpus, while his pupil Thomas Aquinas undertook to expound central Aristotelian texts so as to make them clear, coherent, and mostly concordant with Christianity.

Very different projects predominate in the fourteenth century. For John Duns Scotus and William of Ockham, the texts of Aristotle serve as distant ground against which to elaborate philosophical and theological teachings often radically anti-Peripatetic. If they are fully conversant with Aristotle, if they speak technical languages indebted to him, they are in no way constrained by what they take his teaching to be. Other fourteenth-century projects include the application of procedures of mathematical reasoning to problems outstanding in Aristotelian physics, the elaboration of Averroistic positions, and the rehabilitation of Albert's Peripateticism as both faithful and true to reality. By the end of the Middle Ages, then, there is anything but consensus about how Aristotle is to be interpreted or judged. There is instead the active rivalry of a number of schools, each dependent in some way on Aristotle and some claiming to be his unique interpreters.

1 Scope

Before it can be defined, the phrase ‘medieval Aristotelianism’ has to be stripped of a modern presupposition and restricted in its extension. ‘Aristotelianism’ and similar philosophical terms are neither ancient nor medieval, but modern. When these were popularized in the eighteenth century, they were not proposed neutrally. ‘Aristotelianism’ was coined with the meaning that the historical fate of Aristotle’s texts and teachings could be reduced to a pure position, an unhistorical set of propositions that could be analysed or criticized. By contrast, ancient historians of philosophy tended to think of Aristotle’s legacy as a school in some stronger sense, that is, as a succession of communities arising from his writings and attempting to practice the way of life they proposed as best (see Aristotle). Medieval Christians, who thought that their faith prevented them from claiming membership in pagan communities without qualification, often thought of philosophical teaching as an inheritance of human wisdom passed down through lines of authoritative texts and their recognized interpreters. On neither of these ancient or medieval views is the teaching of Aristotle understood or judged apart from one or another of its actual genealogies. This entry is aligned with the earlier views, and so understands ‘Aristotelianism’ as referring to historical engagements with the texts and teachings of Aristotle rather than to some abstract arrangement of ‘Aristotelian’ tenets.

Removing the modern presupposition makes the ambiguities of extension for ‘medieval Aristotelianism’ more difficult. There are, first, ambiguities of appropriation. Aristotelian teachings, texts and methods run through medieval learning from early to late, in almost every discipline and at every level. Many of these appearances are implicit or anonymous: Aristotle’s terminologies or procedures became common learning, no longer considered the property of an Aristotelian school. Clusters of terms such as ‘form/matter’, ‘act/potency’, ‘substance/accident’ or ‘formal/material/efficient/final’ appear in biblical commentaries, legal codifications, pharmaceutical handbooks and guides for composing poetry. Even explicit mentions of Aristotle come in half a dozen forms. Sometimes Aristotle figures merely as an ornament, in much the way that bits of Shakespeare or the Authorized Version of the Bible were once used by English speakers. At other times Aristotle is invoked merely to secure a general principle in no way specific to him. Explicit theoretical engagements with Aristotle themselves range from deployments of single phrases or sentences, through sustained amplification or criticism of arguments, to the detailed interpretation of whole texts. A single writer may show all of these relations to Aristotle over works in different genres or, indeed, in a single work.

Other ambiguities in extension are introduced by the interaction of Aristotle with Jewish, Christian and Islamic religious thinking. The Christian ambiguities are perhaps the most familiar. Almost all of the Christian Aristotelians in the Latin West were members of the clergy. Most spent their professional lives teaching and writing, not the liberal arts or philosophy, but Christian theology. It remains controversial whether or to what extent we can find an autonomous or even a textually distinguishable Aristotelian philosophy among them. Similar difficulties arise in trying to distinguish philosophy from other learned disciplines. Medieval students of Aristotle followed him through the host of topics that he broaches in his writings, from logic to poetics, from the physics of moving bodies through the species of fish to the motions of celestial spheres. We tend to divide these topics according to modern disciplinary divisions, but historically it is all ‘Aristotelianism’ and, in many ways important to medieval writers, all equally ‘philosophy’.

A final set of ambiguities lies around the term ‘medieval’. It is notorious that the ‘Middle Ages’ cannot be cut off neatly, either at their beginning or their end. Many learned medieval people considered themselves direct heirs and successors to pagan antiquity and the early centuries of the Christian churches. They admitted no chronological divide. At the other end, the ‘Renaissance’ is a slogan as much as a fact; there are as many continuities as discontinuities between philosophical thinkers of the thirteenth and fifteenth centuries (see Aristotelianism, Renaissance). Similar uncertainties affect geographical or cultural boundaries. Any span of time appropriately called medieval will include, in territories we now consider European, segments of both the Byzantine and Islamic traditions of Aristotle. Although these traditions figure prominently in any retelling of Latin receptions of Aristotle, they are separate and quite complex traditions that would require separate and substantial treatment (see Byzantine philosophy; Aristotelianism in Islamic philosophy).

Faced with these difficulties of matter, discipline, chronology and geography, the most prudent position is the most modest. Within this article, ‘medieval Aristotelianism’ will be restricted to explicit receptions and examinations of Aristotle’s texts or teachings by Latin-speaking writers from about AD 500 to about 1450. The emphasis throughout will be on explicit relations to Aristotle rather than on diffuse transformations or absorptions of him. No attempt

will be made to distinguish beforehand between philosophers and theologians, though much attention will be paid to the varying and sometimes difficult relations of Aristotelian thought to Christian theology. The arrangement will be according to traditional chronological divisions, though the chronological order is not mean to suggest that the topics or figures discussed can be subsumed under a single history. What follows are not incidents in a single narrative plot, but examples of the diversity of explicit receptions of Aristotle.

2 Boethius and the earlier Middle Ages

As Aristotle wrote in Greek, a language unknown to most educated Europeans from AD 500 to 1450, knowledge of his works in medieval Europe is largely determined by the extent to which they had been translated into Latin. The first important translator was Boethius in the sixth century. Before him, Aristotle seems not to have been translated into Latin in any systematic way. There certainly were Latin summaries of Aristotelian doctrine: one of these, a fourth-century outline of basic logic called *Categoriae decem* (Ten Categories), was widely studied in the earlier Middle Ages on the assumption that it had been written by Augustine. There were also paraphrases or criticisms of Aristotelian doctrine in Latin works, both pagan and Christian. However, these traces are slight, and for good reason. Well into the fifth century, the Roman empire conducted its philosophy in Greek. Citizens even of the westernmost provinces were taught Greek as the language not only of philosophy but also of medicine, natural science and, to some extent, of *belles lettres*.

Boethius may have suspected that this erudite bilingualism would not continue past his own lifetime. More importantly, he himself may have suffered from the increasing inaccessibility of Greek learning. His references to Aristotelian texts outside the Organon appear to derive from notations in the manuscripts he used or from Greek commentators on the logical works (see Aristotle Commentators). It may be that Boethius translated only the logical works of Aristotle because these were the only works he had at hand in Italy.

Whatever the problems of decline in the Latin West, Boethius' stated reasons for undertaking the translations would have been recognized by any Greek-speaking student of philosophy. Boethius translated Aristotle and wrote Latin commentaries on him in order to show the agreement of Aristotle with Plato. The project of reconciliation was already an old one, with multiple sources. Latin philosophy had been eclectic in its borrowing from Greek since Cicero. It was part of Cicero's philosophic identity to take what was best from every philosophic school. This tendency was reinforced and given grander theoretical justification in Neoplatonism from Porphyry on. If there was disagreement among Neoplatonists about the extent to which Aristotle had dissented from Plato, there was unanimity in thinking that Aristotle had accepted much from his teacher and that he had gone on to treat certain subjects with richer detail. Thus almost all of the Neoplatonists, beginning with Porphyry, wrote commentaries on Aristotle (see Neoplatonism). The appearance of these commentaries in Latin during the later Middle Ages influenced scholastic discussions at many points, but they also show that Boethius' project of translation and commentary had a long pedigree. The reconciliation of Aristotle and Plato, which meant most often the subordination of Aristotle to Plato, was a familiar programme by which Boethius could justify his project of translation and commentary.

In the end, Boethius translated the *Categories*, *De interpretatione*, *Prior* and *Posterior Analytics*, *Topics* and *Sophistical Refutations* - in short, all of the logical works of the Organon. He certainly wrote both rudimentary and advanced commentaries for *De interpretatione* and Porphyry's *Isagōgē(Introduction)* to the *Categories* and single commentaries on the *Categories* and *Topics,* as well as the *Topics* of Cicero. Even this small selection from Aristotle was not received entire in the early Middle Ages. The translation of the *Posterior Analytics* was lost early, as was the commentary on the *Topics*. Of the surviving pieces, only the translations of the *Categories* and *De interpretatione* were widely studied before the twelfth century, though not in the same way or for the same purposes. For example, Boethius' first commentary on *De interpretatione*, the more rudimentary one, predominated in the ninth and tenth centuries while the second commentary received much more attention in the eleventh century. With Boethius as in so many later cases, the rule is evident: translation is not the same as reception. Something can exist and even circulate in translation, but not yet be appropriated for speculative use. The reception can be limited for any number of reasons: because copies are scarce, because the work is too difficult, or because learned taste has turned to other topics.

The Aristotelian logic that Boethius had made available passed down to later readers in company with other works, among them the anonymous *Categoriae decem*. Together, these works constituted the curriculum not only in logic

but also in philosophy in general. They provided the instruments and the occasions for reflection on any number of topics, including theological ones. Indeed, the most striking early medieval appearances of Aristotle are in theological debate, for example in Carolingian debates about the Trinity (see Carolingian renaissance). There is also the solitary figure of Johannes Scottus Eriugena, whose *Periphyseon* enacts yet another appropriation of Aristotelian categorical logic into a Neoplatonic metaphysics. Some of Eriugena's readers later reversed the circle by copying bits of his teachings into texts of Aristotelian logical works as explanatory glosses. In the tenth and eleventh centuries, however, attention swung back to the *Categories* and *De interpretatione* with their Boethian commentaries. These were utilized regularly not only for the basic teaching of logic but also for theological debates (about the Eucharist, for example) and for scriptural exegesis (on passages such as Paul's doctrine of salvation in the letter to the Romans).

3 The twelfth century

The cultural reinvigoration of the twelfth century was due in large part to new translations of Greek and Arabic works in philosophy, the natural sciences and medicine. Prominent among these translations were works of Aristotle. It is important to distinguish the various routes by which the new Aristotle arrived in the West, especially as translations were often accompanied by strong interpretations - and not just in the sense that every translation is itself an interpretation.

The first stage in the recovery of Aristotle was neither translation nor interpretation, but the finding and using of manuscripts of Boethius' translations of works other than the *Categories* and *De interpretatione*. It was not that these manuscripts had been lost or hidden away; they simply were not read, taught, annotated or widely copied until a revived interest in logic made them pertinent. The turn back to these Boethian translations was already evident in the 1120s.

By the 1130s, translators had begun to work directly from Aristotle's Greek editions. These first translators worked in northern Italy, chiefly in cities such as Pisa and Venice that had active trading relations with Greek-speaking Byzantium (see Translators). The principal Aristotelian translator is James of Venice, who translated *Posterior Analytics* and *Sophistical Refutations* once again, as well as *Physics*, *On the Soul*, five of the seven so-called *Parva naturalia* (Smaller Natural Works) and *Metaphysics* 1-4.4. James also translated at least some parts of late Imperial Greek commentaries on Aristotle, but these translations did not circulate widely.

James wrote his own commentary, using Byzantine models, on the *Sophistical Refutations*, making him one of the earliest Latin writers to comment on the so-called 'new logic'. This 'new logic' contained segments of the Organon that were either unstudied or untranslated before the twelfth century. It provided not only any number of technical teachings, but also the doctrine of the *Posterior Analytics* on the nature of demonstratively organized bodies of knowledge. This doctrine made it possible to construct a comprehensive account of 'science' within which physical, mathematical, metaphysical and even theological doctrines could be ordered and criticized (see Logic, medieval). However, even with the recovery of Boethian versions and the new translations of James and his colleagues, something less than one-third of what we today consider the Aristotelian corpus was then available in Latin. Notably lacking were the foundational works in physical science.

Some of these gaps were soon filled by another species of translation, translations into Latin of Arabic versions of Greek works (see Islamic philosophy: transmission into Western Europe). These translations were made in areas of greatest contact with Arabic civilization, principally in Spain. Although these translators followed the translators in northern Italy by three decades, their versions of Aristotle taken from Arabic were to become more important than those made directly from the Greek. The reason is not to be found in the clarity of translation: the Greek versions are generally more fluent, not so say more accurate. Rather, what was needed was not so much texts as textbooks. Confronted with the bald text of Aristotle, many readers were at a loss. They needed tutors, and they had in their Arabic sources more powerful pedagogical aids than they had yet found in Greek. The Arabic texts of al-Farabi or Avicenna (see Ibn Sina) showed how Aristotle could be applied to questions of interest to Latin readers. They also offered more immediately attractive forms of specialized or technical knowledge. Some idea of the allure of this knowledge can be seen in the biographies of the translators: they came from all parts of northern Europe, including England and the Low Countries, to work in Toledo, Barcelona, Tarazona, Segovia, Leon, Pamplona and southern France (see Translators). The most prominent of the translators working in Spain was an Italian, Gerard of Cremona.

Gerard's work as a translator spans about forty years (*c.*1150-87), during which time he translated at least seventy works and perhaps as many as a dozen more. His translations of Aristotle include *Posterior Analytics* (with the commentary of Themistius), *Physics*, *On the Heavens*, *On Generation and Corruption* and *Meteorology* 1-3. Two of these works had, of course, already been translated by James of Venice from the Greek, but that was either not known or did not matter to Gerard. The separation of the Italian and Spanish translations can also be seen as Gerard began translating Aristotelian commentaries from the Arabic. Some of these commentaries were originally Greek (for example, Themistius on the *Physics*), though Gerard translated them from Arabic. Other commentaries and expository treatises had been written in Arabic as part of the Arabic culture's own appropriation of Greek learning (as in the case of al-Farabi's commentary on the *Physics*).

Two related facts provide important context for Gerard's Aristotelian translations. The first is that the Aristotelian translations were only a small part of his labour; he translated many more works on medical, astronomical and mathematical subjects. Gerard's Aristotle came into Latin surrounded by a small library of natural science. The second fact is that Gerard translated a number of works as part of the Aristotelian corpus that were not at all Aristotelian. The most important of these is the so-called *Liber de causis (Book of Causes)*, a compilation of material mostly from Proclus (see Liber de causis). This treatise on the cosmic participation of such transcendental features as goodness or unity was read for about a century after Gerard's translation as if it had been written by Aristotle, and so guided interpretations of the whole Aristotelian corpus. Other pseudonymous Aristotelian works circulating by the end of the twelfth century included treatises on the properties of elements, on how the soul causes basic bodily operations, on health and on alchemy. The presence of such heterogeneous works within the Aristotelian corpus would complicate the reading of Aristotle beyond the end of the Middle Ages.

The most dramatic effects of the Arabic and Neoplatonic Aristotle on Latin-speaking thought did not occur until well into the thirteenth century, but it is important to suggest how the new texts were already being received in the twelfth century. The most thorough reception was that of the logical works, which began to be appropriated in the schools of liberal arts as early as the 1130s. There are traces of the 'new logic' in the later works of Peter Abelard, but the impact is felt primarily in the next generation of writers, especially after the middle of the century, in the works of Adam of Balsham 'Parvipontanus', Alberic of Paris and Geoffrey of St Victor, with their colleagues and followers. The impact is not what one might expect. The first works of the 'new logic' to have an impact were the *Sophistical Refutations* and the *Topics*, which were read for what they could contribute to the analysis of procedure in disputation and to an understanding of signification and fallacies. The *Prior Analytics* was much slower in displacing Boethius' teaching on syllogism, and the *Posterior Analytics*, which might seem the most important work, was the last to make its teaching felt. Equally interesting is the fact that the new Aristotelian texts were not received through the writing of detailed, literal commentaries; these did not appear until the next century. The new logic was received rather as an aid or instigation to projects of logical research that had begun before these texts were known. The effects also vary by topic or tradition of inquiry. For example, Peter Helias' *Summa* on Priscian, written *circa* 1150, contains half as many references to Aristotle as to Boethius (see Language, medieval theories of).

The physical works had an even more patchy reception. Traces of the early translations from the Greek can be found in the writers associated with the cathedral school at Chartres (see Chartres, school of, and especially William of Conches). At the same time, if not earlier, bits of Aristotelian natural science began to figure in the teaching texts of the medical school at Salerno. By the end of the century, Urso of Salerno had written a treatise *On the Mixture of the Elements*, which was an attempt to resolve a vexed question in Aristotelian physics: what kind of virtual existence do the properties of individual elements have when those elements enter into compounds actualized by another substantial form? The whole of natural philosophy and medicine had hardly become Aristotelian, however. It could not, since so much of the scientific corpus remained untranslated. At century's end, the sum of translations available in Latin came to just half of the Aristotelian writings. There were, for example, no Latin versions of the bulky books on animals: together, these zoological treatises make up one-quarter of the whole corpus, and they contain the longest single Aristotelian book, *History of Animals* (see Natural philosophy, medieval). Nor had translators yet gone far into the ethical, political or literary parts of the corpus. There is an anonymous twelfth-century translation of *Nicomachean Ethics* II and III, but that is the only piece attested; there is nothing from *Politics*, *Rhetoric* or *Poetics*.

4 The thirteenth century

At the beginning of the thirteenth century, in scattered places and among diverse writers, there was a growing uneasiness about the Aristotelian and Islamic works entering Latin at such a rapid rate. This unease was evident particularly among theologians, who saw the possibility that the Aristotelian natural philosophy would contradict or displace views on the natural world considered essential for Christianity. One early official reaction came in 1210, at a provincial synod of the archdiocese of Sens, the ecclesiastical authority responsible for Paris and its schools. The archbishop was Peter of Corbeil, master of theology and of canon law at Paris from 1190-98. He knew and endorsed the view of his former colleagues that there were heresies in theology (linked to the works of Amaury of Bène and David of Dinant) and dangerous teaching in the faculty of liberal arts, sparked by the newly translated books. The heresies are difficult to reconstruct, in part because they were so effectively suppressed. The measures taken against the teaching of Aristotle and his interpreters, certainly Avicenna and possibly Alexander of Aphrodisias, were relatively milder. The assembled bishops ordered that no books of Aristotle on natural philosophy or their commentaries were to be lectured on at Paris, in public or in private, under penalty of excommunication. The prohibition seems to have been ineffective: a weaker prohibition is reiterated five years later, in the statutes of the papal legate, Robert of Courçon. His statues only prohibit public lecturing on ‘the books of Aristotle on metaphysics or on summaries of them’ within the faculty of arts. Even this prohibition was barely effective; it was reiterated in a papal letter of 1228, but softened to compromise three years later. Pope Gregory IX then ordered that the theologians should confine themselves to questions that could be settled from theological authorities, while the masters of liberal arts were to refrain from lecturing on the prohibited books until they had been examined and expurgated by an expert committee. A committee was indeed appointed, but seems never to have done its work. From 1235 on, Aristotelian works were studied with increasing diligence and attention in their original, unexpurgated versions. By the end of the 1240s, at the latest, their study was not only permitted but required in arts faculties and they were in constant use by the most eminent theologians, despite the fact that Gregory’s prohibitions were reiterated pro forma in 1245 and 1263.

It is difficult to say how much expert acquaintance informed the reaction against Aristotle. Aristotelian books were regularly confused with works translated alongside them or purporting to be drawn from them. Hence the decrees of 1210 or 1215 can be regarded as uninformed protests against a poorly known physicalism in which Aristotle was implicated. Even two or three decades later, theological authors at Paris who cited Aristotle frequently continued to judge harshly the materialism they thought latent in him, and which they found expressed by some of his commentators or disciples. William of Auvergne for example, rails against Alexander of Aphrodisias’ doctrine and heresies related to it, and against physicalist biases in Avicebron (see Ibn Gabirol) and Avicenna. The entangling of Aristotle with his interpreters was only made worse by the appearance in Latin of the works of Averroes (see Ibn Rushd).

Latin versions of many of the commentaries of Averroes began to circulate early in the second quarter of the thirteenth century. The most important group of these was produced by Michael Scotus in the 1220s and 1230s. Averroes had written three kinds of commentaries: epitomes, ‘middle’ commentaries, and ‘great’ or ‘large’ commentaries. These three genres represent increasing levels of attention to the letter of Aristotle’s texts, with the ‘great’ commentaries being by far the most detailed. Michael Scotus had a preference for these: he translated the ‘great’ commentaries on *Physics*, *On the Heavens*, *On Generation and Corruption*, *Meteorology*, *On the Soul* and *Metaphysics*. Other translators rendered Averroes’ middle commentaries on most of the Organon and on the *Nicomachean Ethics*. If these expositions helped Latin readers to interpret Aristotle and to avoid the difficulties or controversies that had trapped earlier readers, they also created many difficulties for Christians. These difficulties lay not so much in the differences between Christianity and Islam as in those between Christianity and Aristotle’s paganism, since Averroes was often painfully clear about Aristotelian teachings that contradicted the revelations of both the Bible and the Qur’an.

The story of condemnation and appropriation at Paris should not be taken as the only story about the reception of Aristotle. There are others elsewhere, including some at schools that had steady traffic with Paris. John Blund, for example, seems to have taught at both Paris and Oxford early in the thirteenth century. His *On the Soul*, which probably derives from a course of lectures given at Oxford in Arts, draws heavily from Avicenna in the interpretation of Aristotle. More important but more obscure is the career of Robert Grosseteste. Grosseteste may have studied and taught at both Oxford and Paris before 1214; by the 1220s he was a theologian of reputation at

Oxford. Before or around this time, he was engaged in writing commentaries on a range of Aristotelian works. After he was made bishop of Lincoln in 1235, Grosseteste organized a team of translators that produced a Latin version of the *Nicomachean Ethics* and Greek commentaries on it. Another example can be found in Richard Rufus Of Cornwall, who like many of his brethren was a mature scholar when he joined the Franciscans at Paris in 1238. He had already composed commentaries on both *Metaphysics* and *Physics*. However, the influence of these works would be felt most at Oxford after he began teaching theology there in 1250. Both commentaries show an acquaintance with Averroes and such parts of earlier commentary traditions as Averroes records. Rufus' work also shows his concern to resolve the contradictions between Aristotle and Christian revelation by holding Aristotle to the highest Aristotelian standards.

Aristotle was widely read by the middle of the century, but the work of receiving him was hardly finished. It was now up to Latin readers to construct coherent and defensible readings for an expanded and much controverted corpus. One response was to make Aristotle accessible by systematizing him with available bodies of knowledge. Around 1250, Albert the Great undertook to write paraphrases of the entire corpus in order to make Aristotle 'intelligible for the Latins'. The project stretched out over twenty years and required that Albert fill gaps in the corpus with what he thought Aristotle had taught. The concern throughout was to make whatever was true in Aristotle cohere with the rest of speculative knowledge, which in Albert's case meant to cohere both with a Neoplatonic metaphysics and with specialized sciences not discussed by Aristotle or not known to him.

Another interpretative project was more concerned with finding a coherent teaching across the Aristotelian texts. Around 1266, Thomas Aquinas inaugurated a series of line-by-line expositions of Aristotle. Their form depended partly on that of Averroes' 'great' commentaries, but more exactly on models that Thomas had learned in the arts faculty at Paris twenty years earlier. More importantly, Thomas was borrowing the modified Averroistic format to show that it was possible to read Aristotle against Averroes on disputed points such as the demonstrability of the eternity of the world (see Eternity of the world, medieval views of), the individuality of human intellects or the substantial union of human soul and body. Thomas undertook to expound only some of the most important Aristotelian books or parts of books, and his expositions limit themselves at most points to giving the briefest reading consistent with clarity and coherence. They do not rehearse many controversies or tease out many subtleties, and they rarely bring in alternate accounts of the things discussed. The simplicity of Thomas' commentaries made them influential even among readers not otherwise favourable to him.

Thomas was aided in his work of exposition by yet another effort of translation. A fellow Dominican, William of Moerbeke, had begun around 1260 to retranslate from the Greek most of the principal works of the Aristotelian corpus. More importantly, he translated for the first time some of the principal ancient commentaries on Aristotle, including that of Alexander of Aphrodisias on *Metaphysics*, Ammonius on *De interpretatione*, and both Philoponus and Themistius on *On the Soul*. These texts were acquired avidly by Thomas Aquinas and others as witnesses to the authentic meaning of Aristotle, a meaning different from that thought to have been imposed by Averroes. The Averroistic Aristotle was being confronted with an arguably Greek Aristotle, who was on many points made more congenial to Christian teaching.

The question of how far Albert and Thomas were Aristotelians in their own thinking has been debated for centuries without resolution. On the one hand, it is certainly the case that neither Albert nor Thomas called themselves Aristotelian. Albert several time reminds his readers that he is expounding Aristotle, not endorsing him. Thomas will not even use the word 'philosopher' when speaking of Christians, much less of theologians. On the other hand, many of their contemporaries in the faculties of theology thought that they were all too ready to accept Peripatetic doctrines uncritically. In 1273, for example, Bonaventure gave a series of lectures at Paris in which he excoriated those who based philosophy or theology on Aristotelian doctrines. Bonaventure identifies the principal Aristotelian errors in physics, ethics and metaphysics, thus showing his own technical mastery of the Aristotelian corpus. If much of Bonaventure's anger is directed at teachers of arts, some of it at least is reserved for theologians who embrace the same errors.

The controversies occasioned by the teaching of Aristotle in the arts faculty were not confined to the writing of alternate commentaries and counterattacks. They resulted in two sets of ecclesiastical condemnations at Paris, one in 1270 and a second, much larger and more important, in 1277. A prominent target of the first condemnations was Siger of Brabant. Around 1265, when Siger was a master of arts, the controversy over the radical reading of

Aristotle began to build between the faculty of theology and the faculty of arts at Paris. This has often been described, rather inaccurately, as a quarrel between 'Augustinians' and 'Latin Averroists' (see Augustinianism; Averroism). The 'Augustinian' theologians were in fact, if unknowingly, indebted to Plotinus and Avicenna as well as Augustine, and they often engaged in the constructive interpretation of Aristotle. The 'Latin Averroists' were so described not just because they took up Averroes' commentaries, but because they were thought to teach a number of Averroes' controversial doctrines, including the subordination of religion to philosophy (a doctrine misleadingly described as 'double truth'). Behind these labels, the quarrel was clearly a fight over claims for autonomy not only on behalf of philosophical speculation, but also of a philosophical way of life. The arts were repeatedly attacked for asserting not just that they could demonstrate conclusions while keeping out of view the articles of Christian faith, but that the study of philosophy or the practice of natural contemplation could lead to happiness.

Many of the accused denied the charges, and it is difficult to know how much the teachings of the 'artists' were distorted in polemic and in the ensuing legal proceedings. Siger himself was already in trouble with ecclesiastical authorities as early as 1266. A first set of general condemnations came in December, 1270. Etienne Tempier, Bishop of Paris, condemned thirteen propositions drawn from Siger's writings. Fifteen months later, masters in the arts faculty were prohibited from disputing theological matters or from determining philosophical questions in a way contrary to the faith. Finally, in 1276, Siger and two other masters from Brabant were summoned before the inquisitor of France to answer charges of heresy. It is not clear what happened to Siger afterwards. Finally, some 219 propositions were condemned by Tempier in Paris on 7 March 1277. The list was hastily composed by a mostly anonymous committee, and even its defenders would later admit that it contained inconsistencies and points which were not clear. A much shorter and better organized list was condemned at Oxford eleven days later. The Oxford list proscribed thirty propositions divided under the headings of logic, grammar and natural philosophy.

The 219 condemned propositions cannot be summarized: they are too imprecise and heterogeneous. Some of the propositions declared false evidently contradict the Christian faith. Others, however, seem to have been rejected because they relied on argumentative procedures or presuppositions that troubled the theological censors. Among these are some procedures that would figure prominently in speculative thought during the next two centuries: the distinction between God's power as unrestricted and as exercised (*potentia absoluta*, *potentia ordinata*), or the analysis of physical problems by conceiving alternate worlds or by transposing them to an imagined vacuum. In these ways, the list of propositions shows not just the topics of controversy between theologians and teachers of arts, but the budget of topics considered worthy of investigation by students of Aristotle.

There has been considerable contemporary dispute over the importance of the condemnations of 1277. Some have held that they were a local aberration forgotten after a few decades, others that they had a chilling effect on theological speculation for a century or more. In either case, it is worth remembering that the condemnations were not seen as a rejection of Aristotle, but rather of a certain sort of Aristotelianism. Henry of Ghent, for example, who authored some of the condemnations, placed himself as a theologian in the tradition of Augustine, but knew Aristotle well and used his knowledge frequently in exploring or defending theological points. Indeed, Aristotelian terms, principles, examples and arguments had so permeated theological learning by the end of the thirteenth century that no theologian, no matter how critical of certain points in Aristotle, could be anything less than fluent as an Aristotelian.

5 The fourteenth and fifteenth centuries

Two figures dominate the reception of Aristotle at the beginning of the fourteenth century: John Duns Scotus and William of Ockham. They would determine the reading of Aristotle not only by their own efforts, but by the prominence of their disciples over the next two centuries.

No brief description of the engagement of either Duns Scotus or Ockham with Aristotle can fail to be misleading. The thought of each is not only difficult, but continues to occasion strikingly different interpretations, let alone evaluations. Duns Scotus' writings are brutally original in manner of expression and teaching. Ockham writes more conventionally, but in the service of a critique of prevailing views no less sharp. Neither hesitated to reject central Aristotelian teachings: Duns Scotus denies Aristotle's accounts of intellection and substantial individuation, Ockham the accounts of linguistic foundations and ethical truth. Again, neither was to provide literal expositions of Aristotle's works or other rudimentary exegetical works, genres in which they might have

expressed general positions on Aristotle.

Both Duns Scotus and Ockham did write what are sometimes called commentaries on Aristotle. Duns Scotus wrote an early treatise in connection with *Metaphysics*, as well as multiple treatments of issues in *Categories*, *De interpretatione*, *Sophistical Refutations* and Porphyry's *Isagōgē*. These 'commentaries' engage prevailing disputes attached to the Aristotelian texts by only the frailest threads: Duns Scotus uses his writing to declare and defend positions on these disputes rather than to set out a simple reading of Aristotle. Ockham also wrote on the four logical works, with the aim of showing that none of them required a realist view of language or conception. He wrote in three different genres on *Physics*: in an exposition, a *summulae* (summary) and a set of disputed questions. The balance of exegesis and dispute varies in these three, but some indication of Ockham's authorial position may be given by the *summulae*; he begins that work with the assertion of a number of his characteristic positions, such as the non-existence of universals and the strictness of the criteria for scientific demonstration. Neither Duns Scotus nor Ockham was concerned to present a comprehensive interpretation of the Aristotelian corpus after the different styles of Averroes, Albert or Aquinas.

Still, it would be inaccurate and unjust to suggest that Duns Scotus and Ockham were incapable of close exegesis, just as it would be unjust to conclude that Scotistic or Ockhamistic views somehow precluded engagement with Aristotle. One of the most systematic commentators on Aristotle in the fourteenth century was John Buridan, a near contemporary of Ockham who shared many of the latter's concerns for linguistic and conceptual criticism. In the 1320s, Buridan began writing a mixture of expositions and disputed questions on Aristotle's books, frequently writing in both genres on a single book. Eventually he covered almost the entire corpus, with the exception of the *History of Animals* and the *Poetics*, doing so with careful attention to Aristotle's purposes and meanings. If Buridan's 'nominalism' was anti-Aristotelian, it certainly did not prevent him from being a tenacious expositor of Aristotle.

Scotistic or Ockhamistic views entered into combination with several other projects for explaining, extending and correcting Aristotle. One of these projects found an institutional home in Merton College, Oxford, with a group active from the 1320s onwards (see Oxford Calculators). The principal figures among these 'calculators' were Thomas Bradwardine, Richard Kilvington, William Heytesbury, Richard Swineshead and John Dumbleton. There are numerous differences among them, as there are numerous similarities linking them to their colleagues working in the established logical genre of sophisms. What the Mertonians share are procedures of mathematical reasoning as applied to the resolution of problems outstanding in Aristotelian physics. One central problem concerned the intensification and remissions of accidental forms, while another concerned the motion of projectiles. These problems in Aristotelian physics were not discovered in the fourteenth century; they had been known to late Roman and Islamic commentators, as well as to readers in the prior two centuries. What distinguishes the treatment of these problems among the calculators is not so much the statement of the problem or even its doctrinal resolution, but the sophistication of its mathematical development. In the case of projectile motion, for example, members of the groups posited an inner force or *impetus*, which they then proceeded to describe through accelerations and decelerations (though this doctrine too may derive from previous commentaries on Aristotle).

The methods of the Mertonians were to have considerable consequences for the reading of Aristotle's *Physics*. The theologian Nicole Oresme, a student of Buridan, having learned a basic reading of the principal texts of Aristotle and a nominalist critique of them, went on to take up the methods of mathematical analysis. He wrote sets of questions on a number of Aristotelian texts, as well as vernacular commentaries on the *Nicomachean Ethics* and the *Politics*. His masterwork is a dialectical response to Aristotle's *On the Heavens*. Here, Oresme first expounds the literal sense, next extracts the principal theses, then produces arguments for their negations and finally affirms either the thesis or its negation depending on his judgment of the matter at hand.

A second approach to the relation of Duns Scotus or Ockham to Aristotle was a frank rehabilitation of Averroes. The principal figures of this movement were John of Jandun, Thaddeus of Parma and Angel of Arezzo. John of Jandun was a master of arts at Paris in the first decade of the fourteenth century, and wrote disputed questions on the central works of Aristotelian physics and metaphysics. In these questions, John frequently rehearses the readings of his predecessors, including Thomas Aquinas (whom he calls 'old expositor'), but then asserts quite plainly the views of Averroes, which agree with those of Aristotle. John confronts contradictions between an Averroistic Aristotle and Christian doctrine with a simple and unexplained profession of faith.

A third aspect of the fourteenth-century reception of Aristotle, widespread in faculties of theology across northern Europe, took the form of a perceived recovery of essential Aristotelian truths, against all rivals. Jean Gerson, who became chancellor of the university of Paris in 1395, describes three contending schools of thought: ‘formalizers’, ‘nominalists’ and ‘Peripatetics’. Each of the three groups claimed medieval proponents: the formalizers claimed Duns Scotus, the nominalists claimed Ockham and Buridan, and the Peripatetics claimed Albert and Thomas. Each group was also held to reflect or descend from an ancient source: the formalizers from Plato, the nominalists from Epicurus and the Peripatetics, obviously, from Aristotle. The Aristotelian tradition invoked here is that of a specific line of thinkers. One writer traces it from Alexander of Aphrodisias and Themistius, through Boethius and John Philoponus, Avicenna and Averroes, to Albert the Great and Thomas Aquinas. The tradition is also characterized by a set of conclusions that emanate from the view (very roughly) that the human mind knows fixed, universal truths by abstracting universals from singulars, which it does without the need of any special divine assistance. This was taken to be the foundation of Aristotle’s teaching and, by its proponents, the foundation of sound philosophy or theology.

This school called itself Peripatetic and also, perhaps surprisingly, Albertist. The preference for Albert over Thomas is evident in a group of writers which included John of Maisonneuve and his student, Heimeric de Campo. John taught as master of arts in Paris from 1400 onwards, while Heimeric was master of theology at Cologne and Louvain from 1428 onwards. John wanted to defend against both nominalists and formalizers a cognitive realism grounded in appeals to the divine ideas. Heimeric extended this Albertist project into a sustained critique of Thomas Aquinas. If both John and Heimeric seem at times to attribute certain views to Albert unreflectively, they are equally capable of careful readings in which they argue for Albert’s Aristotle as the most accurate and the truest. Albert’s work is presented as the completion of Aristotelian inquiry.

There is obviously no final medieval consensus about the reception of Aristotle, as there is no end to the traditions of ‘medieval Aristotelianism’. The main medieval appropriations of Aristotle propounded around 1450, whether Albertist, Thomist, Scotist or Ockhamist, would continue to find advocates up into the twentieth century, especially in Roman Catholic schools and universities. Particular parts of the medieval Aristotle would also survive in general philosophical learning. The most obvious survival was of the logical doctrines, which attracted readers as astute as Kant, despite repeated attacks. Medieval versions of Aristotle on intellection would influence the development of modern epistemology at many points, saliently in the terminology of Descartes, Wolff and their various followers. Even medieval receptions of Aristotelian physics would have a long afterlife: Galileo’s critique of Aristotle owes much to late medieval debates over objections against Aristotelian texts in the ancient commentary tradition (see Galilei, Galileo).

Aristotelianism, Renaissance

By the Renaissance here is meant the period of the fifteenth and sixteenth centuries during which there was a deliberate attempt, especially in Italy, to pattern cultural activities on models drawn from antiquity. However, Aristotelianism during that period was not cut off from medieval developments, since earlier interests and topics of discussion still held the attention of philosophers, theologians and non-academic intellectuals. Moreover, given that Aristotelianism was embedded in the university curriculum, the approach and activities of Renaissance Aristotelians often reflected earlier institutional developments. The educational reforms of the German Lutheran Philipp Melanchthon and of the newly-founded Society of Jesus (the Jesuits) ensured that Aristotle remained central to the curriculum. On the other hand, deliberate attempts to divorce themselves from earlier structures and approaches can be discerned in some Renaissance Aristotelians. Owing to the influence of humanism, professors of philosophy whose loyalty was to Aristotle came to study Greek and explicate Aristotle from the Greek text, to imitate the style of classical models, and to prefer the Greek commentators over the medieval Latins because their language was Greek.

Renaissance Aristotelianism did not constitute a uniform, coherent school of thought with a clearly defined body of doctrines shared by all adherents. A careful reading of the many commentaries, paraphrases, textbooks and treatises based on Aristotle's works reveals a surprisingly wide variation in interpretation and a strong tendency to modify or supplement the Stagirite's teachings with tenets derived from other philosophical or scientific sources or from contemporary interests and discoveries. It is perhaps wise to speak of a variety of Aristotelianisms rather than to perpetuate the long-standing caricature of 'modern' philosophy and science arising by throwing off the shackles of a monolithic Peripatetic orthodoxy. The various Aristotelianisms included Albertism, Thomism, Scotism and Averroism, but as a result of the new translations of the Greek commentators on Aristotle there were also Renaissance Aristotelians who approached Aristotle by way of Alexander of Aphrodisias, Themistius, Simplicius and John Philoponus. Another current is best described as 'eclectic Aristotelianism'. Some Aristotelians adopted a 'philological' approach, approaching Aristotle simply through analysis of the Greek text and not as a philosophical challenge. This approach made Aristotelianism irrelevant to the enterprise of philosophy, but fortunately did not predominate.

1 Aristotle, the Greek text and the Greek commentators

Although Aristotle was accorded the honorific title of 'The Philosopher' by most philosopher-theologians of the high Middle Ages (see Aristotelianism, medieval), there were also some who viewed him far less favourably. The fourteenth-century Franciscans Francis of Meyronnes, Antonius Andreas and John Canonicus carried Bonaventure's critique of Aristotle to its ultimate conclusion (see Bonaventure). The first called Aristotle 'the worst metaphysician', and both Andreas and Canonicus viewed him as a poor natural philosopher. Their critical views were known to Renaissance Aristotelians like Nicoletto Vernia, Agostino Nifo and Marcantonio Zimara (*c*.1475-1532). Nevertheless, Aristotle's influence on philosophy and science during the Renaissance was profound. Both his own works and those of his many late ancient and medieval interpreters attracted a wide audience. His writings on logic and natural philosophy formed the centrepiece of university studies in the arts and provided essential preparation for a career in medicine, law or theology, while his works on ethics, poetics and politics were widely read and discussed by a learned public increasingly educated in the schools of the humanists.

Despite the emphasis given to Renaissance Platonism in general histories of culture, a survey of the philosophical and scientific literature actually produced during the period from 1400 to 1600 clearly establishes the Renaissance as a golden age in the history of Aristotelianism. Since Renaissance philosophers trained in the arts faculties of major European universities had normally received a thorough grounding in Aristotle, those who became professors in their own right for the most part continued to base their instruction on the Aristotelian corpus. Their writings often reflected this, taking the form of commentaries on Aristotle, though works devoted to the systematic exposition of a particular topic - such as Pietro Pomponazzi's famous treatise *De immortalitate animae (On the Immortality of the Soul)* (1516) or Jacopo Zabarella's *De naturalis scientiae constitutione (On the Nature of Natural Science)* (published in 1586) - were not infrequent, particularly when aimed at a general learned audience rather than at other scholars (see Pomponazzi, P. §2; Zabarella, J. §6). Aristotle's dominance among university professors withstood the challenge mounted by the handful of appointments of chairs of Platonic philosophy in

Italy (see Platonism, Renaissance §5).

Much of the continued predominance of Aristotle was due to the work of humanists, their knowledge of Greek, and the new critical techniques they developed. The Greek text of Aristotle's works was published, notably in the edition of 1495-8 printed by Aldo Manuzio. New translations were done, and from the 1530s onward, bilingual editions were produced. From 1499 onward, but especially in the 1520s and 1530s, editions of the Greek commentators on Aristotle were printed, and these in turn were translated, many for the first time. Nor was attention paid only to the Greek commentators, for in 1483 Nicoletto Vernia edited an important Aristotle-Averroes edition, and 1550-2 saw the great Giunta Aristotle-Averroes edition containing many works not previously included. The Aristotle commentaries of such medieval Latin authors as Albert the Great and Thomas Aquinas were also printed. At the same time, attention was paid to the canon of Aristotle's work. Many dubious and spurious works had been excluded by 1600. On the other hand, the *Poetics*, which had been little read during the Middle Ages, came to have a great influence on literary criticism, and the pseudo-Aristotelian *Mechanics* also attracted a good deal of attention.

2 Logic and method

Renaissance Aristotelians developed an account of scientific methodology that built on insights put forward by Aristotle (§6) in his *Posterior Analytics* and *Physics*. In a well-known passage in the *Posterior Analytics* Aristotle distinguishes between two types of demonstration. The first he calls demonstration of the fact (*to hoti*) or demonstration *quia*. Its primary characteristic is that the middle terms of such demonstrations tell us only the fact that something is the case and not why this is the case. The second type of demonstration has a middle term that tells us the reason why (*to dioti*). Medieval thinkers inspired by this analysis connected Aristotle's remarks on demonstration with his remarks at the beginning of the *Physics* concerning the proper method for establishing the principles of nature. There Aristotle claims that one should start with those things that are more knowable to us and proceed to those things more knowable or intelligible by nature, though not to us. In addition, some later thinkers equated two methods set forth by Galen (§§3-4) with the two sorts of demonstration. In his *Art of Medicine*, Galen distinguishes between what he calls the method of resolution, in which an object is broken down into its component parts, and the method of composition, in which the components used in the resolution are put into their proper order. Late medieval Aristotelians, like Pietro d'Abano (1257-1315) in his *Conciliator differentiarum philosophorum et praecipue medicorum (Conciliator of the Differences between Philosophers and Especially Physicians)* (composed around 1300), conflated demonstration *quia* and *propter quid* with resolution and composition, and were thus able to offer a sophisticated account of both the method of scientific discovery and the proper way to order such knowledge.

Paul of Venice, a member of the Augustinian Order who studied at Oxford before returning to teach at Padua, sets forth the procedure of going from effect to cause and back to the effect, and defends it against the charge of circularity. He is also careful to note that demonstration in natural science does not yield the necessity and certitude of mathematics, since it deals with what happens for the most part. Natural science is thus a demonstrative science, but is only a science of what usually occurs. Two contemporaries of Paul, Hugo of Siena and Jacopo da Forli, also discuss the resolutive method. However, it is Nicoletto Vernia (§3) who examines in greater depth questions regarding demonstration and the resolutive method in his Paduan lectures on the *Posterior Analytics*. Vernia also takes up the question whether demonstration is circular. He points out that there must first be a movement from an effect by way of demonstration *quia* but thereafter there must be a return back to the effect if natural science is to be perfect. That is to say, after the resolution (*resolutio*) of an 'effect' - that is, what is experienced through the senses - into an initial universal knowledge, we still lack demonstration *propter quid*, which is knowledge based on the essential principles of the thing. Vernia therefore postulates a movement of the intellect (*negotiatio intellectus*) enabling it somehow to discern the true cause of the effect and the necessary causal connection of that cause to its effect. A genuine apodictic demonstration *propter quid* is the result.

The topic of resolutive or regressive method (*regressus*) was also treated by Agostino Nifo (§2), Vernia's former student. In his youth he too postulated a movement of the intellect (*negotiatio intellectus*) enabling it to discern the true cause of an effect so that a strict demonstration was possible. However, later in his career, after studying the Greek commentators, namely Alexander of Aphrodisias, Themistius, Simplicius and Philoponus, he denied the need for such a special movement of the intellect and held that the most that could be achieved in natural science

was a hypothetical syllogism and a hypothetical demonstration.

Discussions regarding these methodological issues are also to be found in such contemporaries as Marcantonio Zimara and Bernardinus Tomitanus (d. 1576). But it is Jacopo Zabarella (§5), a student of Tomitanus, who stands at the end of this long line of development. In his treatise *De regressu (On the Regress)*, Zabarella sets forth a systematic discussion of the nature of scientific investigation in which he assumes like the earlier theorists a basic continuity between Aristotle and Galen. He argues that demonstration *quia* provides us with a method of reasoning from effect to cause, but does not tell us the proper reason for the effect. Nevertheless, from the cause to which our initial knowledge of the effect leads, we can eventually achieve a full account of the proximate cause of the effect. That is, we can arrive at an argument that fully reveals the cause by giving a *propter quid* demonstration that states the reason why. What keeps this regressive method from being purely formal is the positing of the intermediate step of the movement (*negotiatio*) of the intellect, going from an initially confused and improper knowledge of the cause to a distinct and proper knowledge of it (see Galilei, Galileo).

3 Natural philosophy

One of the issues discussed by medieval Aristotelians that continued to concern Aristotelian philosophers during the Renaissance was the identification of the subject of natural philosophy. This issue was thought to be important because it concerned not only the relationship between metaphysics (the science of being *qua* being) and natural philosophy, but also the place of immaterial created beings, such as angels, within Aristotelian science. Thomas Aquinas (§9) had argued that mobile or changeable being (*ens mobile*), which seems to include all beings liable to change (that is, everything other than God), was the subject of natural philosophy, whereas his teacher Albert the Great (§4) took it to be mobile or changeable body (*corpus mobile*). Later, Paul of Venice states that the subject matter is natural body (*corpus naturale*), while his student, Cajetan of Thiene (Gaetano da Thiene) (1387-1485), maintained that it is sensible substance (*substantia sensibilis*). Subsequently the whole issue was approached in a systematic fashion by Cajetan’s student, Nicoletto Vernia (§3), who composed a separate question on whether mobile being is the subject of all natural philosophy. In it he reviews and compares a wide range of authors including Antonius Andreas and John Canonicus, whom he attacks for judging Aristotle to have erred in natural philosophy. Vernia accuses them of not speaking naturally but rather introducing theological considerations into the discussion, namely the question of the motion of angels. Vernia himself upholds and defends mobile being as the subject, which he took to be the position of Averroes. Thereafter Vernia’s student Agostino Nifo (§2) took up the question of the subject matter of natural philosophy in his commentary on the *Physics*. He rejects the respective positions of Albert and Aquinas but then attempts to conciliate them, arguing that mobile being can be considered the subject of natural science if by subject is meant the genus or most general predicate applying to the things considered in natural science, whereas mobile body can also be considered the subject if by that is meant the most general species to which all and only the things considered in natural science belong. He presents Averroes as holding that the total subject of natural science is a sensible thing (*res sensibilis*) in so far as it moves, that is, in so far as it contains the principle of motion.

Jacopo Zabarella (§6) who, like Vernia, wrote a systematic work on the question of the subject of natural philosophy, echoes the earlier discussions. He declares the common subject of all natural science to be body taken universally (embracing both the earthly bodies and also the bodies in the heavens), but in so far as body has within it a nature (that is, the principle of motion). He insists that this is the position of Aristotle (§10) in the *Physics* and *On the Heavens*. As to the subject of Aristotle’s *On the Soul*, he takes it to be animate body (*corpus animatum*). Further echoes of the discussion are still found in the seventeenth century (see John of St Thomas §3).

Another issue in the area of natural philosophy that merits mention is the challenge of Richard Swineshead and the fourteenth-century Oxford Calculators’ tradition of interest in physics (see Oxford Calculators). Central was their doctrine of measuring the intension and remission of forms, that is, physical properties, and stating this measurement in mathematical language. Paul of Venice was one of those who brought this manner of doing natural philosophy to Italy, and he promoted it in his teaching and writings. But it was also taught and fostered at Pavia in the teaching and writings of Giovanni Marliani (d. 1483). Nicoletto Vernia, who spent a year at Pavia, and studied Swineshead’s major work as well as other works in the tradition of the Oxford Calculators, emphatically rejected such an approach to natural philosophy as untrue to Aristotle and Averroes. Agostino Nifo also rejected the approach of the Calculators, insisting that their principles were those of mathematics and were therefore incapable

of providing the basis of a true natural science.

4 Psychology

The background for the discussion of psychology was provided by Aristotle's doctrine in his *On the Soul* of three types of soul, the vegetative, sensitive and intellective, and by his division of the intellect into an active element and passive or receptive element. The Aristotelian tradition would call these two elements the agent intellect and the potential or possible intellect respectively (see Aristotle §19). Some of the Latin medievals also saw Aristotle as maintaining a psychological power of the human soul, identified as the will (*voluntas*). These divisions raised such questions as whether the three souls were separate within the human being, whether the powers of intellect and will were distinct, and whether the agent and possible intellects were distinct either from each other or from the human being. Alexander of Aphrodisias had identified God as the agent intellect. Avicenna held that there was one agent intellect for all human beings, namely the lowest Intelligence, though each had an individual potential intellect (see Alexander of Aphrodisias §2; Ibn Sina §6). In the work on the soul known to the Latin medievals, Averroes held that there was just one separate intellect, but it was composed of both the agent and the potential intellects (see Ibn Rushd §3; Soul in Islamic philosophy, the).

Two particular problems about human cognition deserve mention. The first regards the nature of sensation as presented by the theory of the agent sense, proposed as an analogue of the agent intellect. Inspired by remarks of Averroes, John of Jandun had held that the object of sensation had to be spiritualized by an active power, an agent sense (*sensus agens*), if sensation was to take place. He thought that this agent sense was internal to and multiplied in each human being, though others like Giles of Rome (§3) held it to be a separate substance, that is, an Intelligence. The agent sense was discussed during the fourteenth century by such philosophers as John Buridan (§3), Nicole Oresme, Marsilius of Inghen (§1), and Taddeo of Parma (fl. early fourteenth century). It is also discussed by Blasius (see Blasius of Parma §3), Paul of Venice and Cajetan of Thiene. The latter proposes in a special question on the agent sense that a separate Intelligence provides the spirituality required for the act of sensation to occur. In like fashion, Agostino Nifo (§3) proposes in his own special treatise on the agent sense that God provides the spirituality required for sensation to take place. Cardinal Cajetan, Pietro Pomponazzi, Francesco Silvestri, and later the Jesuit scholastics also take up the question. In his own *Liber de sensu agente (Book on the Agent Sense)* (published 1590), Zabarella pays particular attention to Nifo's theory.

The second particular problem regards the need for intelligible species in the process of intellectual cognition. This need had already been proposed by medievals like Albert the Great, Thomas Aquinas and Duns Scotus (§13). What is involved is a universal representative image (*imago*) or likeness (*similitudo*) that is distinct from the act of intellection itself, yet needed to explain how humans can be united cognitively to external objects. In his explication of the cognitive psychology of Averroes, John of Jandun argued that Averroes had postulated intelligible species in the single possible or potential intellect. This interpretation of Averroes was heatedly debated during the Renaissance by philosophers like Antonio Trombetta (1436-1517) and Marcantonio Zimara, who agreed with Jandun, as well as by Alessandro Achillini (1463-1512) and Agostino Nifo (§3), who denied that Averroes had maintained intelligible species. In an early treatise on intelligible species, Pomponazzi maintained that Averroes had in fact held to such species; he accused Achillini and Nifo of having simply revived an old opinion, namely that of Walter Burley. Pomponazzi considers their opinion stupid and bestial. In fact, although Nifo maintained that neither Aristotle nor Averroes held to intelligible species, he himself takes as true that the human being does need intelligible species in order to think. This he maintains both in his early *De intellectu (On the Intellect)* (1503) and also in his later *De immortalitate animae (On the Immortality of the Soul)* (1518). The doctrine of intelligible species better enabled him to explain the knowledge enjoyed by the disembodied soul after death. In his own treatise on the topic, Zabarella (§§5-6) maintains that the intelligible species is the same thing as the act of thinking and does not remain after death. It is called an intellection if it is related to the intellect in which it exists, but it is called a species or image when it is related to the external thing known.

That intelligible species differ from the act of thinking and are images and likenesses necessary for human thinking was the common doctrine of Jesuit scholasticism. However, concepts as well as intelligible species were postulated, in line with Aquinas' distinction between the intelligible species and the inner word (see Aquinas §10). The need for such intelligible species and concepts was maintained by Franciscus Toletus (§5), the authors of the Coimbra commentaries (see Collegium Conimbricense), and Francisco Suárez (§3). But both Toletus and Suárez

also maintained, in clear opposition to Aquinas, that there are intelligible species and concepts of individuals as opposed to common natures.

The most important question about the intellective soul concerned its relation to the human body. The variously nuanced definitions of the soul that the Renaissance Aristotelians formulated took as their starting point Aristotle's statement in his *On the Soul* that the soul is the first actuality of a body that has life potentially in it (see Aristotle §17). What had been an issue in earlier discussions and continued to be an issue was whether this definition could be read in such a way as to allow a dualistic interpretation. The striking dualism to be found in the thought of Avicenna and the modified dualism that was to be found in the thought of Thomas Aquinas were of course not unknown. But what made the discussions somewhat more complicated was the availability by the end of the fifteenth century of translations of Alexander of Aphrodisias' own *On the Soul*, Themistius' paraphrases of Aristotle's *On the Soul* and the commentary on the same work that was traditionally attributed to Simplicius. Alexander's work presented a view of the soul as resulting from the harmony of bodily parts, while the commentary attributed to Simplicius presented a strikingly dualistic conception of the relation of the soul to the body (see Alexander of Aphrodisias §2).

While those who read Alexander and Simplicius would have found the human soul to be many, that is, one soul for each human being, the interpretation of Averroes was quite different. The theory of the human soul that emerged from Averroes' *Long Commentary on Aristotle's 'On the Soul'* was that each human being had an individual sensitive soul and a set of internal senses that were numerically distinct in each human being. On the other hand, there was numerically only one intellect for the entire human race, and that intellect served as the 'intellective soul' for each human being (see Ibn Rushd §3). Renaissance Aristotelians like Paul of Venice, Apollinaris Offredi (fl. fifteenth century), Johannes Argyropoulos (*c.*1415-87), Nicoletto Vernia, Agostino Nifo, Alessandro Achillini, Marcantonio Zimara, Pietro Trapolin (1451-1506), Marcantonio Genua (d. 1563) and Jacopo Zabarella, expended much of their philosophical and academic energies on explicating the text of Averroes and facing the serious problems that lurk in such a theory of the soul and intellect. In doing so they were in fact following in the footsteps of medievals like Thomas Aquinas, Siger of Brabant, Giles of Rome (§3), John of Jandun and John Baconthorpe among others. It bears noting that in his early thought Pomponazzi took Averroes to present the correct interpretation of Aristotle concerning the human soul. Only later did he attack Averroes, using Aquinas' arguments against Averroes' doctrine of the unity of the intellect.

5 The debate over immortality

The question of whether the personal immortality of the human soul could be demonstrated had already been answered in the negative by such medieval thinkers as Siger of Brabant (§2) (at least in his earlier works), John Duns Scotus, John of Jandun and John Buridan. Soon afterwards, Blasius of Parma (§2) denied the demonstrability of personal immortality. His position reflected the thought of Buridan and Alexander of Aphrodisias. Blasius, who had already stated in questions on Aristotle's *On the Soul* that human cognition has a material basis and is simply a grade of perfection of living matter, reasoned that inasmuch as the human soul has no operation independent from the body, there are no grounds for arguing that the human soul can survive the death of the body. He was reprimanded in 1396 by the Bishop of Pavia for remarks against the Catholic faith and the Church.

A little later, Paul of Venice in his commentary on Aristotle's *On the Soul* stresses, in opposition to Alexander of Aphrodisias, the intellect's ability to reflect upon itself and to know universals. The doctrine of the unity of the intellect that he ascribes to Aristotle he rejects as being counter to moral philosophy, since all rewards for those who are good and all punishments for those who are evil would thereby be destroyed. The view that virtue is its own reward and vice its own punishment he rejects as inadequate. And in his commentary on Aristotle's *On Generation and Corruption* he argues for personal immortality on the grounds that there is a natural desire in each human to enjoy a perpetual beatitude. Subsequently Agostino Nifo (§3) presented similar moral arguments for personal immortality in his early work *De intellectu (On the Intellect)* (1503).

Cajetan of Thiene, who succeeded Paul of Venice as the major professor at Padua, believed that Averroes' doctrine of the unity of the intellect could in fact be disproven by human reason and that probative arguments for personal immortality could be given. Johannes Argyropoulos, who had studied with Cajetan of Thiene, also offered arguments for personal immortality. In contrast, Nicoletto Vernia (§4), who succeeded to Cajetan of Thiene's chair at Padua, was a strict follower of Averroes regarding the unity of the intellect in an early treatise on the intellective

soul; in it, he denied that personal immortality could be demonstrated. In like fashion, Vernia's student, Agostino Nifo, stated in his earliest works that Averroes was the correct interpreter of Aristotle regarding the soul and intellect, and that personal immortality could not be demonstrated. However, a new set of factors dramatically changed the course of discussions regarding immortality, and both Vernia and Nifo came to hold that personal immortality could be demonstrated. These factors were the publication in 1481 of Ermolao Barbaro's Latin translation of Themistius' paraphrases on Aristotle's *On the Soul*, the publication in 1495 of Girolamo Donato's translation of Alexander of Aphrodisias' *On the Soul*, and the circulation of a now lost translation of the commentary on Aristotle's *On the Soul* attributed to Simplicius. These works, made available by the humanists, allowed philosophers to study the conflicting conceptions of the soul as subsistent and independent of the body and of the soul as the product of the harmony of the body. Vernia and Nifo fought over the correct interpretation of Alexander, since Vernia seemed unwilling to admit that Alexander denied personal immortality. Others like Giovanni Pico della Mirandola would also maintain the same mistaken interpretation of Alexander.

Both Vernia and Nifo later turned away from Averroes as the true interpreter of Aristotle regarding the soul and intellect and came to accept Themistius and Simplicius as truer guides. Pomponazzi too followed a similar path. He regarded Averroes as the true interpreter of Aristotle in his early questions on the soul and intellect, though he does also cite Alexander from Donato's translation. Eventually in his *De immortalitate animae* (1516) Pomponazzi (§2) uses arguments from Thomas Aquinas to discredit Averroes and his doctrine of the unity of the intellect, though he goes on to marshal arguments from Alexander to discredit Aquinas' attempt to demonstrate the intellective soul's independence of the body. He rejects moral arguments for immortality and retorts that virtue and vice are their own reward and punishment. It is noteworthy that there was a similar shift in the thought of the Dominican Cardinal Cajetan (§4) from acceptance of the demonstrability of personal immortality to a denial that such arguments have probative force. By this denial he was of course breaking with Thomas Aquinas, his intellectual master. Oddly enough, Antonio Trombetta, the major Franciscan theologian at Padua towards the end of the fifteenth century, did not follow his own master, Duns Scotus, on the question but held that immortality could be demonstrated.

Throughout the sixteenth century the possibility of demonstrating the immortality of the human soul continued to be debated. Simone Porzio (1496-1554), in his *De humana mente disputatio (On the Human Mind)* (first published in 1551), taught that the coming-to-be and passing-away of humans is not different from that of the animals. The intellect is inseparable from the body and can be considered to be material. Jacopo Zabarella clearly states in his commentary on Aristotle's *On the Soul* that according to true philosophy the human soul is a form giving existence to matter and yet separable and immortal, since it is not educed from the potency of matter but created by God. This view agrees with the Christian religion and with truth, but it is not the position of the philosophy of Aristotle. Indeed Zabarella notes in his own *Liber de mente humana (On the Human Mind)* (published in 1590) that it is doubtful that Aristotle knew of such a creation. Although he judges Pomponazzi to have come closest to the mind of Aristotle, he criticizes his views on what Aristotle meant by stating that the intellect comes from outside. On the other hand, Francesco Piccolomini (1520-1604) maintained that Aristotle considered the human soul to be immortal despite the contrary interpretation of others like Pomponazzi and Cardinal Cajetan. He takes Aristotle to have held that the human soul is not the form of the body but is related to the body as its actuality in the manner in which a sailor is the actuality of a ship. Finally it should be emphasized that Jesuit scholastics like Franciscus Toletus (§5) and Francisco Suárez (§3) offered rational arguments for the immortality of the soul (see Soul, nature and immortality of the).

6 Metaphysics

Various metaphysical topics debated during the Middle Ages continued to be of interest during the Renaissance. The nature of the distinction between essence and existence that divided Aquinas (§10) and Duns Scotus (§6) was studied by their Renaissance followers (see Báñez, D.; Cajetan §5; Fonseca, P. da §3; Nifo, A. §4; Suárez, F. §2), and whether being involved a univocal or an analogous concept was also debated (see Language, Renaissance philosophy of §4; Capreolus, J.; Cajetan §2; Fonseca, P. da §3; Silvestri, F.). The Dominican Paolo Barbo Soncinas (d. 1494) discussed analogy and the distinction of essence and existence. Trombetta and Maurice O'Fihely (1463-1514), both Franciscans, defended Scotus' views on the formal distinction and the univocal concept of being (see Duns Scotus §5). Cardinal Cajetan wrote a commentary on Aquinas' treatise *De ente et essentia (On Being and Essence)* and also claimed to set forth Aquinas' views in his own treatise *De Nominum*

Analogia (On the Analogy of Names) (1498). How close his thought is to Aquinas himself has been questioned. Achillini and Nifo both discussed the transcendentals, as did the Dominican Crisostomo Javelli (1470-1538) who defended Aquinas' views. Various Aristotelian thinkers like Elijah Delmedigo, Cajetan, Trombetta and Nifo all debated whether human reason could prove God's power to be infinite. Zimara, Delmedigo and Nifo also attempted to establish the mode of causality enjoyed by God and the Intelligences according to Aristotle and Averroes. Yet another topic of interest was whether according to reason and philosophy there could be a direct cognitive 'conjunction' of the human being with God and the Intelligences. This topic was inspired by Averroes and had already been discussed by medievals like Albert, Aquinas and John of Jandun. Nifo treated it seriously; Pomponazzi mocked it.

One of the most interesting developments to take place in Renaissance Aristotelianism concerned a conceptual scheme of metaphysical hierarchy first elaborated at the end of the thirteenth century. Albert the Great and Thomas Aquinas had spelled out this scheme, basing themselves on Proclus and Pseudo-Dionysius the Areopagite. God and nothingness (or matter) serve as two measures for the hierarchy of being. As a being 'approaches' God and 'recedes' from nonbeing, it holds an accordingly higher grade in the hierarchy. The scheme was also adopted with variations by Siger of Brabant (§4), Giles of Rome (§2), Henry of Ghent (§2), Godfrey of Fontaines (§3) and James of Viterbo. However, during the fourteenth century and thereafter it was challenged on the grounds that if God always remains at an 'infinite distance' from all creatures then no creature would be any closer to God than any other, and there would be no hierarchy of being.

One solution to this dilemma was to borrow from Richard Swineshead and the Oxford Calculators, who measured physical qualities like heat only from the lowest or zero grade (see Oxford Calculators). This route was pursued by Paul of Venice, who appears to be the target of Marsilio Ficino's attack on 'barbarians' (*barbari*) who do not take God as a measure of the hierarchy of being and settle on nonbeing alone (see Ficino, M.). A similar attack was mounted by Pomponazzi, who dismisses Swineshead's views and insists that the Aristotelian position is to measure things by the highest grade. On this topic Pomponazzi is anything but a 'radical philosopher'.

A major statement of the conceptual scheme of hierarchy as elaborated by Albert and Aquinas was given by Agostino Nifo, who attributed both the scheme and also a metaphysics of participation to Averroes. Marcantonio Zimara also attributed the scheme and a metaphysics of participation to Averroes. Other contemporaries who interested themselves in the scheme include Gabriele Zerbo (1435-1535), Trombetta, Cardinal Domenico Grimani (1461-1523), Achillini, the young Thomas de Vio (who was to become Cardinal Cajetan), Crisostomo Javelli and Gaspare Contarini (1483-1542). Later philosophers who examined and accepted the scheme include Francesco Buonamici (*c.*1540-1603) and Iacopo Mazzoni (1548-98). They were respectively the teacher and the colleague of Galileo Galilei at Pisa. Galileo himself presented arguments in his *juvenilia* against taking God as a measure of things (see Galilei, Galileo). The scheme was also rejected by Cesare Cremonini (1550-1631), Galileo's contemporary at Padua. One solution to the problem of how an infinite God could serve as a measure was to take God as finite. Achillini, Contarini and Buonamici accepted this solution.

7 Ethics and political philosophy

Aristotle's ethical writings interested and influenced a wide range of thinkers throughout the fifteenth and sixteenth centuries, from humanist authors such as Leonardo Bruni (1370-1444) to scholastic writers such as Francisco Suárez. Indeed the fifteenth century saw the diffusion of Aristotle's ethical thought to a new audience that was characterized by the concerns that cluster under the term 'humanism'. Bruni's approval of Aristotle marked the beginning of a new view, one that stressed Aristotle as a guide in rhetoric and moral philosophy and showed little interest in his views on logical, physical, psychological or metaphysical questions. Bruni thereby provided the inspiration for intellectuals who were not professional philosophers to use Aristotle as a guide to practical life and avoid more technical philosophical issues (see Humanism, Renaissance §§5, 7; Platonism, Renaissance §§1, 4).

At the beginning of the fifteenth century, the extant translations of Aristotle's *Nicomachean Ethics* were literal, technical and frequently relied on transliteration. To those taught according to humanist ideals, such translations were uninviting. Under the influence of Cicero and his own teacher Manuel Chrysoloras, Bruni developed a theory of translation unlike the typical medieval method. The sense of the Greek passage had to be understood and then translated according to the best models of Latin prose. Bruni claimed the translations used by scholastic

philosophers led them to misunderstand Aristotle even on minor points. He himself completed translations of the *Nicomachean Ethics* and the *Politics*, as well as the pseudo-Aristotelian *Economics*. His translation of the *Nicomachean Ethics* was hugely successful. He also wrote two works that reflect Aristotelian influence, namely an *Isagogicon moralis philosophiae (Introduction to Moral Philosophy)* (published between 1424 and 1426) and a *Vita Aristotelis (Life of Aristotle)* (published in 1428 or 1429). In the latter, Bruni takes Plato to task on several fronts, notably for his faulty methodology and for his views on such matters as the holding of wives and property in common.

The medieval Aristotelian tradition of political thought that was of Thomistic inspiration was passed on to Italy through two Florentine Dominicans who studied in Paris, namely Ptolemy of Lucca (*c.*1236-1327) and Remigio de'Girolami (1235-1319). Ptolemy had studied with Aquinas and wrote the continuation of Aquinas' *De regno (On Kingship)*, known also as *De regimine principum (On the Rule of Princes)*. Although Aquinas accorded primacy to monarchy, Ptolemy took Aristotle to prefer republican or elective rule regulated by law. Political rule is simply rule in accordance with written laws, while royal or despotic rule ignores law. Since the stars influence humans, some provinces are fit for liberty and others for servitude. The city-states of Northern Italy are suitable for political rule, since men there are self-confident and virile, like the ancient Romans. In contrast, the inhabitants of Sicily, Sardinia and Corsica are servile and therefore should have royal rule. Remigio attempted to conciliate Aristotle and Augustine, and also favoured Cicero as an authority and Ancient Rome as a model. In his *De bono communi (On the Common Good)* (written in 1302 or 1303), he discerned inordinate self-love as the cause of widespread discord; in his *De bono pacis (On the Good of Peace)* (written in 1304) he justified the ruler confiscating some individual's possessions for the greater good of the city.

Two Renaissance Dominicans need to be mentioned. Girolamo Savonarola (1452-98) wrote an early compendium of philosophy based on Aristotle and Aquinas that also reflects the thought of Ptolemy of Lucca (see Scepticism, Renaissance §3). Indeed his later treatise on governing Florence is a defence of republicanism dependent on Ptolemy's ideas in *De regimine principum*. He argues that since Florentines are vital and intelligent, their habit is to have civil rule. In the republicanism that he sets forth, he stresses the central role of a Great Council patterned on that of Venice. Another famed Dominican, Tommaso Campanella (§3), had a less favourable view of Aristotle. He noted that Aristotle denied that artisans, farmers and merchants could be citizens, since they lacked the virtues necessary to be either citizens or rulers. This would mean that only the nobles in Venice could be citizens: in fact they are tyrants, since other humans are thereby made their slaves and enemies. Consequently Aristotle's state is contrary to nature.

A more positive evaluation of Aristotle and the Venetian republic emerges from Francesco Piccolomini's *Universa philosophia de moribus (Universal Philosophy Concerning Ethical Matters)* (completed and published in 1583). He praises individual Venetians for their virtue and also the education offered young Venetian nobles at the University of Padua preparing them for service to Venice; nobles are more suited to be led to virtue. He also discusses at length how Venice is a mixed constitution and boldly claims that of all republics it approximates most closely to the republic that is ruled by God: the City of God.

Following Aristotle, Piccolomini takes ethics and political philosophy to be parts of one science. Whereas the subject of the *Nicomachean Ethics* involves human actions as they render humans good, the subject of the *Politics* is human actions as public good arises from them, namely the forming and the preserving of republics. The five grades of virtue are the natural, moral or civil, rational, heroic, and divine. Each represents a step towards becoming like God, the purpose of virtue. For Aristotle, human happiness is found primarily in contemplation and secondarily in moral goodness, while human virtue is found primarily in wisdom and only secondarily in moral virtue. Piccolomini rejects as against Aristotle the view of Averroes and Avicenna that the highest good in this life is a cognitive union with a separate intellect.

Piccolomini emphasizes the limits of Aristotle's ethics, noting that he knew neither another life nor union with God. Theologians know from divine revelation that the highest good of such a union is available only in the next life, but it is open to humans of every age and social class. In contrast, the highest good of Aristotle is available only in this life, and is not open to children, slaves, women and the poor. Aristotle's moral virtue forms one into an upright human being, citizen and ruler, but the theologian's infused or divine virtues of faith, hope and charity form one into a Christian and a citizen of heaven. And yet Piccolomini declares the Love Command of the Gospels

to be demanded by natural law.

Aristotle (384-322 BC)

Aristotle of Stagira is one of the two most important philosophers of the ancient world, and one of the four or five most important of any time or place. He was not an Athenian, but he spent most of his life as a student and teacher of philosophy in Athens. For twenty years he was a member of Plato's Academy; later he set up his own philosophical school, the Lyceum. During his lifetime he published philosophical dialogues, of which only fragments now survive. The 'Aristotelian corpus' (1462 pages of Greek text, including some spurious works) is probably derived from the lectures that he gave in the Lyceum.

Aristotle is the founder not only of philosophy as a discipline with distinct areas or branches, but, still more generally, of the conception of intellectual inquiry as falling into distinct disciplines. He insists, for instance, that the standards of proof and evidence for deductive logic and mathematics should not be applied to the study of nature, and that neither of these disciplines should be taken as a proper model for moral and political inquiry. He distinguishes philosophical reflection on a discipline from the practice of the discipline itself. The corpus contains contributions to many different disciplines, not only to philosophy.

Some areas of inquiry in which Aristotle makes a fundamental contribution are these:

(1) Logic. Aristotle's Prior Analytics *constitutes the first attempt to formulate a system of deductive formal logic, based on the theory of the 'syllogism'. The* Posterior Analytics *uses this system to formulate an account of rigorous scientific knowledge. 'Logic', as Aristotle conceives it, also includes the study of language, meaning and their relation to non-linguistic reality; hence it includes many topics that might now be assigned to philosophy of language or philosophical logic (*Categories*,* De Interpretatione*,* Topics*).*

(2) The study of nature. About a quarter of the corpus (see especially the History of Animals*,* Parts of Animals*, and* Generation of Animals*; also* Movement of Animals*,* Progression of Animals*) consists of works concerned with biology. Some of these contain collections of detailed observations. (The* Meteorology *contains a similar collection on inanimate nature.) Others try to explain these observations in the light of the explanatory scheme that Aristotle defends in his more theoretical reflections on the study of nature. These reflections (especially in the* Physics *and in* Generation and Corruption*) develop an account of nature, form, matter, cause and change that expresses Aristotle's views about the understanding and explanation of natural organisms and their behaviour. Natural philosophy and cosmology are combined in* On the Heavens*.*

(3) Metaphysics. In his reflections on the foundations and presuppositions of other disciplines, Aristotle describes a universal 'science of being qua *being', the concern of the* Metaphysics*. Part of this universal science examines the foundations of inquiry into nature. Aristotle formulates his doctrine of substance, which he explains through the connected contrasts between form and matter, and between potentiality and actuality. One of his aims is to describe the distinctive and irreducible character of living organisms. Another aim of the universal science is to use his examination of substance to give an account of divine substance, the ultimate principle of the cosmic order.*

(4) Philosophy of mind. The doctrine of form and matter is used to explain the relation of soul and body, and the different types of soul found in different types of living creatures. In Aristotle's view, the soul is the form of a living body. He examines the different aspects of this form in plants, non-rational animals and human beings, by describing nutrition, perception, thought and desire. His discussion (in On the Soul*, and also in the* Parva Naturalia*) ranges over topics in philosophy of mind, psychology, physiology, epistemology and theory of action.*

*(5) Ethics and politics (*Nicomachean Ethics*,* Eudemian Ethics*,* Magna Moralia*). In Aristotle's view, the understanding of the natural and essential aims of human agents is the right basis for a grasp of principles guiding moral and political practice. These principles are expressed in his account of human wellbeing, and of the different virtues that constitute a good person and promote wellbeing. The description of a society that embodies these virtues in individual and social life is a task for the* Politics*, which also examines the virtues and vices of actual states and societies, measuring them against the principles derived from ethical theory.*

*(6) Literary criticism and rhetorical theory (*Poetics*,* Rhetoric*). These works are closely connected both to Aristotle's logic and to his ethical and political theory.*

1 Life

Aristotle was born in 384 BC, in the Macedonian city of Stagira, now part of northern Greece. In his lifetime the kingdom of Macedon, first under Philip and then under Philip's son Alexander ('the Great'), conquered both the Greek cities of Europe and Asia and the Persian Empire. Although Aristotle spent much of his adult life in Athens, he was not an Athenian citizen. He was closely linked to the kings of Macedon, whom many Greeks regarded as foreign invaders; hence, he was affected by the volatile relations between Macedon and the Greek cities, especially Athens.

Aristotle was the son of Nicomachus, a doctor attached to the Macedonian court. In 367 BC Aristotle came to Athens. He belonged to Plato's Academy until the death of Plato in 347; during these years Plato wrote his important later dialogues (including the *Sophist*, *Timaeus*, *Philebus*, *Statesman*, and *Laws*), which reconsider many of the doctrines of his earlier dialogues and pursue new lines of thought. Since there was no dogmatic system of 'Platonism', Aristotle was neither a disciple of such a system nor a rebel against it. The exploratory and critical outlook of the Academy probably encouraged Aristotle's own philosophical growth.

In 347 BC Aristotle left Athens, for Assos in Asia Minor. Later he moved to Lesbos, in the eastern Aegean, and then to Macedon, where he was a tutor of Alexander. In 334 he returned to Athens and founded his own school, the Lyceum. In 323 Alexander died; in the resulting outbreak of anti-Macedonian feeling in Athens Aristotle left for Chalcis, on the island of Euboea, where he died in 322.

Aristotle married Pythias, a niece of Hermeias, the ruler of Assos. They had a daughter, also called Pythias. After the death of his wife, Aristotle formed an attachment to Herpyllis, and they had a son Nicomachus.

2 Order of Aristotle's works

By the end of Aristotle's life the Lyceum must have become a well-established school. It lasted after Aristotle's death; his successor as head of the school was his pupil Theophrastus. Many of the works in the Aristotelian corpus appear to be closely related to Aristotle's lectures in the Lyceum. The polished character of some passages suggests preparation for publication (for example, *Parts of Animals* I 5), but many passages contain incomplete sentences and compressed allusions, suggesting notes that a lecturer might expand (for example, *Metaphysics* VII 13). We cannot tell how many of his treatises Aristotle regarded as 'finished' (see §11 on the *Metaphysics* and §21 on the *Ethics*).

It may be wrong, therefore, to ask about the 'date' of a particular treatise. If Aristotle neither published nor intended to publish the treatises, a given treatise may easily contain contributions from different dates. For similar reasons, we cannot plausibly take cross-references from one work to another as evidence of the order of the works. External, biographical considerations are unhelpful, since we lack the evidence to support any detailed intellectual biography of Aristotle.

A few points, however, may suggest a partial chronology.

(1) Some of Aristotle's frequent critical discussions of Plato and other Academics may have been written (in some version) during Aristotle's years in the Academy. The *Topics* may reflect the character of dialectical debates in the Academy.

(2) It is easier to understand the relation of the doctrine of substance in the *Categories* and *Physics* I-II to the doctrine and argument of *Metaphysics* VII if we suppose that *Metaphysics* VII is later.

(3) The Organon (see §4) does not mention matter, perhaps because (a) Aristotle had not yet thought of it, or because (b) he regarded it as irrelevant to the topics considered in the Organon. If (a) is correct, the Organon precedes the works on natural philosophy.

(4) Some of the observations used in Aristotle's biological works probably came from the eastern Aegean. Hence, Aristotle probably pursued his biological research during his years away from Athens. We might trace his biological interests to the Academy (see Plato's *Timaeus*); he may also have acquired them from his father Nicomachus, who was a doctor. Probably, then, at least some of the biological works (or versions of them) are not the latest works in the corpus.

(5) The *Magna Moralia* (if it is genuine) and the *Eudemian Ethics* probably precede the *Nicomachean Ethics* (see §21).

The order in which Aristotle's works appear in the Greek manuscripts goes back to early editors and commentators (from the first century BC to the sixth century AD); it reflects their view not about the order in which the works were written, but about the order in which they should be studied. This entry generally follows the order of the corpus, except that it discusses *On the Soul* after the *Metaphysics* (see §17), not among the works on natural philosophy (where it appears in the manuscripts).

3 Appearances

The general aim of rational inquiry, according to Aristotle, is to advance from what is 'better known to us' to what is 'better known by nature' (see *Physics* I 1; *Posterior Analytics* 71b33; *Metaphysics* 1029b3). We achieve this aim if: (1) we replace propositions that we thought we knew with propositions that we really know because they are true and we understand them; (2) we find general principles that explain and justify the more specific truths that we began from; (3) we find those aspects of reality that explain the aspects that are more familiar to us.

The things better known to us in a particular area are the relevant 'appearances' (*phainomena*). Aristotle presents them through detailed collections of empirical data, reached as a result of 'inquiry' (*historia*; for example, *Parts of Animals* 646a8). Empirical inquiry proceeds from particular observations, by means of generalizations through induction (*epagōgē*) from these particular cases, until we reach experience (*empeiria*). Experience leads us to principles that are better known by nature (*Prior Analytics* 46a17); we also rely on it to test principles we have found (*Generation of Animals* 760b28).

Philosophical inquiry also relies on 'appearances'. However, the appearances that concern it are not empirical observations, but common beliefs, assumptions widely shared by 'the many and the wise'. The critical and constructive study of these common beliefs is 'dialectic'. Aristotle's method is basically Socratic. He raises puzzles in the common beliefs, looking for an account that will do them justice as a whole. Among common beliefs Aristotle considers the views of his predecessors (for example, *Metaphysics* I; *On the Soul* I; *Politics* II), because the puzzles raised by their views help us to find better solutions than they found.

Inquiry leads us to causes and to universals. Aristotle has a realist conception of inquiry and knowledge; beliefs and theories are true in so far as they grasp the reality that we inquire into (see Realism and antirealism §2). Universals and causes are 'prior by nature'; they are not created by, or dependent on, any theory, but a true theory must fit them.

If we attended only to Aristotle's remarks on what is better known to us and on the process of inquiry, we might regard his position as a form of empiricism (see Empiricism). But in his remarks on what is better known by nature, he insists on the reality of universals and on the importance of non-sensory forms of knowledge (see §15 on universals, §19 on thought).

4 Thought and language

One means of access to appearances, and especially to common beliefs, is the study of what words and sentences 'signify' (*sēmainein*). This is part of 'logic' (*logikē*, derived from *logos*, which may be translated 'word', 'speech', 'statement', 'argument' or 'reason': see Logos), which is discussed in the first section of Aristotle's works (*Categories*, *De Interpretatione*, *Prior Analytics*, *Posterior Analytics*, *Topics*). This section of the corpus came to be called the 'Organon' ('instrument'), because logic, as Aristotle conceives it, concerns statements and arguments in general, without restriction to any specific subject matter; it is therefore an instrument of philosophical inquiry in general, rather than a branch of philosophy coordinate with natural philosophy or ethics. The Organon includes some elements of philosophy of language, as well as formal logic (syllogistic; see §5) and epistemology (see §6).

According to Aristotle's account of signification (see especially *De Interpretatione* 1-4), as commonly understood, the word 'horse' signifies horse by signifying the thought of horse; in using the word, we communicate thoughts about horses. When the thoughts about horses we communicate are true, we communicate truths about the universal horse; even when our thoughts are not completely true, we may signify the same universal horse.

To understand the signification of a name '*F*', we look for the corresponding definition (*logos*, *horismos*) of *F*.

Aristotle distinguishes nominal definitions, stating the beliefs associated with the name, from real definitions, giving a true account of the universal that underlies the beliefs embodied in the nominal definition (see *Posterior Analytics* II 8-10. Aristotle himself does not use the labels 'nominal definition' and 'real definition'.).

Not every name corresponds to one nominal and one real definition. Some names correspond to no genuine universal; 'goatstag' signifies (in one way) animals that are both goats and stags, but it does not signify a genuine universal, since there is no natural kind of goatstag. Other names correspond to more than one universal, as 'chest' signifies both a container and a part of an animal. Chests are 'homonymous' (*homōnyma*) or 'multivocal' (*pollachōs legomena*; 'spoken of in many ways'); more than one definition is needed to capture the signification of the name. By contrast, since only one definition corresponds to the name 'horse', horses are 'synonymous' (*Categories* 1).

Other philosophers make serious errors, Aristotle believes, because they suppose they can give a single account of things or properties that are really multivocal. Once we see that different *F*s are *F* in different ways, we see that different, although (in many cases) connected, accounts of what it is to be *F* must be given. Some philosophically important cases of multivocity are cause (Aristotle's doctrine of the four causes; see §9), being (the doctrine of the categories; see §7) and good (the criticism of Plato's belief in a Form of the Good; *Nicomachean Ethics* I 6).

5 Deduction

Part of logic, as Aristotle conceives it, is the study of good and bad arguments. In the *Topics* Aristotle treats dialectical arguments in general. In the *Prior Analytics* he examines one type of argument, a 'deduction' (*syllogismos*; literally, 'reasoning', hence the standard term 'syllogism'). This is an argument in which, if propositions *p* and *q* are assumed, something else *r*, different from *p* and *q*, follows necessarily because of the truth of *p* and *q* (*Prior Analytics* 24b18-20, paraphrased). Aristotle insists that it is not possible for the premises of a deduction to be true and the conclusion false ('follows necessarily'); that a deduction must have more than one premise ('if *p* and *q* are assumed'); that the conclusion cannot be identical to any premise ('different from *p* and *q*'); and that no redundant premises are allowed ('because of the truth of *p* and *q*'). He takes deductions to express affirmative or negative relations between universals, taken either universally ('Animal belongs to every (no) man') or not universally ('Animal belongs (does not belong) to some man'). He takes the affirmative and negative claims to imply existence (so that 'Biped belongs to some dodo' follows from 'Biped belongs to every dodo'; the latter affirmation is not equivalent, therefore, to 'If anything is a dodo, it is biped').

These different features of an Aristotelian deduction differentiate Aristotle's account of a deduction from a more familiar account of deductively valid arguments. An argument may be valid even if it is redundant, or a premise is identical to the conclusion, or it has only one premise, or it is about particulars, or it contains neither 'some' nor 'every' nor 'belongs'; but no such argument is an Aristotelian deduction. Aristotle's theory of the different forms of deduction (often called 'the moods of the syllogism') examines the various forms of argument that necessarily preserve the truth of their premises. He begins from 'complete' (or 'perfect') deductions whose validity is evident, and classifies the different types of arguments that can be derived from (shown to be equivalent to) the complete deductions. He also explores the logical relations between propositions involving modalities ('Necessarily (possibly) animal belongs to every man' and so on). Since Aristotle accepts this relatively narrow account of a deduction, his exploration of the different forms of deduction is not a theory of valid arguments in general; the Stoics come much closer to offering such a theory (see Stoicism §11; Logic, ancient).

Aristotle's theory of deduction is developed for its own sake, but it also has two main philosophical applications. (1) Deduction is one type of argument appropriate to dialectic (and, with modifications, to rhetoric; see §29). Aristotle contrasts it with inductive argument (also used in dialectic), in which the conclusion does not follow necessarily from the premises, but is made plausible by them. (2) It is essential for demonstration (*apodeixis*), which Aristotle takes to be the appropriate form for exhibiting scientific knowledge.

6 Knowledge, science and demonstration

The progress from what is known to us to what is known by nature aims at *epistēmē*, the scientific knowledge whose structure is exhibited in the demonstrative pattern described in the *Posterior Analytics*. A demonstration is a deduction in which the premises are necessarily true, prior to and better known than the conclusions, and

explanatory of the conclusions derived from them. Aristotle assumes that if I know that *p*, then I can cite some justification *q*, to justify my belief that *p*, and I also know why *q* justifies *p* (*Posterior Analytics* I 2). The right sort of justification relies on things better known by nature - the general laws and principles that explain the truth of *p*. Since these are embodied in demonstrations, grasp of a demonstration of *p* expresses knowledge of *p*. Aristotle's theory of demonstration, then, is not intended to describe a procedure of scientific inquiry that begins from appearances; it is an account of the knowledge that is achieved by successful inquiry.

To show that a deduction is a demonstration, we must show that its premises are better known than the conclusion. Sometimes we can show this by demonstrating them from higher premises that are even better known. This process of justification, Aristotle claims, must be linear and finite. A circular 'justification' must eventually 'justify' a given belief by appeal to itself, and an infinite regress imposes on us a task that we can never complete. Since, therefore, neither a circle nor an infinite regress can really justify, a proper justification must ultimately appeal to primary principles of a science.

These primary principles are 'assumptions' (*hypotheseis*); we must see that they are better known and prior to other truths of a science, without being derived from any further principles. Since they are the basis of all demonstration, they cannot themselves be demonstrated; Aristotle claims that we have non-demonstrative understanding (*nous*: *Posterior Analytics* II 19) of the ultimate principles of each science (see Nous).

How are we entitled to claim understanding of an ultimate principle? Aristotle believes that the principles of a science are reached from appearances (perceptual or dialectical or both), which are the starting points known to us. He may believe that this relation of the principles to appearances justifies us in accepting them as first principles and in claiming to have understanding of them. This explanation, however, does not easily fit Aristotle's demand for linear and finite chains of justification. That demand suggests that the assumptions of a science must be self-evident (seen to be true without any inferential justification), so that his conception of knowledge expresses a foundationalist position (see Foundationalism §3). (On difficulties in foundationalism see Agrippa.)

Although Aristotle's aim of reaching a demonstrative science reveals some of his epistemological doctrines and assumptions, it does not evidently influence most of the structure or content of most of the surviving treatises. In his main philosophical works, the influence of dialectical methods and aims is more apparent.

7 Categories and beings

Part of the task of logic is to explain the nature of predication ('*A* is *B*', analysed by Aristotle as '*B* is predicated of *A*' or '*B* belongs to *A*', as in 'Animal belongs to every man'), which is presupposed by complex *logoi* (statements and arguments). In the *Categories* (*katēgoriai*; predications), Aristotle introduces ten 'categories' (usually called *schēmata tēs katēgorias*, 'figures (that is, types) of predication'). The categories correspond to different sorts of words (for example, count-nouns, adjectives, verbs) and to different grammatical functions (for example, subject, predicate), but they primarily classify the different non-linguistic items introduced in predications. The sentences 'Socrates is a man' and 'Socrates is a musician' are grammatically similar, but they introduce different sorts of things; the first predicates a second substance of a first substance, whereas the second predicates a non-substance of a first substance.

The first category is called *ousia* (literally, 'being'), which is translated into Latin as 'substantia', and hence usually called 'substance' (see Substance §1). The nine non-substance categories include quality, quantity and relative (the only ones that Aristotle refers to often; the categories are listed in *Categories* 4, *Topics* I 9). Each category contains both particulars and universals. The statement that this individual man is an animal predicates a second substance (that is, a universal in the category of substance) of a first substance (that is, a particular in the category of substance). 'White is a colour' predicates one universal quality of another.

The categories display the multivocity of beings (see §4). Whereas animals constitute an ordinary univocal genus with a single definition, beings do not constitute an ordinary genus; hence there is no single account of what it is for something to be a being. Aristotle believes Plato mistakenly pursued a single account of beings; the theory of categories is meant to avoid Platonic errors.

In marking categorial divisions, Aristotle is influenced by grammar and syntax, but also by his ontology - his classification of beings. This classification rests on his view of nature and change, which clarifies his analysis of

predication.

8 Change and substance

Aristotle's *Physics* discusses nature, *physis*. The nature of *x* is a principle (or 'source'; *archē*), internal to *x*, of change and stability in *x*; hence the inquiry into nature leads to a discussion of change in natural substances (the elements, plants and animals). Aristotle proceeds dialectically, raising and solving puzzles involved in the understanding of natural change. In solving the puzzles, he introduces the different types of beings that are presupposed by a coherent account of natural change.

In *Physics* I 7-8, Aristotle analyses a simple example of change - Socrates changing from being pale to being tanned. This change involves a subject (or 'underlying thing'; *hypokeimenon*), Socrates, who loses one contrary (his pale colour) and acquires another contrary (his tan). Neither of the contraries persists, but the subject persists (otherwise there would not be a change in Socrates). This particular subject that persists through change is what the *Categories* calls a first substance. First substances differ both from second substances and from non-substances by being capable of undergoing change; they persist while receiving opposites (as Socrates is first pale and then tanned). They cannot, however, remain in existence irrespective of any properties gained or lost; Socrates' ceasing to be a man is not a change in Socrates, but the perishing of Socrates.

The properties that a first substance cannot lose without perishing constitute (approximately) the essence of that first substance (see Essentialism). These essential properties define a kind to which the first substance belongs. A kind may be a species (*eidos*), for example, man or horse, or a genus (*genos*), for example, animal. In predicating a second substance of a first substance (as in 'Socrates is a man'), we place the first substance in the kind it belongs to. If we predicate one of the contraries that the first substance can lose without perishing, we introduce an item (Socrates' pale colour, his particular height, his ignorance, his being the husband of Xanthippe) in one of the non-substance categories (quality, quantity, relative, and so on). The kinds to which these non-substantial items belong are non-substantial universals.

Aristotle also examines the coming to be and perishing of a first substance. Here again, he distinguishes a persisting subject and two contraries. If we make a statue from bronze, the lump of bronze (the subject) acquires the shape of the statue, and loses the shapelessness it had, and so changes between contraries. But although the lump remains in existence, a new subject, the statue, has come into being. In this case, the subject of the change is the matter (*hylē*), and what it acquires is the form (*eidos*, also rendered 'species').

This analysis of change suggests an argument (*Physics* II 1) to show that the genuine subject, and hence the genuine substance, is the matter, whereas the apparent substance (for example, the statue) is simply matter with a certain shape. Socrates does not become another subject if he changes shape; hence (we may argue) the lump of bronze does not become another subject simply by acquiring the shape of a statue. Similarly, then, a natural organism might be understood as a piece of matter shaped in a certain way so as to embody Socrates. Natural organic 'substances', such as Socrates and this tree, turn out to be not genuine subjects, but mere configurations of the matter that is the real substance.

Aristotle does not endorse this eliminative attitude to natural organic substances. He uses the argument to raise a puzzle about whether matter or form is substance. He discusses this puzzle in *Metaphysics* VII (see §12-14). This discussion relies on his account of causation and explanation.

9 Causes

When we correctly answer questions such as 'Why does this event happen?' or 'Why is this object as it is?', we state the cause (or explanation; *aition*) of the event or object. Aristotle believes that causes are multivocal (see *Physics* II 3; *Metaphysics* I 3). Different accounts of a cause correspond to different answers to why-questions about (for example) a statue. (1) 'It is made of bronze' states the material cause. (2) 'It is a statue representing Pericles' states the formal cause, by stating the definition that says what the thing is. (3) 'A sculptor made it' states the 'source of change', by mentioning the source of the process that brought the statue into being; later writers call this the 'moving cause' or 'efficient cause'. (4) 'It is made to represent Pericles' states 'that for the sake of which', since it mentions the goal or end for the sake of which the statue was made; this is often called the 'final' (Latin *finis*; 'end') cause.

Each of the four causes answers a why-question. Sometimes (as in our example) a complete answer requires all four causes. Not all four, however, are always appropriate; the (universal) triangle, for example, has a formal cause, stating its definition, but no efficient cause, since it does not come into being, and no final cause, since it is not made to promote any goal or end.

Some have claimed that Aristotle's 'four causes' are not really causes at all, pointing out that he takes an *aition* to be available even in cases where the why-question (for example, 'Why do the interior angles of this figure add up to two right angles?') does not seek what we would call a cause (in Aristotle's division, an efficient cause). When explanations of changes are being sought, however, Aristotle seems to provide recognizably causal explanations. Even the *aitia* (material, formal, final) that do not initially seem to be causes turn out to play an important role in causal explanation; for this reason, the label 'four causes' gives a reasonably accurate impression of Aristotle's doctrine.

His comparison between artefacts and natural organisms clarifies his claims about formal and final causes. The definition of an artefact requires reference to the goal and the intended function. A hammer's form and essence is a capacity to hammer nails into wood. The hammer was designed to have this capacity for performing this function; and if this had not been its function, it would not have been made in the way it was, to have the properties it has. The form includes the final cause, by specifying the functions that explain why the hammer is made as it is.

Similarly, Aristotle claims, a natural organism has a formal cause specifying the function that is the final cause of the organism. The parts of an organism seem to perform functions that benefit the whole (the heart pumps blood, the senses convey useful information). Aristotle claims that organs have final causes; they exist in order to carry out the beneficial functions they actually carry out. The form of an organism is determined by the pattern of activity that contains the final causes of its different vital processes. Hence Aristotle believes that form as well as matter plays a causal role in natural organisms.

To claim that a heart is for pumping blood to benefit the organism is to claim that there is some causal connection between the benefit to the organism and the processes that constitute the heart's pumping blood. Aristotle makes this causal claim without saying why it is true. He does not say, for instance, either (1) that organisms are the products of intelligent design (as Plato and the Stoics believe), or (2) that they are the outcome of a process of evolution.

Aristotle's account of causation and explanation is expressed in the content and argument of many of his biological works (including those connected with psychology). In the *Parts of Animals* and *Generation of Animals* for instance, he examines the behaviour and structure of organisms and their parts both to find the final causes and to describe the material and efficient basis of the goal-direction that he finds in nature (*Parts of Animals* I 1). He often argues that different physiological processes in different animals have the same final cause.

Some ascribe to Aristotle an 'incompatibilist' view of the relation between final causes and the underlying material and efficient causes. Incompatibilists concede that every goal-directed process (state, event) requires some material process (as nutrition, for example, requires the various processes involved in digesting food), but they argue that the goal-directed process cannot be wholly constituted by any material process or processes; any process wholly constituted by material processes is (according to the incompatibilist) fully explicable in material-efficient terms, and therefore has no final cause.

Probably, however, Aristotle takes a 'compatibilist' view. He seems to believe that even if every goal-directed process were wholly constituted by material processes, each of which can be explained in material-efficient terms, the final-causal explanation would still be the only adequate explanation of the process as a whole. According to this view, final causes are irreducible to material-efficient causes, because the explanations given by final causes cannot be replaced by equally good explanations referring only to these other causes. This irreducibility, however, does not require the denial of material constitution.

10 Change

Aristotle studies nature as an internal principle of change and stability; and so he examines the different types of change (or 'motion'; *kinēsis*) that are found in the natural elements and in the natural organisms composed of them. In *Physics* III 1 he defines change as 'the actuality of the potential *qua* potential'. His definition marks the

importance of his views on potentiality (or ‘capacity’; *dynamis*) and actuality (or ‘realization’; *energeia* or *entelecheia*) (see *Metaphysics* IX 1-9).

The primary type of potentiality is a principle (*archē*) of change and stability. If *x* has the potentiality *F* for *G*, then (1) *G* is the actuality of *F*, and (2) *x* has *F* because *G* is the actuality of *F*. Marathon runners, for instance, have the potentiality to run 26 miles because they have been trained to run this distance; hearts have the capacity to pump blood because this is the function that explains the character of hearts. In these cases, potentialities correspond to final causes.

Potentiality and possibility do not, therefore, imply each other. (1) Not everything that is possible for *x* realizes a potentiality of *x*. Perhaps it is possible for us to speak words of Italian (because we recall them from an opera) without having a potentiality to speak Italian (if we have not learnt Italian). (2) Not everything that *x* is capable of is possible for *x*; some creatures would still have a potentiality to swim even if their environment lost all its water.

These points about potentiality help to clarify Aristotle’s definition of change. The building of a house is a change because it is the actuality of what is potentially built in so far as it is potentially built. ‘What is potentially built’ refers to the bricks (and so on). The completed house is their complete actuality, and when it is reached, their potentiality to be built is lost. The process of building is their actuality in so far as they are potentially built. ‘In so far… ’ picks out the incomplete actuality that is present only as long as the potentiality to be built (lost in the completed house) is still present. Aristotle’s definition picks out the kind of actuality that is to be identified with change, by appealing to some prior understanding of potentiality and actuality, which in turn rests on an understanding of final causation.

In the rest of the *Physics*, Aristotle explores different properties of change in relation to place and time. He discusses infinity and continuity at length, arguing that both change and time are infinitely divisible. He tries to show that the relevant type of infinity can be defined by reference to potentiality, so as to avoid self-contradiction, paradox or metaphysical extravagance. In his view, infinite divisibility requires a series that can always be continued, but does not require the actual existence of an infinitely long series. Once again, the reference to potentiality (in ‘can always… ’) has a crucial explanatory role.

11 Metaphysics

Some of the basic concepts of the *Categories* and *Physics* - including substance, particular, universal, form, matter, cause and potentiality - are discussed more fully in the *Metaphysics*. This is a collection of fourteen books, some of them loosely connected. Aristotle probably did not deliver a course of lectures in the order of the present treatise. Parts of book I are almost repeated in book XIII. Book V is a ‘philosophical dictionary’ that seems to interrupt the argument of books IV and VI. Book XI summarizes parts of book IV. Books II and XI were probably not written entirely by Aristotle.

Still, whatever their literary origins, all these books have a common subject matter, since they all contribute to the universal science that studies the common presuppositions of the other sciences. This universal science has four names. (1) ‘First philosophy’: it studies the ‘first principles’ and ‘highest causes’ (including the four causes of the *Physics*) presupposed by the other sciences. (2) ‘The science of being’: every science presupposes that it studies some sort of being, and the science of being examines and defends this presupposition. (3) ‘Theology’: first philosophy is not only first in so far it is most universal, but also in so far as it deals with the primary sort of being, the sort on which all other beings depend. The primary sort of being is substance, and the primary sort of substance is divine substance; hence the science of being must study divine substance. (4) ‘Metaphysics’ (*ta meta ta physika*; ‘the things after the natural things’): it is ‘after’ or ‘beyond’ the study of nature because (a) as theology, it studies entities outside the natural order, and (b) as first philosophy, it starts from the study of nature (which is prior and better known ‘to us’) and goes beyond it to its foundations and presuppositions (which are prior and better known ‘by nature’; see §3).

The first three of these names are used by Aristotle himself (*Metaphysics* IV 1-3, VI 1). The fourth was given to the treatise in antiquity (at an uncertain date); its use of ‘after’ captures Aristotle’s different claims about the relation of the universal science to other sciences.

The universal science is the science of being *qua* being - that is, being in so far as it is being - just as mathematics is the science of some beings *qua* mathematical objects (see §16) and physics is the science of some beings *qua* changeable. The science of being studies the beings that are also studied by other sciences, but it isolates the relevant properties of beings by a different level of abstraction; it does not rely on the fact that they have the properties of mathematical or natural objects, but simply on the fact that they are beings studied by a science (*Metaphysics* IV 1-2).

A special science assumes that it begins with a subject that has properties. The universal science is the science of being because it studies the sort of subject that is presupposed by the other sciences; and it is primarily the science of substance because substance is the primary sort of being. Aristotle's analysis of change in *Physics* I introduces substances as subjects; the *Metaphysics* asks what sorts of subjects and substances must be recognized by special sciences.

Aristotle argues that if we are to signify a subject, it is impossible for each of its properties both to belong and not to belong to it. This principle is often called the 'Principle of Non-Contradiction' (*Metaphysics* IV 3-4). To defend the principle, Aristotle considers an opponent who is willing to assert that a single subject, man, is both a bipedal animal and not a biped animal. If the opponent really says this about a single subject, then, when he uses 'man', he must signify one and the same subject, man. If he agrees that in using 'man' he signifies a biped animal, then he cannot also deny that man is a biped animal; for if he denies this, he can no longer say what 'man' signifies, and hence he cannot say what subject it is that he takes to be both a biped animal and not a biped animal. This property (which one cannot also deny of a subject) is an essential property. Hence, the attempt to reject subjects with essential properties is self-undermining.

Subjects of change must also, according to Aristotle, have objective properties (that is, properties that they have whether or not they appear to have them). An argument against Protagoras seeks to show that any attempt to reject objective properties undermines itself (*Metaphysics* IV 5). Protagoras denies that there are any objective properties, because he claims that how things appear to someone is how they are. If he is to maintain the infallibility of appearances against any possibility of correction, then, Aristotle argues, he must claim that it is possible for the same subject to change in every respect at every time (to match different appearances). This is possible, however, only if the same subject can remain in being, but change in all respects. Aristotle replies that if the same subject persists, it must keep the same essential property (the 'form'); hence it cannot change in every respect (IV 5).

12 From being to substance

In *Metaphysics* IV 2 and VII 1 Aristotle argues that, since substance is the primary type of being and other beings are in some way dependent on substances, the science of being must primarily be concerned with substance. The arguments of IV 4-5 describe some features of substances; they must be subjects with stable, objective, essential properties. Books VII-IX describe these subjects more fully, by re-examining the conception of substance that is presented in the *Categories* and *Physics* (see §§7-8).

Aristotle observes that we regard substance both as 'a this' and as 'essence' (or 'what it is'). We might assume that these two descriptions pick out two sorts of substances - a particular subject ('this') and a universal ('what it is'), corresponding to the first and second substances of the *Categories*. Aristotle, however, insists that his question 'What is substance?' will be satisfactorily answered only when we have found the one thing that best satisfies the conditions for being both a subject (a 'this') and an essence ('what it is'). Whatever best satisfies these conditions is primary substance.

The different candidates that Aristotle considers for this role are matter, form and the compound of the two. He argues against the first and third candidates, and defends the second. He regards matter and compound as types of substance, but argues that they are secondary to form because they do not meet the relevant conditions to the same degree. To show that form is primary substance, he argues that a form is both a subject and an essence of the right sort. In books VIII-IX he clarifies his answer by identifying form with the actuality for which the matter is the potentiality.

13 Why is form substance?

In claiming that form is substance, Aristotle relies on the connections between form, cause, essence and identity. He rejects the eliminative view (§8) that the so-called 'coming-to-be' or 'perishing' of an artefact or organism is simply an alteration of the matter. According to the eliminative view, this alteration does not involve the existence or non-existence of a distinct substance, any more than Socrates' coming to be musical involves the existence of a distinct substance, musical Socrates. Aristotle replies that the production of an artefact and the generation of an organism introduce a new subject, a substance that is neither identical to nor wholly dependent on the matter that constitutes it at a time (see Identity §2). Although this statue of Pericles has come into being from a particular piece of bronze, we may repair the statue by replacing damaged bits; we preserve the same statue but we cause a different bit of bronze to constitute it. Similarly, an organism remains in existence as long as it replaces its matter with new matter: it persists as long as its form persists (*Generation and Corruption* I 5).

When Aristotle speaks of the relation of form to matter, he may refer to either of two kinds of matter: (1) the proximate, organic matter (for example, the organs and limbs making up the organic body); and (2) the remote, non-organic matter (for example, blood, earth, water) of which the organic body is made. Remote matter can exist without the form of the organism, but the organism can persist without any particular piece of remote matter. Proximate matter cannot exist without the form (since it is the function of an arm or heart that makes it the limb or organ it is); the form is the actuality of which the proximate matter is the potentiality (*On the Soul* 412a10; *Metaphysics* 1038b6, 1042b10).

The role of the form in determining the persistence of an organism results from its role as the source of unity. The form, including the organism's vital functions, makes a heap of material constituents into a single organism (*Metaphysics* VII 16). A collection of flesh and bones constitutes a single living organism in so far as it has the form of a man or a horse; the vital functions of the single organism are the final cause of the movements of the different parts. The organism remains in being through changes of matter, as long as it retains its formal, functional properties. Since the structure, behaviour and persistence of the organism must be understood by reference to its form, the form is irreducible to matter (see §9); the organism, defined by its form, must be treated as a subject in its own right, not simply as a heap of matter.

These facts about organisms explain why Aristotle sees a close connection between primary substance and form. Organisms are substances primarily because of their formal properties, not because of their material composition; hence we cannot identify all the basic subjects there are unless we recognize the reality of formal properties and of subjects that are essentially formal.

14 What are substantial forms?

The conclusion that primary substance and form are closely connected, however, explains only why some substances are essentially formal; it does not explain why form itself is substance. To explain this further claim, we need to decide whether Aristotle regards a substantial form as (1) a species form (shared by all members of a given species, for example, the form of man or horse), normally taken to be a universal, or as (2) a particular form, proprietary to (for example) Socrates. (See *Metaphysics* VII 10-16, XII 5, XIII 10, *Generation of Animals* IV 3 for important evidence.)

Some points favouring the 'universal solution' are the following. (1) Aristotle often contrasts the form with the compound of form and matter, and describes particulars as compounds; hence he apparently does not regard particulars as forms. (2) Similarly, he says that a particular differs from a universal in having both form and matter; hence no particular seems to be simply a form. (3) He says the form is what is specified in a definition, but there is no definition of a particular; hence a particular apparently cannot be a form. (4) He says that substance is prior in knowledge to non-substance, but scientific knowledge of particulars is impossible; hence they apparently cannot be substances, and only a universal can be a substance.

In favour of the 'particular solution' it may be argued: (1) a substance must be a subject, whereas all universals are said of subjects; (2) a substance must be a 'this', as opposed to a 'such', and hence, apparently, some sort of particular; (3) Aristotle argues at length that no universal can be a substance.

We might be tempted to conclude that Aristotle's position is inconsistent. His conviction that substance as 'this' and substance as 'what is it' must be the same thing leads him to insist that the successful candidate for substance must satisfy the criteria for being both a this (a subject, and hence a particular) and an essence (a property, and

hence a universal). If one and the same thing cannot satisfy both criteria, then no one thing can satisfy all Aristotle's conditions for being a substance.

We need not draw this conclusion, however. We can maintain that Aristotle consistently favours the universal solution, if we can show: (1) a 'this' need not be a particular; (2) some universals are subjects; (3) a species form is not the sort of universal that cannot be a substance.

We can maintain that he consistently favours the particular solution, if we can show the following. (1) The contrast between form and matter does not imply that they are always mutually exclusive; some forms may be constituted by, or embodied in, particular bits of matter. Sometimes, indeed, Aristotle speaks as though a form is a subject that can persist and perish and can exchange its matter. (2) The sense in which particulars do not allow definition and scientific knowledge does not prevent them from also being, in an appropriate sense, prior in definition and knowledge to universals (*Metaphysics* XIII 10 may attribute the relevant priority to particular substances).

These two solutions are different ways of expressing Aristotle's belief that substances are basic. Both his metaphysics and his natural philosophy express and defend the conviction that natural organisms and their kinds are substances because they are fundamental; they are fundamental because they are irreducible to their constituent matter. It is more difficult to decide whether the individuals or their kinds are more fundamental. Perhaps, indeed, we ought not to decide; different things may be fundamental or irreducible in different ways.

15 Universals, Platonic Forms, mathematics

These disputes partly concern Aristotle's attitude to the reality of universals. One-sided concentration on some of his remarks may encourage a nominalist or conceptualist interpretation (see Nominalism §§1, 2). (1) He rejects Plato's belief (as he understands it) in separated universal Forms (see Plato §§10, 12-16), claiming that only particulars are separable. (2) In *Metaphysics* VII 13-16 he appears to argue that no universal can be a substance. (3) He claims that the universal as object of knowledge is - in a way - identical to the knowledge of it (*On the Soul* 417b23).

Other remarks, however, suggest realism about universals. (4) He claims they are better known by nature; this status seems to belong only to things that really exist. (5) He believes that if there is knowledge, then there must be universals to be objects of it; for our knowledge is about external nature, not about the contents of our own minds.

Aristotle's position is consistent if (1)-(3) are consistent with the realist tendency of (4)-(5). The denial of separation in (1) allows the reality of universals. Similarly, (2) may simply say that no universals are primary substances (which are his main concern in *Metaphysics* VII). And (3) may simply mean (depending on how we take 'in a way') that the mind's conception of the extra-mental universal has some of the features of the universal (as a map has some of the features of the area that it maps). While Aristotle denies that universals can exist without sensible particulars to embody them, he believes they are real properties of these sensible particulars.

He offers a rather similar defence of the reality, without separability, of mathematical objects (*Physics* II 2; *Metaphysics* XIII 3). While agreeing with the Platonist view that there are truths about, for example, numbers or triangles that do not describe the sensible properties of sensible objects, he denies that these truths have to be about independently-existing mathematical objects. He claims that they are truths about certain properties of sensible objects, which we can grasp when we 'take away' (or 'abstract') the irrelevant properties (for example, the fact that this triangular object is made of bronze). Even though there are no separate objects that have simply mathematical properties, there are real mathematical properties of sensible objects.

16 Metaphysics: God

When Aristotle claims that first philosophy is also theology (see §11), he implies that the general discussion of being and substance is the basis for the special discussion of divine substance. (Hence later writers distinguish 'special metaphysics', dealing with God, from 'general metaphysics', dealing with being in general.) The different features of substance explained in *Metaphysics* VII-IX are included in the divine substance of XII. (1) Primary substance is to be identified in some way with form rather than with matter or with the compound of form and matter; divine substance is pure form without matter. (2) Primary substance is in some way numerically one, a

'this' rather than a 'such'; divine substance is completely one and indivisible. (3) Primary substance is in some way actuality rather than potentiality; divine substance is pure actuality with no potentiality. (4) Primary substance is soul rather than body (see §17); divine substance is pure intellect without sense or body.

In each case the properties of primary substance are found in a sensible substance (an animal or a plant) only in so far as they belong to an object that also has other properties; hence primary substance in sensible reality is the form and actuality of an object (a horse, for example) that also has matter and potentiality. In divine substance, however, each feature is found in separation from these other properties; that is why a divine substance lacks matter, multiplicity, parts or potentiality. Aristotle argues that a substance with these pure substantial properties must exist if any sensible substances are to exist; for the existence of potentialities that can be actualized presupposes the existence of an actuality that does not itself include any potentiality (to avoid an infinite regress).

Since this primary type of substance is divine, it is what traditional belief in the Olympian gods was about, what the Presocratics were talking about when they spoke of 'the divine', and what Plato was talking about in speaking of a supreme god. Aristotle mentions the traditional Olympian gods without committing himself to acceptance of the traditional conception of them. He rejects anthropomorphic views of the gods, but he speaks of the divine nature as a kind of mind. He believes that there is something divine about the order and workings of nature, and still more divine in the heavenly substances (*Parts of Animals* I 5). Although he continues to speak of gods in the plural, he also speaks of one divine mind as the ultimate cause of the whole universe; these remarks help to justify the later interpreters who take him to speak of the one God who is the subject of (for example) Aquinas' 'Five Ways' (*Summa Theologiae* 1a q.2 a.3) (see Aquinas, T. §11).

Aristotle's God is the ultimate cause of the physical universe, but not its creator (as Plato's demiurge is), since Aristotle believes the universe is eternal. Nor does Aristotle suggest that God has providence or foreknowledge concerned with future contingent events. But he believes that the physical universe is dependent on God. In *Physics* VIII he argues that the explanation of motion requires recognition of a first cause of motion, and in *Metaphysics* XII this first cause is identified with divine, immaterial, substance. This first mover is itself unmoved; it initiates motion only as an object of love initiates motion by attraction. It is the ultimate final cause of the various movements in the universe.

In treating the divine substance as a god, and hence as a being with a soul and an intellect, Aristotle attributes some mental life to it. But since it would be imperfect if it thought of objects outside itself (because it would not be self-sufficient), it thinks only of its own thinking. This restriction, however, is not as severe as it may seem, since Aristotle believes that the various objects of thought are in some way identical to the mind that thinks them (see §15). In so far as God thinks of his own mind, he thereby also contemplates the order of the universe as a whole; this is the order that the different movements in the universe seek to embody.

Sometimes (as in *Physics* VIII) Aristotle argues for a single first mover. In *Metaphysics* XII, however, he argues that an unmoved mover must be postulated for each of the distinct movements of the heavenly bodies. This astronomical interpretation of his theological doctrine is difficult to reconcile with his belief, reaffirmed in *Metaphysics* XII 10, that in some way the universe is unified by a single first unmoved mover.

17 Soul and body

Aristotle's treatise *On the Soul* is placed among the works on natural philosophy, but should be read with *Metaphysics* VII-IX. In Aristotle's view, disputes about soul and body are simply a special case of the more general disputes about form and matter. He rejects both the Presocratic materialist assumption that the soul is simply non-organic matter, and the Platonic dualist claim that it must be something entirely non-bodily. He argues that soul is substance because it is the form of a natural body, and that the body is the matter informed by the soul. Although the soul is a substance distinct from the non-organic body (the collection of non-organic matter belonging to a living organism; see §13), it is not immaterial (if being immaterial excludes being composed of matter), nor is it independent of some non-organic body or other.

Aristotle assumes that the soul is the primary principle of life, and hence that it distinguishes the living from the non-living. A living organism is nourished, grows and diminishes, through itself - from a causal origin within itself rather than from the action of external agents. A living organism must, therefore, be teleologically ordered, since

(for Aristotle) nutrition and growth cannot be understood without appeal to final causation (see Teleology).

If life must be conceived teleologically, and the soul is the *primary* principle of life, then the soul is form rather than matter. For the primary principle is whatever explains our vital activities; since these are goal-directed activities, their explanation must refer to the goal-directed features of the subject, and so to the form rather than the matter. If the soul is what we live by primarily, it must be the final cause of the body, and so a formal, not a material, aspect of the subject. Soul must, therefore, be substance as form.

Aristotle attributes to the soul the features of substantial form (see §13). (1) It is a substance that is irreducible to a material non-organic body (remote matter); to that extent the soul is incorporeal, and not just some ordinary material stuff. (2) It is the source of unity that makes a heap of material constituents into a single organism. For a collection of flesh and bones constitutes a single living organism in so far as it is teleologically organized; the activities of the single organism are the final cause of the movements of the different parts. Since a single organism has a single final cause, it has a single soul and a single body. (3) The identity and persistence of the soul determine the identity and persistence of the creature that has it. If something has a soul in so far as it has life, then Socrates perishes if and only if his soul does. The truth of this Platonic claim (*Phaedo* 115c-e) does not imply Platonic dualism. (4) The definition of a soul must mention the proximate material subject (the organic body and its parts) whose capacities are actualized in the functions of the organism (*Metaphysics* 1036b28-30). A soul must be non-coincidentally connected to a specific sort of organic body (*On the Soul* 407b20-4).

Some of the puzzles in Aristotle’s doctrine of substantial form arise in his doctrine of soul and body. If, for instance, he recognizes particular substantial forms, then he also recognizes (as the previous paragraph assumes) the individual souls of Socrates and Callias; if, however, he recognizes only one substantial form for each species, then he recognizes only one soul for human beings, another for horses, and so on.

Since the soul is the form of the living body, an account of the different ‘parts’ or ‘capacities’ (or ‘faculties’; *dynameis*) of the soul does not describe the different physiological processes underlying the different activities of a living organism, but describes their formal and goal-directed aspects. Aristotle describes the capacities that distinguish the different types of souls: nutrition (characteristic of plants), perception and appearance (characteristic of animals) and rational thought (characteristic of rational animals) (see Psychē). He describes some of the physiological basis of these psychic capacities in the shorter treatises on natural philosophy, including the *Parva Naturalia*, the *Movement of Animals*, and the *Progression of Animals*.

18 Perception

To define perception, Aristotle returns to his contrast between form and matter. Perception happens in so far as (1) the perceiver becomes like the object (*On the Soul* 417a18); (2) the perceiver that was potentially *F* (for example, white) becomes actually *F* when it perceives the actually *F* object (418a3); (3) the perceiver acquires the form, but not the matter, of the object (424a18-24). These descriptions express a realist view of perception and its objects; Aristotle assumes in (2) that an object is actually white, square, and so on in its own right, before we perceive it.

He is sometimes taken to imply in (1) that perception requires physical similarity; but (3) counts against this interpretation. A sense receives the form without the matter in the way in which a house without matter is in the soul of the architect before the house is built. In the latter case, nothing that looks like a house is in the builder, but features of the house correspond to features of the builder’s design. Similarly, when we hear a tune, our ears do not necessarily sound like the tune, but a state of us systematically corresponds to the tune (as features of a map correspond to features of the area it maps).

A ‘common sense’ perceives common properties of sensible objects, such as size, shape and number, which are all perceived through the perception of motion (*On the Soul* 425a14-20). This is not a sixth sense independent of the other five, but the result of the cooperation of the five senses. Aristotle argues that we can explain our grasp of these common properties without supposing that they are objects of intellect rather than sense (contrast Plato, *Theaetetus* 184-6).

19 Appearance and thought

Appearance (or ‘imagination’; *phantasia*) links perception to goal-directed movement. A lion sees or smells a deer;

it takes pleasure in the prospect of eating the deer, and so wants to catch the deer. To connect perception with pleasure and desire, we need to say how the deer appears to the lion (as prey); this is what Aristotle calls the lion's appearance of the deer (*On the Soul* III 3, 7).

Aristotle denies that this appearance constitutes a belief (*doxa*). He argues that belief requires reason and inference, which non-human animals lack; in his view, they lack any grasp of a universal, and have only appearances and memory of particulars (*Nicomachean Ethics* 1147b4-5). The operations of sense, memory and experience are necessary, but not sufficient, for the grasp of a universal that is expressed in concepts and beliefs (*Posterior Analytics* II 19; *Metaphysics* I 1).

Concepts and beliefs require intellect (*nous*) actualized in 'understanding' or 'thinking' (*noein*; *On the Soul* III 4) (see Nous). Thought differs from perception in so far as it grasps universal essences - for example, what flesh is, as opposed to flesh. Perception does not include grasp of the universal as such; in grasping the universal, we recognize some feature of our experience as a ground for attributing the universal to a particular that we experience.

To explain how the mind is capable of grasping universals when we interact causally with particular perceptible objects, Aristotle distinguishes two aspects of intellect - passive and 'productive' (or 'active' or 'agent') - claiming that these two aspects must combine to produce thought of universals (*On the Soul* III 5). He does not say how productive intellect contributes to our grasp of universals. Later interpreters suggest that productive intellect abstracts the aspects relevant to the universal from the other features of particulars that are combined with them in perception (Aquinas, *Summa Theologiae* 1a q.79 a.3).

Aristotle takes the presence of this productive intellect to be necessary for any thinking at all. Moreover, he believes that productive intellect is capable of existing without a body. He still maintains his belief in the inseparability of soul from body; for since productive intellect is not a type of soul, its separate existence is not the separate existence of a soul.

20 Desire and voluntary action

Perception, appearance and thought are connected to goal-directed movement by means of desire. The appearance of something as desirable is the source of an animal's tendency to pursue one sort of thing rather than another. External objects, however, appear desirable to different agents in different ways. Aristotle distinguishes the appetite (*epithymia*) that animals have from the wish (rational desire; *boulēsis*) that only rational agents have; appetite is for the pleasant and wish is for the good (*On the Soul* 414b2-6, 432b5-7, *Politics* 1253a15-18).

A rational agent's wish differs from appetite in so far as it is guided by deliberation resting on one's conception of one's good. Such a conception extends beyond one's present inclinations both at a particular time and over time. Rational agents are aware of themselves as extending into past and future. Deliberation that is guided by reference to these broader aspects of one's aims and nature results in the rational choice that Aristotle calls 'decision' (*prohairesis*; *Nicomachean Ethics* III 3).

Agents who act on desire and appearance also act voluntarily (*hekousiōs*), in so far as they act on some internal principle (*archē*). While voluntary action is not confined to rational agents, their voluntary action has special significance, because it is an appropriate basis for praise and blame. Since it has an internal principle, it is in our control as rational agents, and therefore we are justly praised and blamed for it. We are held responsible for our actions in so far as they reflect our character and decisions (*Nicomachean Ethics* III 1-5).

Aristotle's defence of his belief that we are appropriately responsible agents does not confront the questions later raised by Epicurus' claim that responsibility is incompatible with the complete causal determination of our actions (see Epicureanism §12). An incompatibilist position is ascribed to Aristotle by Alexander in *On Fate* (see Alexander of Aphrodisias §4.) Aristotle neither explicitly presents an incompatibilist position nor explicitly endorses a compatibilist position of the sort later defended by the Stoics.

A discussion of time, truth and necessity (the 'Sea Battle'; *De Interpretatione* 9) has suggested to some interpreters that Aristotle is an indeterminist. His opponent is a fatalist, who assumes that (1) future-tensed statements about human actions (for example, 'There will be a sea battle tomorrow') were true in the past, and infers that (2) the future is necessarily determined, independently of what we choose. Aristotle certainly rejects (2). If he accepts the

validity of the fatalist's argument, and rejects (1), then he accepts indeterminism.

An alternative reply to the fatalist would be to accept (1) and to deny the validity of the argument. We might argue that the past truth of statements about my actions does not imply that my actions are determined independently of my choices. If on Friday Socrates decides to walk, and he acts on his decision on Friday, then it was true on Thursday that Socrates would walk on Friday, and also true that on Friday he would act on his decision to walk, but it was not true on Thursday that he would walk whether or not he decided to (see Stoicism §21). Probably Aristotle accepts this alternative reply to the fatalist, and hence does not endorse indeterminism.

21 The human good

Aristotle's account of rational agents, choice, deliberation and action is an appropriate starting point for his ethical theory. Ethics is concerned with the praiseworthy and blameworthy actions and states of character of rational agents; that is why it concerns virtues (praiseworthy states) and vices (blameworthy states) (see Aretē).

Aristotle's ethical theory is mostly contained in three treatises: the *Magna Moralia*, the *Eudemian Ethics* and the *Nicomachean Ethics*. The titles of the last two works may reflect a tradition that Eudemus (a member of the Lyceum) and Nicomachus (the son of Aristotle and Herpyllis) edited Aristotle's lectures. The *Magna Moralia* is widely agreed not to have been written by Aristotle; some believe, with good reason, that it contains a student's notes on an early course of lectures by Aristotle. The *Eudemian Ethics* is now widely agreed to be authentic, and generally (not universally) and reasonably taken to be earlier than the *Nicomachean Ethics*. Three books (*Nicomachean Ethics* V-VII = *Eudemian Ethics* IV-VI) are assigned by the manuscripts to both the *Eudemian Ethics* and the *Nicomachean Ethics*.

Aristotle conceives 'ethics' (*Magna Moralia* 1181a24) as a part of political science; he treats the *Nicomachean Ethics* and the *Politics* as parts of a single inquiry (*Nicomachean Ethics* X 9). Ethics seeks to discover the good for an individual and a community (*Nicomachean Ethics* I 2), and so it begins with an examination of happiness, (*eudaimonia*). ('Wellbeing' and 'welfare' are alternative renderings of *eudaimonia* that may avoid some of the misleading associations carried by 'happiness'; see Eudaimonia.) Happiness is the right starting point for an ethical theory because, in Aristotle's view, rational agents necessarily choose and deliberate with a view to their ultimate good, which is happiness; it is the end that we want for its own sake, and for the sake of which we want other things (so that it is the ultimate non-instrumental good). If it is to be an ultimate end, happiness must be complete (or 'final'; *teleion*) and self-sufficient (*Nicomachean Ethics* I 1-5, 7).

To find a more definite account of the nature of this ultimate and complete end, Aristotle argues from the human function (*ergon*), the characteristic activity that is essential to a human being in the same way that a purely nutritive life is essential to a plant and a life guided by sense perception and desire is essential to an animal (*Nicomachean Ethics* I 7). Since a human being is essentially a rational agent, the essential activity of a human being is a life guided by practical reason. The good life for a human being must be good for a being with the essential activity of a human being; hence it must be a good life guided by practical reason, and hence it must be a life in accordance with the virtue (*aretē*) that is needed for achieving one's good. The human good, therefore, is an actualization of the soul in accordance with complete virtue in a complete life. This 'complete virtue' appears to include the various virtues described in the following books of the *Nicomachean Ethics*; this appearance, however, may be challenged by *Nicomachean Ethics* X (see §26).

22 Virtue of character

From the general conception of happiness Aristotle infers the general features of a virtue of character (*ēthikēaretē*; *Nicomachean Ethics* I 13). He agrees with Plato in recognizing both rational and non-rational desires (see Plato §14). One's soul is in a virtuous condition in so far as the non-rational elements cooperate with reason; in this condition human beings fulfil their function well. The argument from the human function does not make it clear what states of a rational agent count as fulfilling the human function. Aristotle seeks to make this clearer, first through his general account of virtue of character, and then through his sketches of the individual virtues.

A virtue of character must be a 'mean' or 'intermediate' state, since it must achieve the appropriate cooperation between rational and non-rational desires; such a state is intermediate between complete indulgence of non-rational desires and complete suppression of them. (Aristotle is not recommending 'moderation' - for

example, a moderate degree of anger or pleasure - in all circumstances.) The demand for cooperation between desires implies that virtue is more than simply control over desires; mere control is ‘continence’ (*enkrateia*) rather than genuine virtue.

The task of moral education, therefore, is to harmonize non-rational desires with practical reason. Virtuous people allow reasonable satisfaction to their appetites; they do not suppress all their fears; they do not disregard all their feelings of pride or shame or resentment (*Nicomachean Ethics* 1126a3-8), or their desire for other people’s good opinion. Aristotle’s sketches of the different virtues show how different non-rational desires can cooperate with practical reason.

23 Virtue, practical reason and incontinence

A virtuous person makes a decision (*prohairesis*) to do the virtuous action for its own sake. The correct decision requires deliberation; the virtue of intellect that ensures good deliberation is prudence (or ‘wisdom’, *phronēsis*; *Nicomachean Ethics* VI 4-5); hence the mean in which a virtue lies must be determined by the sort of reason by which the prudent person would determine it (1107a1-2). Virtue of character is, therefore, inseparable from prudence. Each virtue is subject to the direction of prudence because each virtue aims at what is best, as identified by prudence.

In claiming that prudence involves deliberation, Aristotle also emphasizes the importance of its grasping the relevant features of a particular situation; we need to grasp the right particulars if deliberation is to result in a correct decision about what to do here and now. The right moral choice requires experience of particular situations, since general rules cannot be applied mechanically. Aristotle describes the relevant aspect of prudence as a sort of perception or intuitive understanding of the right aspects of particular situations (*Nicomachean Ethics* VI 8, 11).

These aspects of prudence distinguish the virtuous person from ‘continent’ and ‘incontinent’ people (*Nicomachean Ethics* VII 1-10). Aristotle accepts the reality of incontinent action (*akrasia*), rejecting Socrates’ view that only ignorance of what is better and worse underlies apparent incontinence (see Socrates §6; Akrasia §1). He argues that incontinents make the right decision, but act contrary to it. Their failure to stick to their decision is the result of strong non-rational desires, not simply of cognitive error. Still, Aristotle agrees with Socrates in believing that ignorance is an important component of a correct explanation of incontinence, because no one can act contrary to a correct decision fully accepted at the very moment of incontinent action.

The error of incontinents lies in their failure to harmonize the demands of their appetites with the requirements of virtue; their strong appetites cause them to lose part of the reasoning that formed their decision. When they act, they fail to see clearly how their general principles apply to their present situation. If their failure results from an error in deliberation, it is clear why Aristotle insists that incontinent people lack prudence.

24 Choice, virtue, and pleasure

It is initially puzzling that virtuous people decide to act virtuously for its own sake as a result of deliberation. If they decide on virtuous action for its own sake, then their deliberation causes them to choose it as an end in itself, not simply as a means. Decision and deliberation, however, are not about ends but about ‘the things promoting ends’ (*ta pros ta telē*, often rendered ‘means to ends’). Aristotle’s description of the virtuous person, then, seems to attribute to decision a role that is excluded by his explicit account of decision.

This puzzle is less severe once we recognize that Aristotle regards different sorts of things as ‘promoting’ an end. Sometimes he means (1) that the action is external and purely instrumental to the end; in this way buying food ‘promotes’ eating dinner. Sometimes, however, he means (2) that the action is a part or component of the end, or that performing the action partly constitutes the achieving of the end; in this way eating the main course ‘promotes’ eating dinner. Deliberation about this second sort of ‘promotion’ shows that an action is worth choosing for its own sake, in so far as it partly constitutes our end.

This role for deliberation explains how virtuous people can decide, as a result of deliberation, on virtuous action for its own sake; they choose it as a part of happiness, not as a merely instrumental means. Prudence finds the actions that promote happiness in so far as they are parts of the happy life. Such actions are to be chosen for their own sake, as being their own end; they are not simply instrumental means to some further end. The virtuous

person's decision results from deliberation about the composition of happiness; virtuous people decide on the actions that, by being non-instrumentally good, are components of happiness in their own right.

Aristotle's demand for the virtuous person to decide on the virtuous action for its own sake is connected with two further claims: (1) the virtuous person must take pleasure in virtuous action as such; (2) in doing so, the virtuous person has the pleasantest life. In these claims Aristotle relies on his views about the nature of pleasure and its role in happiness (*Nicomachean Ethics* VII 11-14, X 1-5).

He denies that pleasure is some uniform sensation to which different kinds of pleasant action are connected only causally (in the way that the reading of many boring books on different subjects might induce the same feeling of boredom). Instead he argues that the specific pleasure taken in *x* rather than *y* is internally related to doing *x* rather than *y*, and essentially depends on pursuing *x* for *x*'s own sake. Pleasure is a 'supervenient end' (1174b31-3) resulting from an activity that one pursues as an activity (*praxis* or *energeia*) rather than a mere process or production (*kinēsis* or *poiēsis*).

Aristotle insists, following Plato's *Philebus*, that the value of the pleasure depends on the value of the activity on which the pleasure supervenes (1176a3-29). The virtuous person has the pleasantest life, but the pleasantest life cannot aim exclusively at pleasure.

25 Virtue, friendship and the good of others

The virtuous person's deliberation, identifying the mean in relation to different desires and different situations, is articulated in the different virtues of character (described in *Nicomachean Ethics* III-V). The different virtues are concerned with the regulation of non-rational desires (for example, bravery, temperance, good temper), external goods (for example, magnificence, magnanimity) and social situations (for example, truthfulness, wit). Some concern the good of others to some degree (bravery, good temper, generosity).

Aristotle's Greek for virtue of character, *ēthikēaretē*, is rendered into Latin as 'virtus moralis'. The English rendering 'moral virtue' is defensible, since the virtues of character as a whole display the impartial concern for others that is often ascribed to morality. They are unified by the aim of the virtuous person, who decides on the virtuous action because it is 'fine' (*kalon*). Fine action systematically promotes the good of others; we must aim at it if we are to find the mean that is characteristic of a virtue (1122b6-7).

A second unifying element in the virtues, inseparable from concern for the fine, is their connection to justice (V 1-2). Aristotle takes justice to be multivocal (see §4), and distinguishes general justice from the specific virtue concerned with the prevention and rectification of certain specific types of injustices. General justice is the virtue of character that aims specifically at the common good of a community. Since it is not a different state of character from the other virtues, they must incorporate concern for the common good.

To explain why concern for the good of others, and for a common good, is part of the life that aims at one's own happiness, Aristotle examines friendship (*philia*; *Nicomachean Ethics* VIII-IX). All three of the main types of friendship (for pleasure, for advantage and for the good) seek the good of the other person. Only the best type - friendship for the good between virtuous people - includes *A*'s concern for *B*'s good for *B*'s own sake and because of *B*'s essential character (*Nicomachean Ethics* VIII 1-4).

In the best sort of friendship, the friend is 'another self'; *A* takes the sorts of attitudes to *B* that *A* also takes to *A*. Aristotle infers that friendship is part of a complete and self-sufficient life (IX 9-11). Friendship involves sharing the activities one counts as especially important in one's life, and especially the sharing of reasoning and thinking. Friends cooperate in deliberation, decision and action; and the thoughts and actions of each provide reasons for the future thoughts and actions of the other. The cooperative aspects of friendship more fully realize each person's own capacities as a rational agent, and so promote each person's happiness. Hence the full development of a human being requires concern for the good of others.

26 Two conceptions of happiness?

Although Aristotle emphasizes the other-regarding, social aspects of happiness, he also advocates pure intellectual activity (or 'study', *theōria*) - the contemplation of scientific and philosophical truths, apart from any attempt to apply them to practice (*Nicomachean Ethics* X 6-8). The connection between the human function and human

happiness (see §21) implies that contemplation is a supremely important element in happiness. For contemplation is the highest fulfilment of our nature as rational beings; it is the sort of rational activity that we share with the gods, who are rational beings with no need to apply reason to practice. Aristotle infers that contemplation is the happiest life available to us, in so far as we have the rational intellects we share with gods (see §16).

According to one interpretation, Aristotle actually identifies contemplation with happiness: contemplation is the only non-instrumental good that is part of happiness, and the moral virtues are to be valued - from the point of view of happiness - simply as means to contemplation. If this is Aristotle's view, it is difficult to see how the virtues of character are even the best instrumental means to happiness. Even if some virtuous actions are instrumental means to contemplation, it is difficult to see how the motives demanded of the virtuous person (see §§24-5) are always useful, rather than distracting, for those who aim at contemplation.

Probably, however, Aristotle means that contemplation is the best component of happiness. If we were pure intellects with no other desires and no bodies, contemplation would be the whole of our good. Since, however, we are not in fact merely intellects (*Nicomachean Ethics* 1178b3-7), Aristotle recognizes that the good must be the good of the whole human being. Contemplation is not the complete good for a human being.

If this is Aristotle's view, then contemplation fits the conception of happiness that is upheld in the rest of the *Nicomachean Ethics* and in the other ethical works. The virtues of character, and the actions expressing them, deserve to be chosen for their own sakes as components of happiness. In the virtuous person, they regulate one's choice of other goods, and so they also regulate one's choices about contemplation. The *Politics* may be taken to develop this conception of happiness, since (in book VII) it sets contemplation in the context of a social order regulated by the moral virtues.

27 Politics: ideal states

The *Politics* pursues three connected aims: (1) it completes the discussion of happiness, by showing what kind of political community achieves the human good (mainly books I, II and VII); (2) it sets out moral and political principles that allow us to understand and to criticize the different sorts of actual states and their constitutions (mainly books III and IV); (3) it offers some proposals for improving actual states (mainly books V and VI). The order of the books probably reflects Aristotle's aim of describing an ideal state after examining the strengths and weaknesses of actual states.

An individual's desire for happiness leads eventually to the city. A human being is a 'political animal', because essential human capacities and aims are completely fulfilled only in a political community; hence (given the connection between the human function and the human good) the individual's happiness must involve the good of fellow members of a community. The relevant sort of community is a *polis* ('city' or 'state') - a self-governing community whose proper function (not completely fulfilled by every actual political community) is to aim at the common good of its citizens, who (normally) share in ruling and in being ruled. The city is the all-inclusive community, of which the other communities are parts, since it aims at advantage not merely for some present concern but for the whole of life (*Nicomachean Ethics* 1160a9-30). Since happiness is complete and self-sufficient, the city is a complete and self-sufficient community (*Politics* 1252b28), aiming at a complete and self-sufficient life that includes all the goods needed for a happy life.

The connection between human nature, human good and the political community is most easily understood from Aristotle's account of friendship. Complete friendship, which requires living together and sharing rational discourse and thought, is restricted to individuals with virtuous characters, but this is not the only type of friendship that achieves self-realization in cooperation; a similar defence can be given for the friendship of citizens. Collective deliberation about questions of justice and benefit contributes to the virtuous person's self-realization because it extends the scope of one's practical reason and deliberation beyond one's own life and activities. Since the city is comprehensive, seeking to plan for everything that is needed for the complete good, a rational agent has good reason to want to share in its deliberations.

Since, then, Aristotle believes that political activity contributes in its own right to the human good, he argues against a 'social contract' theory that assigns a restricted instrumental function to the state (safety, or mutual protection, or the safeguarding of what justly belongs to each person; *Politics* III 9). Political life is to be valued for itself, apart from any instrumental benefit; the best city aims at the development of the moral virtues and at the

political participation of all who are capable of them.

In the light of these aims, Aristotle describes the best city. It has to assume favourable external conditions (geographical and economic) to allow the development of political life. Its criteria for citizenship are restricted, since they exclude everyone (including women and manual labourers) whom Aristotle regards as incapable of developing the virtues of character. Within the class of citizens, however, Aristotle is concerned to avoid gross inequality of wealth. and to ensure that everyone shares both in ruling and in being ruled. The institutions of the best state provide the political, social, economic and educational basis for the practice of the moral virtues and for contemplation.

28 Politics: imperfect states

Just as a correct conception of happiness is the basis of the ideal city, various incorrect conceptions of happiness define mistaken aims for different cities. These mistaken aims underlie the different conceptions of justice that are embodied in the constitutions of different cities. Partisans of oligarchy, for instance, take happiness to consist in wealth; they treat the city as a business partnership (*Politics* 1280a25-31). Partisans of democracy take happiness to consist simply in the satisfaction of desire; they assume that if people are equal in the one respect of being free rather than slaves, they are equal altogether, and should have an equal share in ruling (1280a24-5). Neither view is completely mistaken, since neither wealth nor freedom is irrelevant to questions of justice, but each is one-sided.

These one-sided views cause errors about the just distribution of political power or other goods. The proper basis for assigning worth in distribution will be whatever is relevant for the common good, since that is the aim of general justice. Since a correct conception of the common good requires a correct conception of happiness, a correct answer to the question about distribution must appeal to a true conception of happiness.

The criticism of existing constitutions seeks to show both how they fall short of the norms that are met by the ideal state, and how they can be improved. Aristotle wants to describe not only the ideal state, but also the best organization of each political system. In some circumstances, he believes, economic, social, and demographic facts may make (for example) democracy or oligarchy difficult to avoid. Still, an imperfect constitution can be improved, by attention to the aspects of justice, and hence the aspects of happiness, that this constitution tends to ignore. Even when Aristotle may appear to be engaged in empirical political sociology, or to be offering hints for the survival of a particular regime, he is guided by the moral and political principles that he defends in the more theoretical parts of the *Politics*.

29 Rhetoric and poetics

In Aristotle's classification, rhetoric and poetics (*poiētikē*; literally 'productive') count as 'productive' rather than 'practical' disciplines; they are concerned with 'production' (*poiēsis*) - purely instrumental action aiming at some external end - rather than with 'action' (*praxis*) - action that is also an end in itself. Rhetoric is a productive discipline in so far as it aims at persuasion in public speaking, and seeks the arguments, diction, language, metaphor, appeals to emotion and so on, that are most likely to persuade different types of audiences. Hence Aristotle's treatise on rhetoric contains sections on these different topics. Dialectic and logic are useful to a student of rhetoric, even though rhetoric does not aim at the truth; for true or plausible claims tend to be persuasive. *Rhetoric* II deals with another aspect of rhetorical persuasion, by describing the different emotions; the student of rhetoric must know how to arouse emotions in an audience.

Aristotle also takes his moral and political theory to be relevant to rhetoric, for two main reasons. (1) Rhetoric is concerned with the moral and political issues discussed in public assemblies or in courts, and the orator needs to be familiar with the convictions of a given audience. (2) Even more important, the orator should be guided by correct moral and political convictions (without necessarily grasping their philosophical basis). Aristotle does not endorse the conception of oratory as a technique of persuasion that is indifferent to the moral and political aims that it serves. This conception of oratory arouses Plato's criticism in the *Gorgias* (see Plato §7) Aristotle replies to such criticism by arguing that the orator should learn, and should be guided by, correct principles. He sets out some of these in the *Rhetoric*.

Moral and political principles are also relevant to Aristotle's treatment of literary criticism in the *Poetics*. The surviving part of this treatise deals mainly with tragedy. Some of it is similar to the *Rhetoric*, in so far as it

discusses matters of technique and psychology; Aristotle describes the various sorts of plots, characters, and dramatic devices that affect the audience in different ways. He is also concerned, however, about the moral aspects of tragedy; in this he may be responding to the criticisms of tragedy in book X of Plato's *Republic*. He argues that tragedy achieves its appropriate effect when it directs pity, fear, sympathy and revulsion at the appropriate sorts of people and situations; and he examines the plots and characters of various tragedies from this point of view (see Katharsis; Mimēsis).

30 Influence

Some aspects of Aristotle's philosophy have become so familiar that we do not even attribute them to him. When we say that an event was a mere 'coincidence', or that an ignorant person is 'ill-informed', or that someone's behaviour is forming good or bad 'habits', our vocabulary expresses Aristotelian assumptions, transmitted through Latin translations and interpretations.

The explicit influence of Aristotle's philosophical works and theories has been variable. In Hellenistic philosophy, he is not prominently cited or discussed (see Hellenistic philosophy); some have even doubted whether the major Stoics knew his works. From the first century BC, however, the study of Aristotle revived. This revival produced philosophers defending an Aristotelian position, often incorporating Stoic or Platonist elements, but sometimes sharpening contrasts between Aristotle and the Hellenistic schools (see Alexander of Aphrodisias; Peripatetics). These Aristotelians began a long series of Greek commentaries (lasting until the sixth century AD). Many of the later commentators were Neoplatonists; some of whom tried to reconcile Aristotelian with Platonic doctrines (see Aristotle Commentators; Platonism, Early and Middle §§8-9; Neoplatonism §1; Porphyry §2).

Between the sixth and the thirteenth centuries, most of Aristotle's works were unavailable in western Europe, although he was still studied in the Byzantine empire and the Islamic world (see Aristotelianism in Islamic philosophy). Two leading figures in the revival of Aristotelian studies and of Aristotelian philosophy in medieval Europe were the translator William of Moerbeke and Thomas Aquinas (see Aristotelianism, medieval). Aquinas' attempt to combine Aristotelian philosophy with orthodox Christian theology was at first rejected by ecclesiastical authority, but then came to be accepted (see Aquinas, T.).

The 'scholastic' philosophy of Aquinas and his successors is often opposed, but often presupposed, by Descartes, Locke, Hobbes and many of their successors, who often do not distinguish it from Aristotle's own philosophy. The reader who compares their representation of the scholastic position with Aristotle's own works (or with Aquinas) will often be surprised by the sharp differences between Aristotle's (and Aquinas') own positions and the positions that are attributed to him by the seventeenth-century philosophers who reject his authority (see Aristotelianism in the 17th century).

Modern historical study of Aristotle begins in the early nineteenth century. It has led to philosophical reassessment, and his works have once again become a source of philosophical insight and argument. Many of the themes of Aristotelian philosophy - the nature of substance, the relation of form to matter, the relation of mind to body, the nature of human action, the role of virtues and actions in morality - have reappeared as issues in philosophical debates, and Aristotle's contributions to these debates have influenced the course of philosophical discussion.

In some ways, Aristotle has suffered from his success. At different times he has been regarded as the indisputable authority in astronomy, biology, logic and ethics; hence he has represented the traditional position against which reformers have revolted. If he is regarded neither as the indisputable authority nor as a repository of antiquated and discarded doctrines, his permanent philosophical value can be more justly appreciated.

List of works

The works of Aristotle are usually cited by conventional Latin titles, or by English translations of these titles (often mere Anglicizations rather than proper translations). This list omits: works preserved in the Aristotelian corpus, but now generally agreed to be spurious; lost works; and the *Constitution of Athens* (probably not by Aristotle

himself; discovered after the standard arrangement of Aristotle's works was established).Neither the absolute nor the relative dates of individual treatises can be established (see §2). The list below follows the thematic order outlined in the entry.Recommended editions (Greek text with commentary) and translations of individual works are listed below. The standard text of most treatises appears in the Oxford Classical Texts (Oxford: Oxford University Press, various editors and dates), or, when these are lacking, in the Teubner texts (Leipzig: Teubner, various editors and dates). The Greek text, with facing English translation (not always reliable) appears in the Loeb Classical Library (Cambridge, MA: Harvard University Press and London: Heinemann, various editors and dates).

Aristotle (*c*. mid 4th century BC) *Aristotelis Opera*, ed. I. Bekker, Berlin: Reimer, 1831-70, 5 vols.(The first modern edition of the Greek text and the source of the page and line references normally used.)

Aristotle (*c*. mid 4th century BC) *The Works of Aristotle*, ed. W.D. Ross and J.A. Smith, Oxford: Oxford University Press, 1908-54, 12 vols.(The Oxford Translation.)

Aristotle (*c*. mid 4th century BC) *Topics (Topica)* trans. A.W. Pickard-Cambridge in *The Complete Works of Aristotle*, ed. J. Barnes, Princeton, NJ: Princeton University Press, 1984, 2 vols, 167-314.(The theory, strategy and tactics of dialectical argument.)

2 Natural philosophy

Aristotle (*c*. mid 4th century BC) *Physics (Physica)*, ed. W.D. Ross, in *The Works of Aristotle*, Oxford: Oxford University Press, 1949; Books I-II, trans. W. Charlton, Clarendon Aristotle Series, Oxford: Oxford University Press, 1970; Books III-IV trans. E.L. Hussey, Clarendon Aristotle Series, Oxford: Oxford University Press, 1983.(General principles of natural philosophy - form, matter, explanation - and their application to motion, infinity, place and time.)

Aristotle (*c*. mid 4th century BC) *On the Heavens (De caelo)*, Books I-II trans. S. Leggett, Warminster: Aris & Phillips, 1995.(Cosmology: application of Aristotle's theory of motion to the four elements and their interaction in the universe.)

Aristotle (*c*. mid 4th century BC) *Generation and Corruption (De generatione et corruptione)*, ed. H.H. Joachim, Oxford: Oxford University Press, 1922; trans. C.J.F. Williams, Clarendon Aristotle Series, Oxford: Oxford University Press, 1982.(Account of change in natural substances; alteration, growth, coming-to-be and perishing; matter and the four elements.)

Aristotle (*c*. mid 4th century BC) *Meteorology (Meteorologica)*, trans. H.D.P. Lee, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1952.(Collection of observations on winds, tides and other aspects of inanimate nature.)

Aristotle (*c*. mid 4th century BC) *History of Animals (Historia animalium)* trans. A.L.Peck, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1965-91, 3 vols.(Collection of observations on different kinds of animals and their behaviour, providing a basis for Aristotle's biological

explanations.)
Aristotle (*c*. mid 4th century BC) *Parts of Animals (De partibus animalium)*, Book I, trans. D.M. Balme, Clarendon Aristotle Series, Oxford: Oxford University Press, 1972.(Introduction to the study of animals; explanation of physiology, organs and behaviour, in light of Aristotle's explanatory scheme.)
Aristotle (*c*. mid 4th century BC) *Generation of Animals (De generatione animalium)*, trans. A.L.Peck, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1942.(Application of Aristotle's explanatory scheme to reproduction and heredity.)
Aristotle (*c*. mid 4th century BC) *On the Movement of Animals (De motu animalium)*, ed. and trans. M.C. Nussbaum. Princeton, NJ: Princeton University Press, 1978.(Physiology and psychological explanation of animal movement.)
Aristotle (*c*. mid 4th century BC) *On the Progression of Animals (De incessu animalium)*, trans. E.S. Foster, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1937.(Physiology of animal movement.)

3 Metaphysics

Aristotle (*c*. mid 4th century BC) *Metaphysics (Metaphysica)*, ed. W.D. Ross, Oxford: Oxford University Press, 1924, 2 vols; Books IV-VI, trans. C.A. Kirwan, Clarendon Aristotle Series, Oxford: Oxford University Press, 1971; Books VII-VIII trans. D. Bostock, Clarendon Aristotle Series, Oxford: Oxford University Press, 1994; Books XIII-XIV trans. J. Annas, Clarendon Aristotle Series, Oxford: Oxford University Press, 1976. (Collection of treatises centred on the 'science of being', especially substance, form and matter, potentiality and actuality, culminating in theology.)

4 Psychology

Aristotle (*c*. mid 4th century BC) *On the Soul (De anima)*, ed. R.D. Hicks, Cambridge: Cambridge University Press, 1907; Books II-III trans. D.W. Hamlyn, Clarendon Aristotle Series, Oxford: Oxford University Press, 1968.(Application of theory of form and matter to questions about soul and body; perceptio, thought and action.)
Aristotle (*c*. mid 4th century BC) *Short Natural Treatises (Parva naturalia)*, ed. W.D. Ross, Oxford: Oxford University Press, 1955.(Short essays, physiological and psychological, on themes connected with *On the Soul*.)

5 Ethics

Aristotle (*c*. mid 4th century BC) *Nicomachean Ethics (Ethica Nicomachea)* commentary by J.A. Stewart, Oxford: Oxford University Press, 1892, 2 vols; trans. T.H. Irwin, Indianapolis, IN: Hackett, 1985.(Normally regarded as Aristotle's most important contribution to moral philosophy.)
Aristotle (*c*. mid 4th century BC) *Eudemian Ethics (Ethica Eudemia)*, Books I-II trans. M.J. Woods, Clarendon Aristotle Series, Oxford: Oxford University Press, 1982.(Similar in content to the *Nicomachean Ethics*, though different in important details. Normally regarded as an earlier version of Aristotle's ethical theory.)
Aristotle (*c*. mid 4th century BC) *Great Ethics (Magna moralia)*, trans. G. Stock, in *The Complete Works of Aristotle*, revised Oxford Translation, ed. J. Barnes, Princeton, NJ: Princeton University Press, 1984, 2 vols, 1868-1991.(The standard English translation of the whole corpus; contains the revised Oxford Translation.)

6 Politics

Aristotle (*c*. mid 4th century BC) *Politics (Politica)*, ed. W.L. Newman, Oxford: Oxford University Press, 1887-1902, 4 vols; Books I-II trans. T.J. Saunders, Clarendon Aristotle Series, Oxford: Oxford University Press, 1995.(Aristotle's major work in political theory, including ethics, history and sociology; examines the imperfections of actual states and proposes an ideal state.)

Aristotle Commentators

Aristotle's school treatises were given renewed prominence by Andronicus of Rhodes in the first century BC*, and from then on numerous commentaries were written on them. The main modern edition runs to 15,000 pages. They are not just commentaries, but represent the thought and classroom teaching on philosophy quite generally first of the Peripatetic (that is, Aristotelian) school, and then of the Neoplatonists between* AD *200 and 600, with further activity from the ninth century in the Islamic world and from the eleventh in the Byzantine.*

The commentary movement followed and is commonly thought to have been inspired by the work of Andronicus of Rhodes, who, perhaps around 60 BC, began a massive study of Aristotle's writings (see Aristotle). Of the extant commentaries, the earliest come from Peripatetics of the first half of the second century AD, Adrastus and Aspasius. The early commentaries culminate in the work of the greatest Peripatetic elaborator of Aristotle, Alexander of Aphrodisias (second to third century; see Peripatetics). But the later commentaries by Themistius (fourth century), though presented as mere paraphrases, and though informed by certain Neoplatonist developments, are similar in content to those of Alexander.

Outside the Peripatetic school, the chief interest in the first century BC and the first two centuries AD focused on Aristotle's *Categories* (see Categories §1; Aristotle §7). Under the influence of the Neoplatonist Porphyry (third century), who rejected the complaint of his teacher Plotinus Aristotle's *Categories* ignores the Platonic Forms, Aristotle's logic and a wide selection of his other texts became a standard prerequisite for studying Plato in the Neoplatonist schools, Neoplatonism being by then the dominant philosophy (see Neoplatonism).

Porphyry's insistence on the harmony of Plato and Aristotle inaugurated a Neoplatonist tradition. His pupil Iamblichus (third to fourth century) and Iamblichus' pupil Dexippus further defended the compatibility of Aristotle's *Categories* with Plato's theory of Forms, and Iamblichus is even said to have denied that Aristotle contradicted the theory of Forms at all. In fifth-century Alexandria, first Hierocles and then Ammonius, son of Hermeas represented Plato and Aristotle as agreeing that god was the artificer of a beginningless universe. This harmonization, though historically untenable, proved philosophically fruitful, producing a new amalgamation of the ideas of Plato and Aristotle.

After Iamblichus, the study of Aristotle as a propaedeutic to Plato acquired a new significance, because the study of Plato himself was seen as leading to the Neoplatonist ideal of ascent to god. In Iamblichus' Platonic curriculum, Plato's *Timaeus* and *Parmenides* were put last, and seen as theological treatises describing the supreme divinities. From Ammonius onwards formalized introductions were prefixed to commentaries on Aristotle's *Categories*, the first Aristotelian work in the curriculum. The introductions covered ten points which, we are told, had been made standard by Ammonius' teacher Proclus (fifth century), one of them being that the eventual aim of studying Aristotle is ascent to god through the theological works of Plato. Even before the *Categories*, the curriculum included Porphyry's introduction to the *Categories*, known as the *Isagōgē* or *Quinque Voces*. Commentaries on that work were prefaced by a description of the nature of philosophy.

The commentaries of the Alexandrian Neoplatonist school after Ammonius are sometimes divided into portions which would have taken an hour to deliver as lectures. Often there is a double discussion, a *protheōria* or treatment of Aristotle's doctrine in a passage, followed by an exegesis of the exact wording of the text (*exēgēsis tēs lexeōs*).

In Alexandria, the Christian Platonist Philoponus (490-570s) worked out a complete alternative to the Aristotelian physics which the Neoplatonists had accepted, and thus went on to influence the development of Islamic and Western physics. Many of his unorthodox ideas were included in his attack *Against Proclus*, published in 529, but he also began to introduce them into his commentaries on Aristotle. Meanwhile Simplicius, a pious devotee of Neoplatonist religion, had left Athens for Persia as one of the seven displaced Athenian philosophers after the Christian emperor Justinian closed the Athenian Neoplatonist school in 529. He wrote bitterly about Philoponus' Christianity and about the unorthodox interpolations in his commentaries. He emphasizes the harmony of virtually all Greek thought, partly in order to rebut Christian charges of contradictions. It has been suggested that Simplicius finished up in Ḥarrān, just within the borders of modern Turkey, and wrote his Aristotelian commentaries there after 532. It was from Ḥarrān that Thābit ibn Qurra later went, to found the Platonizing school in Baghdad. This

school became the driving force behind the translation into Arabic of Aristotle and his commentators in the ninth century, which was to inspire new philosophizing in the Islamic world.

Meanwhile commentaries were made available in Latin by Boethius (died *c.*525), but only on two logical works of Aristotle and on Porphyry's introduction (*Isagōgē*) to that logic. The Alexandrian School may have survived until the Arab capture of the city in 642, and a tradition continued in Constantinople. There in the twelfth century the princess Anna Comnena organized a circle that included the commentators Eustratius and Michael of Ephesus, whose commentaries were completed in 1138 or later. It may have been from Michael's workshops that James of Venice was able, around 1130, to collect Greek commentaries for translation into Latin. In the same century, Gerard of Cremona was translating Aristotelian commentaries into Latin from the Arabic versions. During the next century, the process of transmission from both languages to the Latin-speaking world turned from a trickle into a flood, and Thomas Aquinas was a beneficiary of this development. He was thus responding not just to Aristotle, but to Aristotle transformed by the ancient commentators.

The commentaries embed fragments from all 1,150 years of ancient philosophy from 550 BC to AD 600, notably those of the Presocratics. And many ideas which were previously thought to date from later times can actually be traced back to the commentators. In dynamics, the idea of an impetus, which in its medieval context has been hailed as a scientific revolution, can be seen to have travelled by an Arabic route from the sixth-century commentator Philoponus. Galileo in his early works mentions Philoponus more often than he mentions Plato. And Brentano in the nineteenth century got from the commentary tradition, and not from Aristotle himself, his idea that all activity of the mind is directed towards intentional objects.

Arithmetic, philosophical issues in

The philosophy of arithmetic gains its special character from issues arising out of the status of the principle of mathematical induction. Indeed, it is just at the point where proof by induction enters that arithmetic stops being trivial. The propositions of elementary arithmetic - quantifier-free sentences such as ' $7 + 5 = 12$*' - can be decided mechanically: once we know the rules for calculating, it is hard to see what mathematical interest can remain. As soon as we allow sentences with one universal quantifier, however - sentences of the form '* $(\forall x)f(x) = 0$*' - we have no decision procedure either in principle or in practice, and can state some of the most profound and difficult problems in mathematics. (Goldbach's conjecture that every even number greater than 2 is the sum of two primes, formulated in 1742 and still unsolved, is of this type.)*

It seems natural to regard as part of what we mean by natural numbers that they should obey the principle of induction. But this exhibits a form of circularity known as 'impredicativity': the statement of the principle involves quantification over properties of numbers, but to understand this quantification we must assume a prior grasp of the number concept, which it was our intention to define. It is nowadays a commonplace to draw a distinction between impredicative definitions, which are illegitimate, and impredicative specifications, which are not. The conclusion we should draw in this case is that the principle of induction on its own does not provide a non-circular route to an understanding of the natural number concept. We therefore need an independent argument. Four broad strategies have been attempted, which we shall consider in turn.

1 Formalism

Although the problem of accounting for both the objects apparently spoken of and the knowledge we appear to have about them in a way that explains both the apparent necessity and the apparent applicability of this knowledge is one which arises for all areas of mathematics, arithmetic has features which make some answers to the question seem especially plausible. In the language we use to express arithmetic every number has a canonical name (called a 'numeral'). This fact has made formalism a persistently attractive option in the case of arithmetic: since every number has a numeral to represent it, we can restrict our attention to the symbols and let numbers themselves drop out of the account entirely. It is not clear that this move helps very much with the epistemological part of the problem, since if the account is to license the whole of arithmetic, numerals will have to be abstract entities our knowledge about which demands explanation. But in any case formalism as just described is untenable, since it leaves the applicability of arithmetic wholly unexplained: we cannot rest content with the claim that arithmetic is just a game with symbols and not demand an account of why it should be *this* game that we play rather than any other.

If the fault in formalism is that it does not allow arithmetical statements to be meaningful, it might be thought an improvement to regard the terms occurring in our formal theory as being given their meaning by the role they play in the axioms of the theory. This variant of formalism has been advanced as an account not just of Peano's axiomatization of arithmetic but of the axiomatic method generally (most famously by Hilbert in his correspondence with Frege; see Frege 1980). It is far from clear, however, that the terms of a formal language can be invested with meaning this easily. In the 1920s and 1930s the members of the Vienna Circle (most notably their 'logician-in-chief', Rudolf Carnap) regarded arithmetic as true only 'by convention'. But if we were to adopt an inconsistent convention our language would be incapable of saying anything about the world. The general point, then, is that formalism cannot explain applicability without assuming consistency, and the most obvious sort of proof of the consistency of arithmetic appeals to our prior grasp of an infinite model, thus facing again the very difficulty formalism was intended to solve.

In his later work Hilbert had the idea of partitioning arithmetic into a real part, for which he gave a finitistic justification (see §3 below), and an ideal part, to be treated formally and justified instrumentally as a method of providing shorter or more comprehensible proofs of results in the real part. The consistency problem arises once more, of course, but Hilbert hoped to be able to solve it without supplying a model, by a combinatorial analysis of the syntax of the formal language. Such an analysis could, he thought, be carried out using the conceptual resources of the finitistically justified real part. Gödel's incompleteness theorems coupled with Turing's analysis of the notion of computability killed Hilbert's programme in the grand form originally envisaged. However,

mathematicians hardly ever exploit the full strength of the classical system and not everyone has given up hope of an instrumental justification on Hilbertian lines of the parts they actually use (see Gödel's theorems §6; Hilbert's programme and formalism §4; Turing, A.M.).

2 Empiricism

If objections to formalism lead us to believe that arithmetical statements really are *true*, we might try Mill's strategy, which treats numbers as empirical and arithmetical statements as empirical generalizations (see Mill, J.S. §3). This strategy has not been popular - our conviction that the hardness of the logical 'must' applies in arithmetic too seems difficult to dispel - but it is quite difficult to refute decisively. Frege objected to it on the grounds that if numbers were empirical, only what is empirical could be counted, whereas number, in Locke's phrase, 'applies itself to men, angels, actions, thoughts - everything that either doth exist or can be imagined' (1689: II.xvi.1). This is not, however, a decisive objection, since the empiricist may be prepared to accept that 'everything that doth exist or can be imagined' is ultimately explicable in empirical terms. A better objection is that empiricism seems ill-equipped to ground our knowledge about large numbers (for example, those larger than the number of atoms in the observable universe). Even though such numbers are practically useless (which is precisely why empirical evidence provides no confirmation for assertions about them), the revision to arithmetic which would be needed if we did not admit them is radical and the resulting system would be awkward to use. The most persuasive objection of all, however, is the difficulty the arithmetical empiricist has in justifying the principle of mathematical induction. It is very hard to see what would count as empirical evidence either for or against this principle.

3 Intuitionism

A third broad strategy is to appeal to intuition to explain how arithmetical knowledge is possible. This approach is due to Kant, whose account of arithmetic parallels quite closely his account of geometry. A geometric proof typically begins with a construction (of a triangle, for instance), on which various operations are then performed. Since I construct the triangle in intuition, Kant held that it will be subject to just the spatial structure which sensibility imposes on all my experience. As a consequence, the geometric theorem I prove by this means is applicable a priori to experience. Similarly, in order to prove that $7+5=12$ I must first construct the concept 'seven' in intuition and then perform on my construction various operations. What is less clear in the arithmetical case than in the geometric one is how the structure imposed by sensibility - what Kant calls the 'form' of intuition - constrains the construction. Kant admits that we do not depend on sensibility for the *concepts* of arithmetic, which are therefore purely intellectual in contrast to those of geometry, but he holds that constructing the concepts depends on counting, which is a process apparently subject to the forms of space and time. It was common in the nineteenth century to read Kant as advocating a neat parallelism - that arithmetic is the science of time just as geometry is that of space - but this is at best a simplification. It is in any case far from clear that counting depends on time. Notice, though, that if we abandon this dependence we thereby give up just what Kant saw as the principal advantage of his account, namely its explanation of the applicability of arithmetic. The moral is quite general: the appeal to intuition beyond the limits of logic, which is characteristic of Platonism, does nothing to explain the applicability of mathematics when it is removed from the Kantian framework (see Kant, I. §5).

If I assert an arithmetical proposition, I am, according to Kant, reporting the result of a mental construction which I have performed or could in principle perform. But as Frege said, 'another man's idea is another idea'. Kant's account makes '$7+5=12$' express a different statement on each person's lips. It is therefore unavoidably solipsistic.

A further difficulty is caused by Kant's insistence that sensibility is passive and that the intuitions it supplies are immediate representations: it is hard to believe that I can have in my mind an *immediate* representation of a very large number, such as 10^{100}. The notion (denied by Kant) that humans are capable not only of passive intuition through the faculty of sensibility but also of creative - Kant calls them 'intellectual' - intuitions is a theme of German romanticism in the nineteenth century. In application to arithmetic it was used by Brouwer to provide an account on which our experience of time unfolding gives us an intuition of succession - what Brouwer calls the bare two-oneness - which we can repeat for ourselves at will as creative subjects. On this view the law of the excluded middle is not justified: if numbers are mind-dependent and have no existence outside of our constructions, then, for example, there is no reason to believe that Goldbach's conjecture (that every even number greater than 2 is the sum of two primes) must be either true or false in advance of constructing either a proof or a

counterexample.

Hilbert's justification for the real part of his real/ideal partition mentioned in §1 above proceeds on similar lines to Brouwer's, although the intuitions on which numbers are based are for Hilbert those of finite arrangements of concrete objects. For this reason Hilbert's account seems less likely than Brouwer's to descend into solipsism. But the principal difference between their conceptions is that Brouwer regarded arithmetical statements and proofs as mental constructions available within arithmetic in the same way as numbers themselves. For Hilbert, on the other hand, any application of arithmetic to proofs is a matter for the metatheory. The result is that Hilbert's finitism can justify directly only a fragment of arithmetic with a limited induction principle (so-called primitive recursive arithmetic), whereas Brouwer's intuitionism has a much stronger induction principle available to it.

There is a persistent worry, however, as to whether either Hilbert or Brouwer overcame the problem Kant's account faced with large numbers. Both were ready to accept arguments on the basis of what humans can do in principle: these arguments seem to turn on a distinction between finite and infinite which is not available from their perspective without independent justification. If so, their position collapses into 'strict finitism', the view that we cannot have a general grasp of the notion of arbitrarily large finite numbers.

4 Logicism

The last strategy, the formulation of which is due to Frege, is to show that arithmetical truths are logical. One way of doing this is to postpone the attempt to explain the substantival use of number-words and to explain instead their adjectival use. This can be done by defining not the numbers themselves but the numerically definite quantifiers:

$$\exists^0 xFx \equiv_{\mathrm{Df}} {\sim}\exists xFx$$

$$\exists^{n+1} xFx \equiv_{\mathrm{Df}} \exists x(Fx \wedge \exists^n y(Fy \wedge y \neq x)).$$

From these definitions we can prove logically that, for example,

$$\exists^7 xFx \wedge \exists^5 xGx \wedge \exists^0 x(Fx \wedge Gx) \supset \exists^{12} x(Fx \vee Gx),$$

which we can interpret as being what is meant by '$7+5=12$'. By the same means we can generate the whole of the positive part of elementary arithmetic, that is, the true quantifier-free equalities. What we cannot generate is the negative part, that is, the true inequalities. For this we would need a guarantee, which logic alone cannot supply, that there is no finite bound to the number of objects that there are. (Wittgenstein in the *Tractatus* (1922) proposed a rather more general variant of the same strategy, but it seems to be susceptible, in the context of Wittgenstein's system, to just the same difficulty over proving inequalities.)

Frege considered the introduction of numbers via numerically definite quantifiers in his *Grundlagen* (1884). What led him to reject it was not the difficulty of deriving inequalities but a problem facing not just this but any strategy involving implicit definitions, namely that such definitions do not fully determine the identity conditions of the objects they attempt to introduce. This is nowadays known as the Julius Caesar problem because Frege posed it by asking how one could tell from the implicit definitions whether or not Julius Caesar is a number. In the present context this question creates a problem not for the project of explaining the adjectival use of number-words but for the strategy of explaining their substantival use in *terms* of their adjectival use. The problem bites, therefore, only when we attempt to move beyond elementary arithmetic and quantify over numbers.

Another logicist strategy considered and rejected by Frege, but the subject of renewed attention at the end of the twentieth century, is to derive arithmetic from the 'numerical equivalence', that is, the contextual principle (sometimes called 'Hume's principle' or '$\mathrm{N}=$') that the number of *F*s is the same as the number of *G*s if and only if the *F*s and the *G*s can be correlated one-to-one. As a technical programme this is perfectly feasible, as Frege was the first to realize. He sketched in the *Grundlagen* a construction of the natural numbers and a proof that they satisfy Peano's axioms, assuming only second-order logic and the numerical equivalence. He nevertheless rejected the strategy of basing arithmetic on this equivalence because the Julius Caesar problem applies to it as much as to the previous contextual strategy. Interest in the strategy has been revived by Crispin Wright, who argued (1983) that the Julius Caesar problem can be solved by appeal to an independently plausible 'sortal inclusion principle' to the effect that objects must be of different sorts if the content of their identity conditions is sufficiently different.

The proposal Frege settled on instead was to define the number of *F*s explicitly as the class of all concepts

equinumerous with *F*. He showed in *Grundgesetze der Arithmetik* (1893-1903) that on this definition of number arithmetic can be deduced from what he took to be logical principles. (One of his allegedly logical principles was inconsistent, however, and subsequent attempts - most notably by Whitehead and Russell - to repair Frege's system have had to appeal to principles even their advocates have baulked at calling logical.)

Frege's solution to the Julius Caesar problem (the underdetermination of the objects of arithmetic by the principles about them to which we are committed) is in any case under threat from the opposite problem: any non-arithmetical determination of the objects which solves the Julius Caesar problem will give numbers extra properties which, since they do not flow from the principles governing numbers, must be arbitrary and hence spurious. This problem was mentioned by Dedekind (in a letter to Weber dated 24 January 1888; see Ewald 1996), but it has come to prominence more recently through a much-cited paper by Benacerraf (1965). Two ways of dealing with it have been advanced under the generic label of 'structuralism'. Dedekind's way - that we are capable, once we have given a logical construction of one model of Peano's axioms, of abstracting away from its particular features to gain a conception of a model without those features - appeals to a mental process (abstraction) that many have found mysterious. Benacerraf's way - that arithmetic should be seen as the study not of one particular model of Peano's axioms but of the structure which all such models have in common - is in danger of relapsing into the axiomatic formalism we considered earlier.

What Russell's paradox has suggested to Michael Dummett is that the concept 'set' is what he calls 'indefinitely extensible' (see Dummett 1991; Dummett, M.A.E. §3). This means that any attempt to regard the objects falling under the concept as forming a definite totality leads inevitably to the realization that there are other objects not in the totality which we are nevertheless forced to admit as falling under the concept. Dummett holds that the presence of 'indefinitely extensible' concepts is a characteristic feature of mathematics which should lead us to espouse for it the anti-realism which his more general meaning-theoretic arguments make room for. He recommends that we abandon the law of the excluded middle and espouse the mathematics of intuitionism but not Brouwer's solipsistic conception of its objects. Dummett thinks that in this way we can retain Frege's logicist insight that numbers are abstract objects truths about which embody deductive subroutines whose application to the world is validated by logic alone.

Just as Brouwerian intuitionism has been accused of an instability which reduces it to strict finitism, not everyone is persuaded that Dummett's position does not collapse into the ultra-intuitionism of middle-period Wittgenstein, according to which the meaning of an arithmetical generalization is identical with its proof. On this view Goldbach's conjecture does not in the present state of knowledge have any meaning at all.

Armstrong, David Malet (1926-)

David Armstrong was born in Melbourne, and studied philosophy at the Universities of Sydney and Oxford. He returned to Australia to teach at the University of Melbourne and later moved to the chair at Sydney. He has made many major contributions to central topics in epistemology and metaphysics, including perception, laws, universals, the mind, belief and knowledge, and possibility. His overall programme has been the articulation of a naturalistic metaphysics, understood as the doctrine that nothing at all exists except the single world of space and time.

A notable feature of his work in these contentious areas has been its directness and clarity, and the central importance he attaches to squaring what the philosopher says with what science, especially physical science, teaches us. In both these respects he is like another important Australian philosopher, J.J.C. Smart, and together they have influenced the way a generation of philosophers in Australia do philosophy, as well as influencing the doctrines they espouse.

1 Biography

David Armstrong was born in 1926 in Melbourne, Australia. He studied philosophy at the University of Sydney under John Anderson, a major figure in the history of Australian philosophy. He went to Oxford and took the recently established B. Phil. degree in 1954, taught briefly at Birkbeck College, London, before returning to Australia to teach at the University of Melbourne. He succeeded J.L. Mackie in Anderson's chair at Sydney in 1964. Although he studied at Oxford during the heyday of linguistic philosophy (see Ordinary language philosophy, school of), his work has always been very much in the tradition of the systematic metaphysicians who saw their business as the articulation of a comprehensive picture of what there is, what it is like, and how we know about it.

2 Central state theory of mind

Armstrong is probably best known for his influential *A Materialist Theory of the Mind*. He was originally a Rylean behaviourist but became converted to the identity theory of mind, the theory that mental states are brain states, by John Jamieson Carswell Smart (see Identity theory of mind). The book is a defence of a central state version of the identity theory.

Armstrong argues that the concept of a mental state is the concept of a state that plays a distinctive, causally intermediate role between stimuli, other mental states and behavioural responses. Thus, to give the rough idea, pain is the state that is typically caused by bodily damage, and typically causes a desire that the state cease, a desire that in turn causes a behavioural response that is believed will tend to satisfy this desire and minimize the damage. This account makes good evolutionary sense of why we feel pain by making transparent the survival value of pain. This claim, and the corresponding claims for the other mental states, are put forward as conceptual analyses, and constitute the central state theory of mind. Most of the book is devoted to defending central state analyses of various mental concepts.

On the central state theory, the question of the identity of a given mental state M is the empirical question of what plays the distinctive, causally intermediate role assigned to M by the central state theory. Armstrong observed that in each case it will most likely turn out to be some state or other of the brain that plays the distinctive role, so deriving the identity theory from his central state theory.

Armstrong's central state theory gave a central place to causal connections between mental states as well as to those between stimuli, mental state and response. His theory was thus one of the first versions of functionalism (see Functionalism) though it was not marketed as such.

3 Perception, belief, knowledge

In the early- to mid-twentieth century, the view that perceptual experience is most directly an acquaintance with something mental, and the view that physical objects are some kind of logical construction out of perceptual experiences, were widely entertained (see Perception; Sense data). Armstrong's *Perception and the Physical*

World, published in 1961, defends direct realism - the view that we are directly acquainted with physical reality in perception, and that physical objects exist independently of our experiences. The most distinctive feature of his defence is his analysis of perception in terms of the acquisition of belief. Previous discussion of perception by philosophers had made perception implausibly distinct from what is after all its central function - the acquisition of belief.

Armstrong's treatment of belief follows a suggestion of F.P. Ramsey's that belief is like a map by which we steer (see Ramsey, F.P.). Inside our heads is a master map that moves us through the world in such a way that what we desire is achieved to the extent that the map is correct, and individual beliefs are thought of as sub-maps of the master map. This approach to belief is now the standard alternative to the internal sentence theory of belief (see Belief).

His treatment of knowledge is a version of reliabilism. It is widely accepted that knowledge necessarily involves true belief: if S knows that P, then S believes that P, and it is true that P. But not all true belief is knowledge - the truth of a belief may be a fluke, and flukiness is incompatible with knowledge. Armstrong's suggestion, roughly, is that S's true belief that P is knowledge if it is an empirically reliable sign that P.

4 Universals, laws and possibility

The role of a truth maker plays a central role in Armstrong's metaphysics. If some sentence or proposition is true, there must be something that makes it true; if some predicate applies to something, there must be something that makes it true that the predicate applies. You cannot say that the word 'red' applies to X, and that that is all there is to say. There must be something about X, maybe a relational something, that makes it true that 'red' applies to it.

Armstrong's answer to what makes it true that predicates apply to particulars is a species of realism about universals or properties and relations (see Universals). There are universals, and a predicate applies to X because of the universals that X instantiates. These universals have the following features. They exist independently of the classifications that we find natural; his theory is thus a version of realism, not of conceptualism. Second, they are not to be reduced to sets, or to resemblances between particulars; his theory is not a sort of nominalism. Third, there are no uninstantiated universals. Every universal is possessed by at least one thing; thus his theory is not a platonic realism. Fourth, there is not a distinct universal for each semantically distinct predicate. One and the same universal may, and typically does, make many different predicates true of a particular. His theory is thus a sparse theory of universals. Finally, which universals there are is an a posteriori matter to be settled by total science. Armstrong's theory is thus a version of scientific realism. This highly original theory has established itself as a major position in the debate over universals.

Armstrong's account of laws of nature and of possibility draws on his realism about universals. A long-standing challenge in philosophy has been to distinguish universal statements of the form 'Every F is G' that express laws of nature, are nomic universals, from those that express accidental regularities. 'Every massive body attracts every other massive body' is a law of nature. 'Everyone in this room speaks English' is an accidental regularity (in the sense of not being a law, not in the sense of being a fluke) (see Laws, natural). Armstrong's theory, roughly, is that the laws are the universal statements that correspond to relations of nomic necessitation between universals: 'Every F is G' is a law if being F necessitates being G.

Armstrong's account of possibility is a combinatorial one, drawing on his realism about universals. We can think of how things are as a huge arrangement of particulars and universals. The various possibilities can then be thought of as all the combinations and recombinations of these particulars and universals according to various rules for combining particulars and universals. Thus, to give the barest bones of the idea, suppose that there is in fact mass M at point p, and mass N at point q. What makes it possible that there be mass M at q, and mass N at p? The fact that putting being M with being at q, and putting being N with being at p, do not violate the rules of combination.

Arnauld, Antoine (1612-94)

Antoine Arnauld, a leading theologian and Cartesian philosopher, was one of the most important and interesting figures of the seventeenth century. As the most prominent spokesperson and defender of the Jansenist community based at Port-Royal, almost all Arnauld's efforts were devoted to theological matters. But early on, with his largely constructive objections to Descartes' Meditations in 1641, he established a reputation as an analytically rigorous and insightful philosophical thinker. He went on to become perhaps Descartes' most faithful and vociferous defender. He found Cartesian metaphysics, particularly mind-body dualism, to be of great value for the Christian religion. In a celebrated debate with Nicolas Malebranche, Arnauld advanced something like a direct realist account of perceptual acquaintance by arguing that the representative ideas that mediate human knowledge and perception are not immaterial objects distinct from the mind's perceptions, but are just those perceptions themselves. His criticisms of Leibniz gave rise to another important debate. He also co-authored the so-called 'Port-Royal Logic', the most famous and successful logic of the early modern period. The underlying motives in all Arnauld's philosophical writings were, however, theological, and his greatest concern was to safeguard God's omnipotence and to defend what he took to be the proper Catholic view on questions of grace and divine providence

1 Life and works

Antoine Arnauld was born in Paris on 6 February 1612, one of the many children of an established and well-connected family. He intended to become a lawyer, but the Abbé St Cyran who was spiritual director of Port-Royal (where Arnauld's sister was abbess) convinced him to follow the ecclesiastical life (see Port-Royal). He was ordained and received his doctorate in theology in 1641, and was admitted to the faculty of the Sorbonne in 1643. Most of Arnauld's work throughout his life was theological, devoted to, among other things, an explanation and defence of what he took to be the orthodox Augustinian doctrine of grace and a strict contritionism (see Augustine §5, 7). But he was also responsible for a significant and influential philosophical output, mostly polemical. In 1640, Arnauld was asked by Mersenne to comment upon Descartes' *Meditations*, and his objections were published, with Descartes' responses, as the fourth set in the first edition of the work (1641) (see Descartes, R. §1, 7). The most important of Arnauld's religious works, *De la fréquent communion*, appeared in 1643. This was a defence of the ethical principles of St Cyran and an indictment of what he saw as the indulgent morals of the Jesuits. In the early 1660s, Arnauld co-authored two important works on language and method: the *Grammaire générale et raisonnée* (1660, with Claude Lancelot) and *La Logique, ou l'art de penser* (1662, written with Pierre Nicole, adopting some ideas of Pascal). Better known as the 'Port-Royal Logic', the latter was a treatise on method and reasoning that drew heavily on Descartes' epistemological and methodological doctrines, particularly those found in the *Rules for the Direction of the Mind*.

Meanwhile, Arnauld, as the most prominent representative of the Jansenist movement centred at Port-Royal, continued to be persecuted for his religious views and, like all Jansenists, was suspected of Protestant persuasions and of harbouring politically subversive opinions. In 1656 he was excluded from the Sorbonne for his refusal to submit to the Church on the issue of whether or not Jansenius' *Augustinus* contained heretical propositions. After years of harassment and fearing for his safety, Arnauld left France for the Netherlands in 1679. From there he continued his theological and philosophical polemics. In 1683 he composed *Des vraies et des fausses ideés (On True and False Ideas)*, a philosophical attack upon Nicolas Malebranche's *De la recherche de la vérité (The Search After Truth)*. This was followed two years later by his *Réflexions philosophiques et théologiques sur le nouveau système de la nature et de la grace (Philosophical and theological reflection on the new system of nature and grace)*, in which he addressed Malebranche's theodicy and views on providence and grace. The debate with Malebranche, one of the great intellectual events of its day, continued until the end of Arnauld's life, often in harsh and highly personal terms. He also began a brief but philosophically rich correspondence with Leibniz in 1686 over Leibniz's metaphysical views. Arnauld died in exile in 1694.

2 Arnauld and Descartes

Arnauld's attraction to Descartes' philosophy began early. His objections to the *Meditations* are clearly offered in a constructive spirit by an ally who hopes to see the system move towards greater consistency. Descartes, in fact,

found Arnauld's comments to be the most reasonable and serious of all. Arnauld divided his objections into three parts: the first two dealing with 'philosophical' issues, the third concentrating on 'points which may cause difficulty for theologians'. In the first part, 'The Nature of the Human Mind', he questions Descartes' claim that, since it is possible to form a concept of oneself embodying nothing but the certain knowledge that one is a thinking thing, thought alone constitutes one's essence. The most that can be concluded with certainty from such a premise, Arnauld insists, is 'that I can obtain some knowledge of myself without knowledge of the body'; not, however, that there is a 'real distinction in existence between mind and body'. In the second part, 'Concerning God', Arnauld raises his famous objection to the circularity of Descartes' attempts to draw epistemic warrant from demonstrations of God's existence: 'I have one further worry, namely, how the author avoids reasoning in a circle when he says that we are sure that what we clearly and distinctly perceive is true only because God exists. But we can be sure that God exists only because we clearly and distinctly perceive this. Hence, before we can be sure that God exists, we ought to be able to be sure that whatever we perceive clearly and evidently is true' (Arnauld 1641: 32).

In the final part, Arnauld's most important remark concerns the consequences of Descartes' metaphysics for the Catholic doctrine of Eucharistic transubstantiation. Descartes has emptied the material world of sensible qualities (colour, taste, smell and so on), leaving behind only extension and its properties, modes which necessarily inhere in a substance. His ontology thus appears to Arnauld to be inconsistent with faith, which has traditionally been aligned with the view that the substance of the bread of the Eucharist is either converted into, or annihilated and replaced by, Christ's body, and only the accidents of the bread (colour, taste, smell) remain. Such a real existence of accidents, independent of any underlying substance, is ruled out on Cartesian principles. Descartes responded with one of his tentative reinterpretations of transubstantiation. Ironically, it would be on just this issue of the compatibility of Cartesian metaphysics with the Catholic dogma of the Eucharist that Arnauld would become Descartes' most loyal and vociferous defender over the next fifty years. He generally approved of Cartesianism not just because it seemed closer to the truth than any other system - especially the Aristotelian - but also because its doctrines were the most supportive of Christian piety. Arnauld believed that Descartes 'has demonstrated the existence of God better than anyone else', and that his mind-body dualism has laid the surest foundation for the immortality of the soul.

3 The Arnauld-Malebranche debate

In 1680, Arnauld came across the manuscript of Malebranche's *Traité de la nature et de la grace (Treatise on Nature and Grace)*, which was in the process of being printed. He was so astounded by what he read there that, unable to halt its publication, he decided to publicly refute Malebranche's entire system. His ultimate target was Malebranche's views on grace and on God's general *modus operandi*. But he chose to begin his attack by undermining what he took to be the philosophical foundations of Malebranche's theology. Thus, in 1683 he published *Des vraies et des fausses idées*, an attack on Malebranche's theory of ideas as presented in his most important philosophical work, *De la recherche de la vérité* (1674-5) (see Malebranche, N. §§2, 3, 6).

Malebranche had argued that ideas, the immaterial representations present to the mind in perception and knowledge, are not themselves modes of our thought, as sensations are, but are the very archetypes or essences of things in God's mind, to which we have access through a kind of divine illumination or union with God.

Like most seventeenth-century philosophers, Arnauld believed that representative ideas play an essential role in human cognition. His objection was to thinking of ideas as image-objects in their own right, independent of the mind and mediating its access to the external world. Malebranche's view, he alleged, is a result of the same confusions that gave rise to the Aristotelians' 'sensible species'. As children, we wrongly assume that the images or reflections through which we sometimes see things not actually before the eyes are themselves objects, and later come to suppose that it is through similar image-objects that the mind thinks of things in their absence. But philosophers have realized that even in ordinary sense-perception the material bodies before the eyes are not immediately present to the soul. They conclude that in sense-perception what is directly perceived are representative beings rather than bodies themselves. This line of reasoning, Arnauld argues, treats the soul as if it were material, assuming that the way the senses work and the way the mind works are analogous. More importantly, a theory that makes ideas into mind-independent entities mediating cognition of the world has the absurd consequence that we never know or perceive that world: all we ever perceive are ideas. The mind is surrounded by a 'palace of ideas' that keeps it from the world of things that God intended it to know. Malebranche

‘transports us to unknown lands… where a man sees, instead of the men toward whom he turns his eyes, only intelligible men; instead of the sun and the stars which God has created, only an intelligible sun and intelligible stars’ (Arnauld 1683: 227-8). Even Malebranche must reject such extreme Pyrrhonism (see Pyrrho; Pyrrhonism).

Arnauld goes on to argue that the ideas that function in human perception and knowledge are not ‘representative beings distinct from the mind’s perceptions’, but just *are* those perceptions: ‘I take the idea of an object and the perception of an object to be the same thing’ (1683: 198). To have an idea of a thing just is to perceive or think of that thing; it is not to have some proxy object standing before the mind. The idea is a mental act or operation which, through its ‘form’ (a term borrowed from Descartes, who defines an idea as the *forma cogitationis*), is directed at some object but which is not itself the object of perception. One can thus characterize a thought through its object (for example, as the idea of the sun) by attending to its form, or one can consider it simply as an act or mode of the mind:

> I have said that I take the perception and the idea to be the same thing. Nevertheless, it must be remarked that this thing, although single, stands in two relations: one to the soul which it modifies, the other to the thing perceived, in so far as it exists objectively in the soul. The word *perception* more directly indicates the first relation; the word *idea*, the latter.
>
> (Arnauld 1683: 198)

There is still a sense in which we perceive material objects only mediately or indirectly, since we perceive a thing through the form of the perceptual act (that is, through the idea of the thing). But it does not follow from this that we perceive things indirectly in the strong and unacceptable sense of ‘indirect’ entailed by Malebranche’s account.

In Arnauld’s eyes, then, his debate with Malebranche over the nature of ideas pitted something like a direct realist account of perceptual acquaintance with Malebranche’s representationalist or indirect realist account. But the debate is also a rich source for early modern theories of intentionality (see Intentionality). Arnauld claims that it is not his intention to do away with all representative beings, since he grants that the mind’s modifications are themselves representative of objects. This, in fact, is how his act-ideas achieve their relatedness to objects (the second relation in which every idea stands). Every perception is the perception *of* something because it has a representational content (what Arnauld, again following Descartes, calls its ‘objective reality’) and thus is representative of some object: ‘The perceptions that our soul has of objects are necessarily representative of these objects’ (Arnauld 1684: 381). This representative character is an intrinsic feature of the perceptual act and is what gives the act its intentionality, or directedness-towards-an-object. And for Arnauld this is true for every mental event - not just clear and distinct perceptions, but also sensations and passions. Malebranche, by contrast, claims that only intellections have intentionality, and their intentionality is explained by the real presence to the mind of some distinct object which the mind apprehends - that is, a divine idea - and not by some features intrinsic to the mental operation itself.

Arnauld also directed his considerable critical skills to the doctrine of the vision in God. Much of his concern was focused on Malebranche’s claim that our ideas of extended beings, or the idea of extension itself (what Malebranche calls the ‘infinite intelligible extension’) are in God. He suspected that this was tantamount to placing extension itself really or ‘formally’ in God and thus making God extended or material, and that Malebranche’s doctrine harboured a latent Spinozism or Gassendism (see Spinoza, B. de §4; Gassendi, P. §4). Arnauld accused Malebranche of distorting the thought of both Descartes and Augustine - whom Arnauld and Malebranche alike took as their mentors - and even of propounding anti-Cartesian, anti-Augustinian and anti-Christian views.

The clash over representative ideas - which continued until Arnauld’s death - was only supposed to be a preliminary, however, for the real issue: God’s manner of acting in the realms of nature and grace. Malebranche, in his theodicy, had argued that evil and sin occur because God acts only by what he calls ‘general volitions’ - volitions that carry out general and simple laws. God would like to forestall evil and to save every human being, but actually to do so would require a great number of *ad hoc*, particular volitions and would demand that God should violate the principles of his own nature, which determines him to carry out his plans by the wisest and most simple means. So God must *allow* imperfections in the world and the damnation of many (see Malebranche, N. §5).

Arnauld objected strongly to this model of God's activity. He accused Malebranche of undermining God's omnipotence and of treating God's agency no differently from human agency. He insists that, on Malebranche's account, God is like some distant king who only issues general edicts and has no concern over how his kingdom is run in its details. Such a picture threatens the true Catholic system of divine providence and removes God from direct governance of the world. Moreover, Arnauld rejects any attempt to limit God's absolute power, even if that limit comes from God's own nature. God's absolute freedom is the freedom of a will that determines itself and wills with a complete indifference.

Many of Arnauld's criticisms of Malebranche are rooted in his Jansenism. For it is clear that what really bothers Arnauld is the notion that God could will something (for example, that all humans should be saved or that the world should be without evil) and the object of his will not obtain, that is, that a divine volition might not be efficacious. For Arnauld, all God's volitions are necessarily efficacious, and if God had willed that all humans should be saved - and this claim is, by itself, unacceptable to Arnauld - then all humans would have been saved.

4 Correspondence with Leibniz

This same concern for safeguarding God's omnipotence and freedom is also apparent in Arnauld's critical remarks on Leibniz's metaphysics. In 1686, seeking to enlist Arnauld's support for his ecumenical project of bringing about a reconciliation of the Catholic and Protestant faiths, Leibniz sent a summary of his *Discours de la métaphysique* to Arnauld. Among the propositions upon which Arnauld focused was one related to Leibniz's notion of substance: that the individual concept of every person involves, once and for all, everything that will ever happen to them. Arnauld responded by saying that if that is so, then 'God was free to create or not to create Adam, but supposing he decided to create him, all that has since happened to the human race or which will ever happen to it has occurred and will occur by a necessity more than fatal' (Montgomery 1980: 73). God, having chosen to create Adam, therefore has no freedom or control over the course of events that constitutes the history of the world, since it all apparently follows necessarily from the concept of the first human. Arnauld suggested that Leibniz should cease such metaphysical speculations and think seriously of the condition of his soul and of entering the fold of the Catholic Church. Fortunately their correspondence continued, and Arnauld's objections and queries - concerning necessity, divine providence, causality, the being of possibles, the nature of individual essences and the distinction between essential and accidental properties - led Leibniz to think more deeply about many of his doctrines, and were certainly of great importance in the development of Leibniz's mature metaphysics (see Leibniz, G.W. §1, 4, 6-7).

Art and morality

A complex set of questions is raised by an examination of the relationship between art and morality. First there is a set of empirical considerations about the effect that works of art have on us - one obviously contentious case is that of pornography. Many would argue that the artistic merits of a work are independent of any attitudes or actions it may lead us to adopt or perform. This claim does not survive scrutiny, however, though there is a distinction to be drawn between artistic value and the value of art as a whole. Though there are no coercive arguments to show that we have to take into account the moral qualities of works of art, it is in practice very difficult to ignore them, especially when the point of the work is insistently moral, or when the work is conspicuously depraved.

There is a long tradition, dating back toPlato, of regarding art with suspicion for its power over our emotions, and much of Western aesthetic theorizing has been a response to Plato's challenge. The longest-lasting defence justified art in terms of a combination of pleasure and instruction, though the two never hit it off as well as was hoped. In the early nineteenth century a new, more complex account of art was offered, notably byHegel, in the form of a historicized view in which art is one of the modes by which we come to self-awareness; the emphasis altered from truth to an independently existing reality to truthfulness to our own natures, as we explore them by creating art. Taken into the social sphere, this became a doctrine of the importance of art as an agent of political consciousness, operating in subtle ways to undermine the view of reality imposed on us by the ideologies that hold us captive.

1 The range of issues

The relationship between art and morality is the most fraught and complex in the philosophy of art. One reason for this is that, from Plato onwards, several key issues have not been adequately distinguished. For instance, one important question concerns the effect of works of art on the audience, which is an empirical matter. Does pornography, for example, inflame sexual drives or does it provide substitute gratification? Or does it have different effects on different people (the most plausible answer)? Philosophers, and many others, tend to argue about this question on the basis of nothing more than perfunctory introspection. A separate question is whether works of art should be designed to have moral effects, and if so, how best that can be achieved. The major tradition of Western criticism, from Aristotle to the end of the eighteenth century, has been that literary works should at least aim to instruct as well as delight, and a great deal of debate has been occupied with the relationship between the two goals. This discussion has been complicated, if not bedevilled, by Plato's postulation of the supreme trinity of forms: truth, beauty and goodness. If everything is to be allotted to one of these categories, it would seem that the object of art is beauty. But is it the case that all successful works of art are beautiful? It would seem that, unless one made it a matter of definition that they are, many clearly are not, including some of the greatest. This is especially the case with tragedies, where pain, evil and death predominate. Many artists have evidently felt it their duty to portray reality as vividly as possible, feeling an allegiance to truth rather than beauty. The characteristically philosophical hope that the three categories ultimately coincide seems to be more a case of wishful thinking than of rigorous argument. Nietzsche, in a late unpublished note, put the counter-position with typical incisiveness: 'For a philosopher to say, "the good and the beautiful are one", is infamy; if he goes on to add, ''also the true", one ought to thrash him. Truth is ugly.'

It is already clear that profound and very difficult questions proliferate in this area. It is tempting to hold them in check by postulating a kind of experience that is 'purely aesthetic', then to consider further matters, especially that of the relationship of art to morality, as separable issues. But examples of purely aesthetic experience are less common, it turns out, than might be hoped. And it is unclear what a purely aesthetic experience of, say, *King Lear* would be. Would it be a concentration on the form of the play without regard to its content? But what would that mean? It is unclear that in any of the cases which really bother us a distinction of that kind can be made. A related question asks whether there can be works of art that express strikingly uncouth worldviews. For example, is it a contingent matter that no great Nazi art was produced? And if it is not, how much light does that cast on the relationship between art and morality? And what of works that have an admirable moral content or message, but are of low aesthetic merit, such as Harriet Beecher Stowe's *Uncle Tom's Cabin*? Does that indicate something about the moral content itself, as some have held, or only about the author's lack of talent?

If art is not to be divorced from all other human activity - such a position is known as 'aestheticism', but has never been clearly stated - then the question of its place in the economy of human concerns is clearly crucial. After the effective demise of the classical tradition, the most striking series of attempts to relate art to our other endeavours has been that of the Idealist philosophers. These attempts begin with Hegel and continue at least as far as R.G. Collingwood (§3), and include the politically motivated theorists who stand in a complicated relationship to those earlier philosophers, and who have seen art as a mode of articulating our responses to a reality which we are at least in part responsible for creating. The stress has moved, consequently, from imitation to expression; from the registration of the way we find the world to the expression of our attitude towards it; and thus to sincerity, a term that connects truth and genuineness, and in assorted ways puts art at the centre of our moral experience, and vice versa.

2 The empirical issue

It is often plausibly said that totalitarian regimes take art more seriously than democratic ones. Whatever one's attitude to censorship, it shows at the least that art is felt to have an influence on people's behaviour. And in practice there are virtually no societies in which some form of censorship is not operated. Democracies pride themselves on not prohibiting art, but only various objectionable forms of entertainment or propaganda. It is not clear, however, that the definitions drawn here are more than terminological. 'Art' often has an honorific connotation, so that anything sufficiently degraded is allotted a separate category, such as 'pornography'; 'erotic art' is then claimed to be that which has sexual content but is not arousing (see Erotic art). This is all very suspicious. What it seems to show is that everyone agrees that there are artefacts with a *prima facie* claim to artistic status which can also be arousing, or can incite racial hatred, etc. If one simply decrees that in so far as they have effects on attitudes and behaviour they are not art, or that these effects are irrelevant to their artistic status or stature, this seems an easy way with a hard question. That some works of art have drastic practical effects seems undeniable: a notorious case was Goethe's *The Sorrows of Young Werther*, which led to a wave of romantically inspired suicides. That fact is not used to discredit the book now, though if a contemporary work were to have the same effect it undoubtedly would.

What remain perennial sources of dispute are those works which have a strong emotional effect, but which make it difficult for us to decide, on account of their complexity, how they influence our outlook and thus our conduct. This lies at the centre of the long-lasting debate about the effect of tragedy (see Tragedy). It seems strange that we should be unable to decide whether tragedies of great power, such as *Oedipus the King*, exalt, devastate, bewilder, affirm or question basic values, and so on. Yet all these positions are held and argued about with passion. That the issue remains so contentious is no doubt partly due to the fact that there is often a discrepancy between how they make us feel and what we think they ought to make us feel, and that it is difficult to keep in focus, after the immediate experience of such works, what we actually did feel. As any experience of great complexity recedes, we are apt to simplify its effect on us, especially if we are in the grip of a gratifying theory. The only thing that can be confidently asserted in this area is that there is no doubt that some works of art have moral (and of course political) effects.

3 Artistic value and the value of art

Although works of art do have moral effects, it has been argued that it is not part of their value that they do. It was largely in reaction to the oppressive moralism of Victorian criticism that Wilde remarked that there are no such things as moral or immoral works of art. And it is widely agreed (though not universally) that art which, in Keats' words, 'has palpable designs upon us' is inferior. But that does not mean that the moral effects of art are irrelevant to its value as art, only that it is less likely to achieve them if they are crudely manifest. Nor does the oft-cited fact that those who frequent art are not conspicuously better than those who do not have any cogency. It is very difficult to improve people and failure to do so may reflect more on people than on the attempt. Further, to claim that art in some cases derives its value from its moral qualities is not to claim that they are invariably relevant. It is not easy to envisage a plausible argument to show that much instrumental music or painting has moral properties or effects; and the same is true of a considerable amount of literature. The claim, made by Tolstoy, that art is only valuable in so far as it has a beneficial influence on people's behaviour, cannot be refuted, but equally cannot be established. It is an attitude one might choose to adopt, but it would certainly eliminate a great deal of what is normally called art. It might be claimed that any interesting aesthetic theory will do this, and that what matters is

how radical we are prepared to allow an aesthetic theory to be. Any theory that rules out much of what is widely valued, either on the ground that it is not art at all, or that it is bad art, risks appearing ridiculous.

There is a certain amount of art (not a great deal, but a significant amount) which takes the form of something approaching a parable. Tolstoy's great short story 'How much land does a man need?' is a good example. In such cases it is hard to say that someone could appreciate it without grasping its moral point. To confine oneself to admiration for its economy, tension, verve, but not to recognize the end those qualities serve would be to fail to recognize a realized intention. Similarly, in a rather more complex case, to see or listen to Beethoven's *Fidelio* without taking into account its concern with injustice, heroism and freedom (and that not surprisingly it favours the last two and opposes the first) would be so strange that we would normally say that anyone who claimed to be indifferent to its political and moral qualities was simply not responding to the work. If such a person said that they were only moved by the music, and regarded the drama as too crude to take any interest in, we would wonder how they could be moved appropriately by the music without acknowledging that it was articulating the dramatic action. Of course one could listen to the music in a purely abstract way, regarding the voices simply as instruments, but that would not be listening to *Fidelio,* but only to an aspect of it, somewhat as if one were to enjoy the sound of a poem in a language that one did not understand. Of course one need not agree with the morality that one takes a work to be propounding or embodying in order to value it. But once more it does not follow from this that one ignores its morality or regards it as irrelevant, nor does it follow that one thinks less well of the work. One may welcome art which puts a moral position that one can't share in a plausible light. The phenomenology of responses to art is itself a highly complex matter, but it seems to be the case that in imaginatively entering the world of a work one is enabled to test one's reactions to people who hold sets of moral views very different from one's own, and that this is one of the reasons that we value the experience of novels, dramas, etc. Though it is notoriously hard to say precisely what effect a powerful work of art has on us, there is wide agreement that we do sometimes feel changed by such works, which is a cause both for valuing them and also for feeling anxious about them. The latter tends to have dominated Western speculation on the subject, because many philosophers, Plato being the first and most influential, have taken it that art typically works on 'the passions', of which they have harboured deep suspicions, because they are thought of as hard to govern, irrational, selfish and destructive. And the greater the work of art in terms of its power to affect us, the more dangerous it may be.

This raises the issue of internal and external reasons for valuing art. Might it not be the case that the reasons we have for valuing a work as art are, at least sometimes, equally reasons for disapproving of it morally? An analogy with sport might make the point more clearly. Within such a sport as soccer one may behave in a way that is beneficial to the side one is playing on, in that it helps to score a goal; but the whole activity might be frowned on for fostering a spirit of competitiveness, if that is thought to be a bad thing. Victorian schoolmasters were very keen on competitive sports for a range of reasons which might need examining. But it would be possible to disapprove of the whole set of sporting activities that they promoted while being able to make judgments about how well someone was playing a specific game. Similarly, the reasons we give for putting a high value on a work of art might, in the context of our complete set of standards, be reasons for thinking that art itself is deplorable; or that most of what is highly esteemed is deplorable. In practice it turns out to be difficult to maintain this distinction, so that we often find people making what appear to be artistic judgments when they are really making judgments about the whole institution. Conversely, an overenthusiastic application of the distinction leads people to adopt a very narrow set of terms or concepts which they take to be appropriate for judging individual works, and many considerations which might be considered relevant are claimed to be external, that is, to be dealing with a different question - the nature and value of art itself.

4 Art and the self; art and society

Continuing this line of thought, we can deal briefly with two other lines of thought about art and its relation to other enterprises, both of which derive more or less directly from Hegel (§8). It was characteristic of him to take a historical perspective on art, valuing the art of different ages and cultures in terms of its connections with their other concerns. For us, living in a culture decisively formed in all its aspects by Christianity, art takes on a 'romantic' aspect, in his idiosyncratic use of that term. Hegel sees the tension in all kinds of art as the relationship between the medium, which is sensuous, and the content, which is spiritual. Operating along these lines, but without subscribing to Hegel's often bizarre views, Idealist aestheticians have seen artistic activity (which is by no means confined to artists) as the attempt to achieve a perfect congruence between the inner and the outer. Thus the

emphasis shifts to art as self-expression; it is seen as a demanding and ultimately moral activity, since one finds out who one is in the process of its creation.Nietzsche, hostile to Idealism in general, none the less took over this element and in his middle period advocated that we should make our lives into works of art, thus effecting a synthesis of the moral and the aesthetic.

Deviating much further fromHegel, but inconceivable without him, is the tradition of thought loosely called 'Marxist'. Marx himself contributed little on the subject of art, but many theorists working within his general framework have produced general theories of the nature and purpose of art and many specific judgments on works of art, both of which construe it as a crucial contribution to the class struggle. The most crass versions of such a line of thought were perpetrated in the Soviet Union and its satellites, where art was esteemed for bolstering the workers' spirits as they battled against the bourgeois and fascist enemies. The result, in terms of both the kind of art encouraged and endorsed and the fate of artists who failed to conform, is an eloquent testimony to the necessity for a large degree of freedom of expression. 'Socialist realism', which was the approved art of the Soviet bloc, like Fascist art, did not succeed even ephemerally. In the case of Marxism, however, there has been an immense and impressive body of theory in which it is clearly seen that if radical political goals are to be effectively furthered by art, they will not be achieved with slogans and propaganda, but involves the transformation of consciousness - a point that could have been taken from Hegel in the first place. The leading group of theorists has been the Frankfurt School, of which the salient figure was Theodor W. Adorno (§5), a man of immensely rich culture and a modernist in his artistic affiliations. His views on the function of art as critique of society, and the consequent particular value judgments he made on a vast range of works of art, especially music, represent what may be the most impressive single body of work in the field. He expounds the complex relations between the moral and social on the one hand and the artistic on the other with a detailed force that breaks through the obscurity with which they are expressed.

5 Conclusion

As is the case with many profound conceptual issues, it can confidently be predicted that the nature of the relationship between art and morality will never be settled. What does seem to have been established, though, is that the discussion must always take account of historical considerations. The appearance on the scene of new art-forms, such as the realistic novel and large-scale instrumental music, alone makes it unlikely that a theory produced at a given time will ever be adequate for later times. And the more art we have to ponder upon, the more intimate will be the relationship between our theorizing and what we are theorizing about. Hegel may have been exaggerating when he said that writing about art would finally take the place of art itself, but the element of truth in this claim means that the range of moral views available to us and their engagement with the vast body of art guarantees an indefinite future for meditation on the connections between them.

Art and truth

Some things are true within the world of a literary work. It is true, in the world evoked by Madame Bovary, that Emma Roualt married Charles Bovary. In this entry, however, we are not concerned with truth in *fiction but rather with what it is for a work of art to be true of, or true to, the actual world. Representational works represent states of affairs, or objects portrayed in a certain way. The concept of truth naturally gets a grip here, because we can ask whether the represented state of affairs actually exists in the world, or whether a represented object exists and really is the way it is represented to be, or whether a representation of a kind of thing offers a genuinely representative example of that kind. If so, we could call the work true, or true in the given respect.*

A work will often get us to respond to what is portrayed in a way similar to what our response would have been to the real thing - we are moved to fear and pity by objects we know are merely fictions. But a work could also portray *characters responding in certain ways to the imaginary situations it conjures, often with the implication that the response is a likely human emotional or practical response to that situation, or a response to be expected of a character of the given type, and we could reasonably call the work true if we believed the portrayed reaction was a likely one.*

Arguably, if we judge a work to be in some respect true to life, we must already have known that life was like that in order to make the judgment. But, interestingly, works of art appear to be able to portray situations that we have not experienced, in which the portrayal seems to warrant our saying that the work has shown (that is, taught) us a likely or plausible unfolding of the portrayed situation, or shown us what it would have been like to experience the situation. It is also said, especially of narrative fiction, that, because of its power to show us what various alternative imaginary situations would be like, it can enlighten us about how we ought to live.

So we may consider how a work of art might be a vehicle of truths about the actual world. This gives rise to a further question - sometimes called the problem of belief - of whether the value of a work of art as *a piece of art is related to its truth. If a work implies or suggests that something is the case, ought I to value it more highly as art if I accept what it implies as the truth? Alternatively, should I take it as an aesthetic shortcoming if I do not?*

1 Literature as a vehicle of truth: the *Poetics*

Aristotle’s *Poetics* provides a good starting point for considering the claim that art informs us about or illuminates the actual world. Discussing tragedy (which in Aristotle’s terms is a form of poetry) he makes the following claims: (1) that plot is the most important aspect of a tragedy, which is a depiction of actions which form a unity, and (2) that tragedy (along with other forms of poetry) is more philosophical and more important than history, because it makes universal statements rather than statements about particular events.

Here is a suggestion that connects claims (1) and (2). Taking up the point in (1) that plot is a depiction of actions, we can assume that Aristotle means the actions of the characters in the story. A plot, we can now say, is unified to the extent that its depicted actions follow upon one another in a natural or plausible way. What we find plausible depends, of course, on our assumptions about human behaviour. Aristotle suggests that a good plot is able to bring an audience together in its responses to events and hence that some responses are practically universal, resting on truths about human conduct that are ‘necessary or probable’ - a phrase he uses repeatedly in the *Poetics*. This provides a connection with (2). By structuring itself around these ‘universal’ assumptions, a good tragedy can be said to be more like philosophy than history, in that it is biased away from the accidental, towards generality. History simply records events as they happen. It is a matter of indifference to the faithful recorder of history whether historical events are the product of accident or agency, or whether recorded actions are sane or mad, intelligible or whimsical. By contrast, a tragic plot, according to Aristotle, is spoilt if it is interspersed with accidents of nature or with actions that we cannot readily understand through our first-hand familiarity with ourselves and other people. Such a plot is ‘episodic’ in Aristotle’s terms - his word for a narrative sequence whose elements are not, as in a properly unified plot, linked by what is ‘necessary or probable’.

Consider *Madame Bovary* as our ‘tragedy’. Might it be said to depict actions as forming a unity? To begin with, Flaubert’s readers are carried along by the narrative because of the way the depicted actions are motivated and connected by familiar human impulses. His characters behave in ways that are accessible and plausible given their

different temperaments, histories and circumstances. The function of Flaubert's narrative is to draw us into the developing story in a way that depends on our tacit assent to the successive links in the plot, so that we become involved in the fates of its characters as if they were part of our own lives. This suggests the following way in which narratives can be informative. Out of the 'necessities and probabilities' that drive the plot, eliciting our implicit consent along the way, Flaubert develops a complex situation with a dramatic outcome that lies outside our experience and would normally beg an explanation. But his plot and characterization enable us to experience this world from within, so that we get to know what the fictional situation would have felt like if real. At the same time we come to understand how Emma feels, and hence why she does what she does. So we increase the range of our experience and advance our understanding, because a piece of human behaviour that may otherwise have seemed strange or impenetrable has been placed within the range of what is intelligibly human. Where a brief report of Emma's gruesome and tragic demise might have met with incomprehension or prompted a shallow and moralistic banality, the narrative elicits instead a response closer to Flaubert's: 'Madame Bovary, c'est moi!'

2 Literature and moral insight

Since literature seems able to provide an impression of what a possible situation would feel like to us if actual, it suggests itself as a useful tool for exploring the merits of various imagined alternatives to existing lifestyles or kinds of society. Hilary Putnam (1978) has claimed that since the choice between styles of living involves a full human response, including the capacity to feel, it is not an appropriate subject for science, which is essentially propositional in character. (Putnam surmises that we store certain kinds of information in the form of images rather than propositions.) The choice of lifestyles requires practical rather than theoretical reasoning, the former, as much as the latter, being a process subject to rational criticism. The search for better ways of living suggests a significant role for the imagination - and for imaginative literature. Putnam's idea is not that literature should present ideal lifestyles as 'solutions' to the question of how we ought to live, but that it should play a critical role. For example, by showing us what it would be like to live as a certain kind of person in a society organized in a specific way or having various imagined features, it can present us with 'perplexities' which enable us to refine our thinking about the desirability of the way of life represented.

The most substantial explication of the idea that literature can illuminate how we ought to live has come from Martha Nussbaum. Her detailed analyses of literary works - the novels of Henry James in particular - set out to show that literature provides a means of extending our moral awareness beyond the limits to which traditional moral philosophy can take us. 'Schematic philosophers' examples', Nussbaum says, 'almost always lack the particularity, the emotive appeal, the absorbing plottedness, the variety and indeterminacy, of good fiction; they lack, too, good fiction's way of making the reader a participant and a friend' (1990: 46). Only once its many aspects are adequately represented can a complex ethical question become the subject of clear reflection, and then it is easier to see the various and sometimes conflicting values that are at stake. For example, by taking us into the lives of its characters, Henry James' *The Golden Bowl* is able to show us how Maggie Verver's aspirations to a certain kind of moral perfection stand in the way of the full flourishing of her marriage; her love for the prince, fully acknowledged, calls for a more complex moral stance in which she must relinquish the hope of guiltless moral perfection. Thus, she must confront the fact that the full expression of her love may require 'a tragically necessary blindness' (1990: 144) - it may require her sometimes to turn away from or even wound others who are close to her.

3 Other arts

It is natural that representational art, especially literature, should offer the clearest examples of works that are in some way true of the world. But it may not offer the only examples. Turning to nonrepresentational art, Jerrold Levinson has argued (1990) that there are various ways in which music, a mainly nonrepresentational art form, can aptly be described as true. Suppose we accept (as seems reasonable) that anger is a destructive emotion. Passages in the fourth movement of Beethoven's *Pastoral* symphony express anger, Levinson suggests, and the anger is presented as destructive. In this case it seems natural to describe the passages as true. A different kind of example occurs where a transition in a piece of music from one emotional quality to another carries the implicit suggestion that that transition is psychologically plausible in human terms; and we judge the music true if we think it plausible in this way.

Nelson Goodman (§2) holds that all the arts, representational and nonrepresentational, serve a cognitive function

(1972). Thus it is a mistake to associate science alone with the cognitive and to limit the concerns of art to the evocation or expression of feeling. For him, inventiveness in both art and science consists in the development or modification of elements in a symbol system. Successful symbols illuminate the world through the aptness with which they fit their subject-matter, rewarding those who engage with them with enlightening new ways of seeing the world.

Goodman's ideas can fruitfully be read in conjunction with Ernst Gombrich's work on the visual arts (1951). Gombrich starts by attacking the 'myth of the innocent eye'. The recognition of what lies in our field of view when we perceive, he argues, requires the organization of visual input: what we see is structured by what we expect to see. Just as scientific discovery is preceded by the invention of successful hypotheses, the development of our awareness of the visual world requires inspired modifications to the 'schemas' we bring to bear upon it. The history of painting, Gombrich suggests, can be seen as an experimental process by which our actual visual capacities are gradually enhanced by painters' corrective modifications to the existing schemas available for representing the visible world. Rather than simply assuming that our visual awareness reflects the world in an unproblematic way, providing the touchstone by which the accuracy of a picture can be judged, Gombrich's account construes painting as a means by which that awareness is developed.

The view, shared by Goodman and Gombrich, that art is an instrument of perception, is not unproblematic. But it is an important development in twentieth-century aesthetics, and its exposition in the work of these philosophers provides some of the best reading the subject has to offer.

4 The artistic relevance of truth

If a work of art implies the accuracy or correctness of a certain claim, representation, perspective or attitude, can it or should it increase our estimation of the artistic worth of the work if we take the claim or representation to be true or the attitude or perspective to be accurate or correct? A negative answer is implied by I.A. Richards when he writes of our response to literature:

> the question of belief or disbelief, in the intellectual sense, never arises when we are reading well. If unfortunately it does arise… we have for the moment ceased to be reading poetry and have become astronomers, or theologians, or moralists, persons engaged in quite a different type of activity.
>
> (1929: 277)

Support for Richards's claim might come from the idea that art is a distinct category of human activity, with its own purposes and hence its own criteria of merit. On this view, just as we judge the merits of, say, the binding of a book by the standards of bookbinding, so we should judge poetry (remaining with the case of literature) by the special qualities that set poetry apart as an activity: the aptness of verbal choices, the displayed command of metre and rhythm, the elegance and unity of the poem as a whole, and so on. But it is unclear that poetry (or any other art form) comprises a self-contained activity with a fixed purpose that defines it as poetry, and dogmatic to suppose that its 'purpose' necessarily excludes the accurate representation of how things stand in the world. Furthermore, a view like Richards's is hard to reconcile with past and current critical practice. Henry James is widely admired for his moral subtlety, and critics generally assume (and it would seem bizarre to deny) that this quality adds to his stature *as* a serious novelist.

Malcolm Budd (1983) has produced an important argument that bears on this issue. He makes the point that the value of a work of art as art is always intrinsic to the experience it offers. It therefore does not include the beneficial effects the work may have upon our lives. For example, if a novel contains an insight that could illuminate our lives, its insightfulness may accrue to its value as art, but only in so far as the insight informs the reading experience itself, and not in virtue of the work's educative effects. This seems right, for someone could value and enjoy a work as art even though, due to complacency, forgetfulness or some other idiosyncracy, they failed to respond to it in such a way that it benefited or informed their life. But to say this is not to drive a wedge between artistic or aesthetic value, on the one hand, and moral or intellectual value, on the other. These values are not in opposition. It may be its intellectual or moral character that accounts for much of a work's impact as an object of experience; if it displays intellectual or moral shortcomings - philosophical immaturity, for example, or racist attitudes - then that is likely to diminish the value we place on the experience it offers. So, regarding the artistic relevance of truth, we may indeed value a work less as art if we fail to be persuaded about the truth of a

claim it implicitly makes about the world - provided its failure to persuade lessens its value as an object of experience.

Art criticism

To criticize a work of art is to make a judgment of its overall merit or demerit and to support that judgment by reference to features it possesses. This activity is of great antiquity; we find Aristotle, for example, relating the excellence of Sophocles' Oedipus Rex to the excellence of its plot construction. Criticism became a topic in philosophy because reflection on the kinds of things said by critics generated various perplexities and in some cases encouraged a general scepticism about the possibility of criticism. Two general and related problems in particular have taxed philosophers. The first is the question of whether criticism is a rational activity, that is to say, whether critics can give reasons for their judgments that would persuade potential dissenters of the rightness of those judgments. The second, a matter to which Kant andHume made notable contributions, is the problem of the objectivity of critical judgments, it being widely believed that critical appraisals are wholly subjective or just 'a matter of taste'. Arguments that use deductive or inductive reasoning to demonstrate the possibility of proofs of critical judgments are generally agreed to have failed. Another approach redescribes the critic altogether, not as someone who uses argument to prove their judgments to an audience, but as someone who aims to help the audience perceive features of the work of art and understand their role in the work. This entry will concentrate on the issues of the rationality and objectivity of art criticism.

1 A case for subjectivism

Disagreements in art criticism are widespread and frequently intractable. Subjectivists, wishing to demonstrate the impossibility of objective judgment in art, often begin with this apparently indubitable fact - though this tactic suffers from the fact that an observer is as likely to notice the widespread agreement in critical judgments over the pre-eminence of such figures asSophocles,Mozart, Tolstoy, Beethoven, Rembrandt and Shakespeare. Nevertheless, the existence of often intense disagreement cannot be denied, but to concede this is not as yet enough to establish a subjectivist case. For while there are vehement and intractable disagreements in, say, mathematical theory and in physics, these disagreements do not entail the subjectivity of physics or mathematics.

Apart from the fact that disagreements occur in it, there must then be some aspect of criticism that underlies the claim that it is subjective in a way that physics and mathematics are not. It is tempting to think that while mathematics and physics possess proof or decision procedures, agreed on by practitioners of those subjects, in terms of which enquiries in those subjects proceed and disputes in them are in principle resolvable, there are no such agreed procedures in criticism. There, in lieu of argument and proofs, we have only unsupportable opinion. The denial that criticism is a rational activity (one in which reasons can be given for judgments) becomes a principal ground for asserting that critical judgments are subjective.

2 The impossibility of induction and deduction

The above section sketches the claim that there are no proof procedures in art criticism, as there are in physics and mathematics. But what proof is offered for such a claim? One way to argue that proof procedures have no place in criticism would be to take the two most commonly accepted forms of proof - deduction and induction - and show that these cannot be invoked in support of critical judgments.

For induction, one might argue that since all pictures by Rembrandt that have been hitherto examined have been found to be great paintings, any hitherto unexaminedRembrandt is probably a great painting. This use of induction has two weaknesses. First, on what basis was it asserted that the first Rembrandt ever examined was a great painting? Since it was the first Rembrandt, the assertion cannot have been based on inductive proof. Instead, an appreciator probably looked at the picture and simply pronounced that it was a great painting; here the sceptic merely repeats the question of whether that judgment can be proved by reasons. Second, the inductive judgment I have sketched has a peculiar uselessness for the would-be appreciator. Induction might indeed lead the appreciator to conclude that an unexaminedRembrandt was probably a great one. But the appreciator wants not merely to *know indirectly* that the picture is a great one: they wish to see and experience its greatness directly.

Various attempts have been made to introduce inductive procedures into criticism in order to underpin its status as a rational proof procedure. One of the most famous uses the notion of the Golden Section. The claim is that a certain ratio is to be found in all pictures that are the subject of favourable judgments. Hence the presence of that

ratio in a picture constitutes a reason to believe that it is admirable. The claim that any picture exhibiting the Golden Section is admirable is not a self-evident truth, since it seems possible to imagine cases in which a picture that is admirable fails to exhibit the requisite ratio, or cases in which the ratio is exhibited in a picture that is a failure. Hence the claim must be an inductively based and probabilistic one: since admirable pictures have been found to exemplify the Golden Section, and since this picture exemplifies the Golden Section, we conclude that this picture is probably admirable. But, again, one wishes to know how the correlation between being an admirable picture and exemplifying the Golden Section was established in the first place. Presumably, someone asserted that a picture was admirable, then noticed that it exemplified a certain ratio and made a generalization from this. Then, however, the original judgment that the picture is admirable is not justified by induction, but rather underpins subsequent inductive arguments. Again, the sceptic can ask what, if anything, underpins the original judgment that the picture is admirable.

Deduction fares little better in justifying critical judgments. In deductive argument, one offers statements in support of one's judgment, and these statements, if accepted, absolutely force the interlocutor to accept the judgment. It is difficult to see how such a process could work with judgments of art criticism. If I say that a painting is superb and support this statement with the assertion that its composition is admirable, its drawing excellent and its colours radiant, one of two things may happen. First, you may agree that the composition, the drawing and the colour are as I say they are and yet not be forced to concede that the picture is superb. You might, for instance, claim that the composition, drawing and colour, though individually excellent, do not work together. Alternatively, you may deny that the colour, the drawing or the composition are as I say they are. How then am I to convince you that they are? I may go on to claim that what gives the picture its compositional quality is the presence of a patch of colour in a certain position. The problem is that, while you may agree that the patch of colour is in this position, you may not see the contribution that it makes to the composition, and thus not yet be forced to conclude that the location of the patch of colour entails the presence of the compositional quality to which I referred.

3 Generality

The conclusion that neither inductive nor deductive reasoning can be used to prove, and thus justify, critical judgments may be reinforced by another, related set of considerations. A reason has to have a generality. If your doing a certain action in certain circumstances is a reason for praising you, it is reason for praising anyone who does that action in those circumstances. Some thinkers (Stuart Hampshire (1954), for example) have argued that reasoning in criticism is impossible because of the impossibility of this sort of generality in that context. Thus, it is claimed, the fact that a painting has a patch of colour in a certain position may be the explanation for its admirable compositional features. But the existence of that patch in that location cannot be cited as a reason for concluding that the painting is admirably composed. For precisely that shade of colour in the same position in another picture may be the cause of that picture's bad composition. And if exactly the same feature can sometimes count for a conclusion and sometimes against it, it cannot be cited as a reason for believing that conclusion.

Care needs to be exercised here, however. Sibley has remarked that we can make a distinction between what he calls the 'neutral' features of a work of art and the 'merit' features. A neutral feature would be a feature such as the possession of iambic pentameter, an alliteration or a colour patch in a certain position. The feature is neutral with respect to merit conclusions because it is possible without any unnaturalness to say, for example, 'it is the alliteration that spoils this line', and, in the case of another poem, 'it is the (self-same) alliteration that makes this poem.' Statements about neutral features cannot, indeed, be used as reasons in support of critical judgments. However, asSibley observes, other terms do not have the neutrality of those just cited. If we take terms such as 'witty', 'radiantly coloured', 'elegantly composed', 'subtle in its harmonic variations', 'ham-fisted' or 'ponderously executed', then these terms seem to have a positive (or negative) merit force. Though there would be nothing unusual about saying 'What makes it so good is its wit', it would be odd to say, 'What makes it bad is the subtlety of its harmonic variations.' These terms do then seem to have a general positive or negative force and are generally (and so genuinely) reasons for thinking something good or bad. However, as Sibley also pointed out, this positive or negative force is at best *prima facie*. That is to say, although the possession of wit is a *prima facie* reason for saying that something is good, we cannot argue that because something possesses wit, it is for that reason good or has something good about it; for the wit might be out of place, as, for example, it is sometimes said to be in the Porter scene in *Macbeth*. For that reason we cannot deduce a work's value from the fact that it has wit

in it. Once again the critic's judgments seem not demonstrable by reason, a fact that, again, may appear to support subjectivism.

4 An alternative model

Hypnotized by the successes of the physical sciences and mathematics, many who thought about criticism - including, notably, the Russian Formalists - sought to remodel it along the lines of these activities and to look for inductive and deductive ways of proving critical judgments, the impossibility of such proofs being evidence of the unscientific subjectivity of criticism. In view of arguments already given no programme of this sort could succeed. Observable features, such as onomatopoeia, alliteration, patterns of plots, no less than sound patterns in music or colour areas in paintings are neutral features, as likely to count for merit as against it, and cannot support critical judgments in any deductive way.

In fact the model of the sciences and mathematics provides the wrong model for the procedures of critical judgment. What is required in criticism is not inductive and deductive argument but an ability to *see* the qualities of visual works of art, *hear* the qualities of music and *notice* the features of literature. The model that best fits the practices of criticism appears to be the model of getting someone to perceive something rather than arguing someone into something. This is not, as it is with the colours of traffic lights, simply a matter of pointing the gaze of a colour-sighted person in the right direction. Like wine-tasting, aesthetic perception may require practice and experience. The critic, in helping one to see, hear or notice, can use a variety of devices, ranging from simply pointing out the features believed to be present to the use of analogies, metaphors, comparisons and gestures, in the way in which a conductor may help a choir to sing a phrase in a certain way by hand movements.

If this kind of model is adopted - and, given that we use our eyes and ears in artistic appreciation, what more appropriate one suggests itself? - then the questions of rationality and objectivity assume a different aspect. First, the scope of reasoning in artistic judgment is immediately narrowed. What the critic wishes to do is to help the reader, viewer or listener to see or hear what is there to be seen and heard. And although critics can give reasons for looking and listening ('because the object will reward your contemplation'), and although they can give reasons, possibly of a deductive or inductive kind, for believing that something has merit or demerit ('most people think this is good, so try it'), they cannot give reasons that will make people see or hear something. The case is analogous to that of ordinary perception: I can give you reasons to look at the traffic light but not to see that it is red.

Although critical judgments are thus not objective in the sense that reasons can be given to prove them, this is not the only way in which objectivity is possible. We need to ask, then, what kind of objectivity is appropriate to critical judgments. Given that these are perceptual judgments, the kind of objectivity they will have, if any, will be the kind that can be possessed by perceptual judgments. We do have an inclination to believe that statements about the colours of traffic lights and the sounds of fog horns can be true and false, right or wrong. That possibility depends upon there being some kind of agreement in visual response among human beings in the presence of such things as grass and tomatoes. Some, notablySibley, have suggested that this kind of agreement is found in cases of art appreciation, and hence that this activity, too, has some claim to objectivity. That this objectivity is dependent upon human responses does not, as Hume argued (1757), prevent there being standards in terms of which we might adversely judge the adequacies of certain responses: for example, the response of someone who thought Barry Manilow superior toBach.

5 Final remarks

To assert thatBach is superior toBarry Manilow is not to rule out anyone's right to prefer Manilow to Bach. As Kant remarked in one of the most important treatises in aesthetics (1790), if all one wishes to say is that one likes a thing, then, at least in aesthetics, who is to deny one that right? But if one wishes to say that the thing is good, great or awful, one is making a claim that goes beyond any statement of one's personal preferences, a claim that, as I have suggested above, may invoke an appeal to a shared sentiment.

Next, it needs to be noted that discussions of subjectivity and objectivity are bedevilled by assertions that judgments must be either one or the other. Better perhaps to think of the subjective and the objective as poles of a spectrum; to think of the judgments we make, affected as they will almost certainly be by our life histories and our

distinctive human personalities, as lying somewhere along this spectrum; and to be characterized, at most, as tending towards one or other of its poles according to the perhaps excusable degree of idiosyncrasy they display.

Finally, we may sum up art criticism as the activity of detecting and of helping others to detect the perceptual value and devaluing features of works of art. In understanding that activity we need to distinguish two uses of the term ‘reason’: the justificatory sense, when, for instance, we say, ‘A reason for believing that it is good is that most competent critics say that it is so’, which is of doubtful use in art criticism; and the explanatory sense, when we say, ‘The reason it is balanced is the patch of red in the left-hand corner.’ Acute critics are often good at offering such explanations, and this is indeed one of the ways in which we might be helped to see the qualities to which our attention is being directed.

Art works, ontology of

In trying to decide what kinds of thing art works are, the most natural starting point is the hypothesis that they are physical objects. This is plausible only for certain works, such as paintings and sculptures; in such cases we say that the work is a certain marked canvas or piece of stone. Even for these apparently favourable cases, though, there is a metaphysical objection to this proposal: that works and the physical objects identified with them do not possess the same properties and so cannot be identical. There is also an aesthetic objection: that the plausibility of the thesis for painting and sculpture rests on the false view that the authentic object made by the artist possesses aesthetically relevant features which no copy could possibly exemplify. Once it is acknowledged that paintings and sculptures are, in principle, reproducible in the way that novels and musical scores are, the motivation for thinking of the authentic canvas or stone as the work itself collapses.

For literary and musical works, the standard view is that they are structures: structures of word-types in the literary case and of sound-types in the musical case. This structuralist view is opposed by contextualism, which asserts that the identity conditions for works must take into account historical features involving their origin and modes of production. Contextualists claim that works with the same structure might have different historical features and ought, therefore, to count as distinct works.

Nelson Goodman (1981) has proposed that we divide works into autographic and allographic kinds; for autographic works, such as paintings, genuineness is determined partly by history of production: for allographic works, such as novels, it is determined in some other way. Our examination of the hypothesis that certain works are physical objects and our discussion of the structuralist/contextualist controversy will indicate grounds for thinking that Goodman's distinction does not provide an acceptable categorization of works.

A wholly successful ontology of art works would tell us what things are art works and what things are not; failing that, it would give us identity conditions for them, enabling us to say under what conditions this work and that are the same work. Since the complexity of the issues to be discussed quickly ramifies, it will be appropriate after a certain point to consider only the question of identity conditions. For simplicity, this entry concentrates on works of art that exemplify written literature, scored music and the plastic and pictorial arts.

1 Works as physical objects

As in other parts of metaphysics, a theory of what art works are should seek to provide as simple and economical an account as possible, consistent with robust intuition about sameness and difference between works. We shall begin with maximum simplicity, introducing complications as required by consideration of particular cases, some of them real and some of them highly artificial constructs. By the end we shall have arrived at a position of some complexity, but one which has the virtue of treating all works of the kind we shall consider here in a uniform manner.

It seems relatively easy to say what a painting or a sculpture is: a canvas on a gallery wall, a piece of stone shaped in a certain way. In that case, these works are just physical objects. Three objections to this proposal have been made. The first is that art works have properties that a physical object could not have: aesthetic, expressive and representational properties, for example. This objection relies on the assumption that a physical object can have only physical properties. But a physical object might become, say, valued without ceasing to be physical, and being valued is not a physical property.

The second objection is this. If Michaelangelo's statue *David*, D, is identical with a certain block of stone, B, then D and B must have the same properties. But B existed prior to D, which came into existence only when Michaelangelo set to work. So 'existing prior to D' is a property B possesses and D lacks. One response to this objection is to say that physical objects are four-dimensional, extended in time as well as in space, and therefore possessed of temporal parts that are themselves physical objects. In that case we can say that D is identical with a physical object B*, which consists of that temporal part of B that began when *David* was fashioned from the stone and ends when the degraded condition of the stone no longer warrants our saying that *David* exists. But now the distinct-properties argument can be used again to show that D and B* are different. It is true of D that, if Michaelangelo had not lived, it would not have existed; the same is not true of B*. Substantial deformation would

destroy D but not B*.

An alternative and less ambitious proposal would be that art works (of the kinds we are currently considering) are not identical with physical objects; instead they are embodied in or constituted by physical objects. I shall not pursue this line of thought further here. Many of the arguments about identity and constitution apply equally to art works and to other kinds of things (for example, tools), and so belong to general metaphysics, as do the arguments we have considered so far. The only specifically aesthetic argument that has been developed in connection with this is an argument against both the idea that art works are physical objects and the idea that art works are constituted by physical objects. To this argument we now turn.

The claim that certain works are physical objects or are constituted by them depends on an intuitive contrast between singular and multiple works. Among works of the former kind are paintings and sculptures, where the object fashioned by the artist (the ‘authentic’ object) seems to have a unique status - a proper appreciation of the work requires that the viewer sees that object rather than any copy of it, however good. With novels, plays and poems, on the other hand, the original inscription of the work by the author (the autograph) has no special significance for appreciation of the work; any word-for-word copy of the autograph will do. But the significance placed on authenticity in painting and sculpture is due to the fact that aesthetically adequate copies of these works are very hard to achieve. Every visible feature of the work is potentially relevant to the proper appreciation of it, and so an aesthetically adequate copy of the work would have to look exactly like the original. With literature, mere sameness of spelling with the autograph is all that is required of a copy for it to allow us to appreciate the work fully. But this difference between painting and literature is a merely technical one and cannot be the basis for treating these two forms as fundamentally distinct. It is possible (though by no means easy) to produce copies of paintings and sculptures indistinguishable from their originals by the modes of perceptual access appropriate for those works. If this were frequently done, the aura of indispensability that surrounds originals would dissipate. They would be regarded as no more essential to the existence of the work than autographs of novels currently are. (Originals might continue to command high prices on grounds of their personal and historical interest, much as autographs of novels and poems do.) In that case, the claim that in painting and sculpture the work is the authentic object is only as plausible as the comparable claim that the novel is the autograph copy, and this is untenable, as we shall now see.

2 Works as types

Let us consider works of literary and musical art. There are physical objects significantly associated with both genres and these are analogous to authentic objects in painting and sculpture: autograph copies of the text or score. But neither Austen’s autograph nor any other copy of the text can be regarded as identical with the work *Emma*, since no particular copy need survive in order for the work to survive. (Word processing makes the ontological irrelevance of an autograph particularly obvious.) Nor can the work be identified with the class of copies of its text or score. Classes are so defined that a class could not have had members different from those it does have. But there could have been more or fewer or different copies of *Emma* than there are, without the identity of the novel being threatened. With music, drama and other ‘performance’ works, there are performances to consider as well as copies of the score. But a sonata cannot be identified with its original performance by the composer - there may be no such performance - nor with the class of its performances: a symphony might have had different performances from the ones it did, or might never have been performed, without being a different or non-existent work.

For these reasons we may choose to identify literary and musical works with ‘types’, of which copies of their text or score are ‘tokens’. It is common to make a distinction between word- (or letter-) types and tokens, since the same word (or letter) may be inscribed many times; these inscriptions are tokens of the type. The same distinction applies to items of musical notation; we say there are a number of D# semiquavers on the page. Sentence-types are sequences of word-types (which are sequences of letter-types), and texts are sequences of sentence-types. On the view we are now considering, literary works are texts. The closest parallel to this idea for musical works is that they are scores, which are similarly defined as sequences of note-types, the tokens of which are particular inscriptions of notes. Since texts and scores as defined here are abstract structures, we may call an approach of the kind just described a version of structuralism.

One objection to this proposal is that it does not allow us to say that works are created by their authors or composers, since types are abstract objects not capable of being affected by human action; instead, what we

normally think of as the act of composition would, according to the structuralist, be an act of discovery. This objection is not decisive. The structuralist need not deny any of the evident facts about composition: that hard work and talent are required for the composition of significant works; that without that talent and effort these works would not be available to us. We admire those who prove difficult and important mathematical theorems, and our admiration does not dissipate with the thought that these theorems are not created by the people that prove them. Whether the work of the artist is to be described as creation or as discovery can be counted as spoils to the victor in this debate.

Another, more serious objection, but one answerable within a generally structuralist outlook, is that the proposal does not make any provision for the obvious difference between ‘performance’ and ‘non-performance’ works, since it treats plays, symphonies and novels alike as having tokens which are particular inscriptions. We can rectify this by saying that musical works are sequences of sound-types rather than note-types. While note-types have as their tokens particular inscriptions, sound-types have as their tokens particular sounds. A sound-type might be identified by specifying a pitch, a duration and a degree of loudness. (To conform with our ordinary ways of individuating sounds we would need to preserve some vagueness in these specifications.) Thus defined, an instance of the work would consist in the actual production of tokens of the sound-types constitutive of the work; it would be a performance of the work. A comparable stipulation can be made for plays and other non-musical performance works.

There are facts in addition to mere performability which seem equally to demand reflection in our theory of the work. Musical works, at least typically, are intended to be performed *on certain instruments*, and the specification of the work in terms of sound-types alone fails to accommodate this: a sound-type can be produced in ways that would be inappropriate for many works. We could meet the performance-means objection by specifying that the work is a sequence of sound-types-as-performed-on-certain-instruments. But we must go further still. A person who produces the appropriate sequence of sounds on the appropriate instruments by accident, or while improvising, is not, strictly speaking, performing the work. We need to specify further that the work is a sequence of sound-types-as-performed-on-certain-instruments-as-a-result-of-intentionally-following-a-certain-score.

3 Works and their histories

What if our performer, Jones, was following the score of an existing work - the *Hammerklavier* sonata, for instance - but was doing so as a result of having hit upon that score himself by an act of composition undertaken in ignorance of Beethoven’s previous efforts? Would he be performingBeethoven’s *Hammerklavier* sonata? Structuralists say yes, assuming Jones was playing the instrument specified by Beethoven. Some writers have argued that the correct answer is that he is not playing Beethoven’s work, and that consequently the structuralist approach elaborated above is wrong; he is playing a distinct work composed by Jones himself. The argument for this is another version of the distinct properties argument of §1. For the well-informed listener, much of what is interesting and valuable in a musical work derives from the work’s art-historical features. Works are variously describable as stunningly original, fresh, deliberately anachronistic, shamelessly plundered from better composers. We notice and enjoy or deplore their quotation from and commentary on other works. If such features are features of the works themselves, we cannot say that Beethoven’s and Jones’s works are identical just because they are correctly performed on the same instruments in accordance with the same score. Jones’s twentieth-century work may reflect the influence of Brahms, express outrage at the practice of atonality and consciously submit itself to the discipline of an earlier age; Beethoven’s does none of these things. So these works have distinct properties and cannot be the same work. Structuralism’s identity conditions are ahistorical and fail to locate this vital divergence on historical properties, so they falsely identify distinct works.

Three responses to contextualism have been voiced. The first agrees that works do have the kinds of historically determined features just mentioned, but says that their having them is an objection to the structuralist account of work-identity only as long as we think of these historical features as essential features of works. This response is best clarified in terms of possible worlds. The contextualist is interpreted as saying that in the actual worldBeethoven’s work, B, has a certain historically determined feature, F, while in some merely possible world Jones composes an identically scored work, J, which lacks F. But it is agreed that objects have properties in one world that they lack in another; such properties are accidental rather than essential. If we think that historical properties of the kind just described are accidental, we can therefore continue to assert the identity of B and J. This

response misunderstands the contextualist's position. The world the contextualist imagines as a counterexample to structuralism is one in which Beethoven's composition of B is just as it is in the actual world *and* in which Jones also composes J. If it is agreed that in this (merely possible) world, B possesses F and J does not, then certainly B and J are distinct, since an object cannot possess and lack a property in a single world. Contextualism does not depend on any controversial assumption about what properties of works are essential.

The second response claims that historical features such as those described above are not properties of works at all. Instead they are properties of acts of composition. So there is no barrier to identifying B and J, and we may say that there is in this case one work and two acts of composition. The problem for someone who advocates this response is to find a principled way of distinguishing properties of the work from properties of the act of composition. An appeal to common speech or practice will not do, since we commonly speak of works themselves as original or conventional. We might say that, in the musical case, the properties of the work itself are just those that determine how it sounds; the historical properties just mentioned do not do this, since it is agreed that B and J sound the same (in the sense that one could not tell, by attending to sound alone, that something was a performance of B rather than of J). This would have the uncomfortable consequence of driving us back to the original structuralist position, according to which the correctness of a performance of a work depends only on how it sounds and not on the choice of instruments for performing it.

The third response to contextualism says that the historical features described above are features of the work, but insists that they are incompletely specified by expressions like 'is original'. Rather, they are all properties that need to be relativized to contexts of composition, much as velocity needs to be relativized to a frame of reference. On this interpretation, what looks like the paradox of saying 'B is F, while J, identical with B, is not' emerges as the consistent avowal that B is F-in-the-Beethoven-context while J is not-F-in-the-Jones-context. This position faces the same difficulty as the previous one: it must be supported by a principled distinction between relativized and unrelativized properties if it is not to be judged *ad hoc*. If such a distinction can be made, a version of structuralism may be defensible.

4 Autographic and allographic

In the previous section we focused on the question, 'Under what conditions is this work identical with that one?' We now turn to a different but related question: 'What makes an object an instance of this work rather than of that one?' The canvas painted byLeonardo is a genuine instance of *The Madonna of the Rocks*; it is also an authentic instance deriving from the hand of the artist, and those who think painting a singular art say that, for that reason, it is the only instance. The prints pulled from Rembrandt's plate by the artist himself (or authorized by him) are genuine instances of the etching *Tobit Blind*; they are also authentic instances. Are they the only instances? Those who think the artist's canvas is the only instance of a painting will presumably say yes, on the grounds that printmaking is like painting in that only authentic items are instances of the work. In line with this idea, Goodman classifies paintings, sculptures, prints and moulded figures as 'autographic'. Something is an instance of an autographic work only if it has a certain history of production; these arts are all autographic, then, because to be an instance of a work in any of these forms, the thing in question must issue from the hand of the artist, or by their instructions. Autographic arts can be singular, as with painting, or multiple, as with prints.

What, on the other hand, makes something an instance of the novel *Emma*? For Goodman, the criterion is that it should have the same spelling as Austen's autograph; in this and like cases we identify objects as instances of particular works by their structural features and not in terms of their histories of production. A typing monkey could produce something which is, in Goodman's sense, an instance of *Emma*, and a monkey with the luck to strike the right piano keys will produce a performance of the *Hammerklavier* sonata. Novels, poems, plays and musical works are all 'allographic' because of the irrelevance of history to the identification of work-instances. Allographic works are all multiple.

If we accept the argument of §1 according to which authentic instances of paintings, sculptures, prints and moulded figures have no privileged status, we shall deny Goodman's claim that, for works of these kinds, the only instances are the authentic ones. We shall say that indiscernible copies of authentic instances are also instances. Still, we would remain broadly in agreement with Goodman, for the condition of being a copy of an authentic instance is one that appeals to history of production, and so these arts remain autographic. A more radical disagreement with Goodman emerges when we consider the contextualist's argument of §3 which claims that

literary and musical works need to be identified historically. If that argument is right, and two distinct novels or sonatas could have the same structure, then, before we can know whether this performance is a performance of B or of J, we need to know whether the performers' knowledge of the score is traceable through a causal chain back to B's act of scoring or to J's. That way, being an instance of a literary or musical work is partly a matter of history of production, and so all works are to be categorized as autographic. Something which looks exactly like Leonardo's *Madonna of the Rocks* might not be an instance of that work because it is copied from another, independently produced, canvas of identical appearance. And this bundle of pages is a copy of *Emma* rather than of the same-spelled but independently produced *Schemma* because it derives causally from Austen's act of composition and not from that of her lesser-known rival Schmausten. We now have a uniform theory of identity conditions for art works of all the kinds considered here.

Art, abstract

The use of the term 'abstract' as a category of visual art dates from the second decade of the twentieth century, when painters and sculptors had turned away from verisimilitude and launched such modes of abstraction as Cubism, Orphism, Futurism, Rayonism and Suprematism. Two subcategories may be distinguished: first, varieties of figurative representation that strongly schematize, and second, completely nonfigurative or nonobjective modes of design (in the widest sense of that term). Both stand opposed to classic representationalism (realism, naturalism, illusionism, mimeticism) understood as the commitment to a relatively full depiction of the subject matter and construed broadly enough to cover the traditional 'high art' canon through to Post-Impressionism. Analytic and Synthetic Cubism are model cases of the first subcategory while Mondrian's neoplasticism and Pollock's classic drip works are paradigms of the second. Though the effect was revolutionary, the positive motivations for this degree of abstraction in visual art were not wholly new. What was new was the elevation of previously subordinate aims to the front rank and the pursuit of certain principal aims in isolation from the full pictorial package. Thus abstract art variously celebrates structural and colour properties of objects, scenes and patterns; effects of motion, light and atmosphere; aspects of perceptual process, whether normal or expressively loaded; and forms expressing cosmic conceptions, visionary states or utopian ambitions. With a few exceptions (for example, the Futurists) the founders of abstract art were far from lucid or forthcoming about the significance of their work, and viewers have found successive waves of abstraction initially baffling and even offensive. But abstract art now forms a secure part of the 'high art' canon, though generally its appeal is less well understood than that of the classic modes of representation. Criticisms of abstract art have also become more lucid.

The chief philosophical issues affecting abstract art concern the definition of the term and the delineation of subordinate types; the relation between abstraction and other modes of avant-garde art that superficially resemble it; the magnitude of the artistic values so far achieved by the various forms; and finally the theoretical limits of significance attainable by abstraction as compared with the limits encountered in figurative art.

1 The history of the category

The nearest precedent of the category and its label is the use, from about 1870, of the term 'abstract music' for music without lyrics or programme. Until late in the nineteenth century, use of the vocabulary of abstraction in relation to the visual arts was rare and predominantly pejorative. For example, Gustave Courbet in 1861 claimed that abstraction, by which he meant undue emphasis on any partial aspect of art, puts the true end of art beyond reach. Purity was a more common metaphor in early writings about the new art, as it had been in relation to music. The positive implications of 'abstraction' were first exploited in a major way by Willhelm Worringer (1908) and Wassily Kandinsky (1911), though the two had quite different art in mind. They argued persuasively that the 'urge to abstraction' is a 'primal artistic impulse' (Worringer's phrases). The term gained additional currency from the proclamation by Apollinaire and other champions of the new trends in France of a new art of 'pure painting' which drew more on 'conceived reality' than on the data of everyday vision (and not coincidentally evaded rivalry with photography). The category and label remained problematic for decades. Some artists (Braque and Mirò, for example) objected to any of their works being called abstract although the present consensus favours taking many of them that way.

2 Basic distinctions

'Schematizing abstraction' covers here certain forms of depiction which severely curtail the extent to which the visible properties of their subjects are made manifest. The outcome might have been produced by beginning from a natural motif seen from a single point of view and then, for ends quite removed from verisimilitude, reducing its descriptive content as well as adding pattern that is either not descriptive or deviantly so, relative to traditional standards. In contrast, nonfigurative or nonobjective abstraction eliminates all literally descriptive references in order to free expressive or intellectual content from all encumbrance. The work might be produced by beginning from lines, forms, textures, and colours, which are then worked up into aesthetically self-sufficient totalities. Neither category has a sharp boundary, and claims for the superiority of one over the other are doubtful. But the distinction deserves respect since it denotes a significant difference of interest of both the artist and the appropriately responsive viewer.

3 Schematizing abstraction

The schematic rendering of figures, appearances and space of an appropriate sort, carried to the required degree, allows seemingly endless variations, for which no systematic classification has yet been devised. Analytic Cubism, a prime instance, geometricizes contours, evacuates or etherealizes solids, and expunges much other detail. On the constructive side, it repeats edges at different eye-levels, imports contours from quite different points of view, and fractures objects and regions of empty space into overlapping facets or shards, as if an eccentric crystalline structure were being revealed. Since many of the interpolations and displacements are depictively cryptic or altogether nonfunctional, the perceptible nature of the motif tends to be obscured or confused. In classic cases (for example, Picasso's *Portrait of Kahnweiler*, 1911) the central motif (a man dressed in a neat wool suit over a ribbed shirt, embellished by necktie and watch chain, with his hands folded, and a bottle on a table to his right, light coming in from his left, and so on) emerges against the odds from a farrago of translucent angular clutter. Carried to an extreme the process renders the motif unidentifiable. The appeal of this sort of abstraction has been explained in terms of its power to convey the intricacy, instability or illusoriness of perception or of the material world, or alternatively the inner vitality of objects - a power deemed beyond the range of any traditional mode of representation.

Synthetic Cubism revises the schematizing process in two directions. Aspects that are curtailed further include atmosphere and depth. Compositions are dominated by template-like forms, often closely stacked, blocking recession, and with it, atmosphere. Media motifs, printed materials and other inherently flat elements are deployed to similar effect. Suggestions of ambient lighting and perceptual process, typical of Analytic Cubism, are also generally reduced or entirely banished. All this, together with the evident arbitrariness of many of the forms, creates the impression of the composition having been built up (synthesized) from invented components rather than derived by analytic decomposition of a natural motif. Contrarily, descriptive content is in certain respects enhanced compared with the norm in Analytic Cubism. Some forms signify sizeable sections of recognizable objects (a guitar, a table, for instance).

Synthetic Cubist figures may be invested with an uncanny presence, as they are in Picasso's *Three Musicians*, 1921 (The Museum of Modern Art version). Having assumed some of the properties of the flattened planes of which they are composed, yet being represented in full view without any optical interference, the figures have become enigmatic new realities inhabiting an equally unnatural space. This contrasts with the effect in Analytic Cubism of normal objects seen through a radically fractured lens.

Another of the many currents of schematic abstraction is generally known as lyrical or expressionist and is represented by various works of Kandinsky, Franz Marc, Paul Klee and others. Objects and space are dematerialized by blurred and calligraphically naive transforms of the Cubist schemata just cited, and by a dispersal of emphasis over the entire picture plane. Colour is typically dramatic or evocative.

4 Nonfigurative or nonobjective abstraction

Preliminary steps towards nonfigurative abstraction are discernible in forms of schematizing abstraction, notably in the works of Kandinsky, Malevich and Mondrian, but it seems best to define the category independently of this lineage and of the implication of a higher aspiration that may cling to it. (For the same reason 'pure' is best avoided, as is 'impure' for schematizing abstraction.) The key concept is that of a design which conveys no implication of actual (physical or 'tactile') space, though it is optional how strictly one applies this criterion. In no case are figure-ground distinctions excluded, any more than they are in abstract decorative designs. It is enough that depth cues be too faint, too fragmentary, too flagrantly inconsistent, or too dispersed for the image as a whole to convey the sense of any conceivable three-dimensional space. 'Figures' in the weak sense are woven or soaked into the ground, or fused to its surface like letters on a page; or the ground may press so closely upon the figures or switch relations with them so extensively that the continuity, uniformity and ubiquity necessary to accommodate physical contents is implicitly denied. The depth relations suggested by the parts of the design taken in isolation thereby collapse into mere appearances, though they remain vital to the aesthetic effect. This accords with the description by Greenberg and Fried of the pictorial space in nonfigurative abstractions as not tactile, but optical, indeterminate, or virtual - in a sense doubly illusionistic.

Kendall Walton (1990) proposed an alternative explanation of the figurative-nonfigurative distinction. On this

view a nonfigurative Suprematist composition by Malevich represents the coloured patches that are part of the design itself fictionally standing in three-dimensional relations to each other. Were the design figurative, the patches would represent fictive three-dimensional forms, for example, ordinary physical objects, as standing in comparable relations.

Whatever the proper analysis, it seems plain that the appeal of most nonfigurative abstractions depends significantly on the viewer's susceptibility to spatial and more specifically pictorial ways of seeing. Under normal (if not always optimal) viewing conditions Mondrian's grids evoke lattices, windows, partitions or street patterns as if, or almost as if, 'seen' in the sense proper to representations. Similarly Helen Frankenthaler's works often evoke cloud and landscape forms. Even the Arthur Danto 'push-pull' tensions in works by Hans Hofmann and the titanic dimensions of Franz Kline's motifs capitalize on the involuntary exertion of the perceptual energies typically brought to bear on ordinary spatial presentations. The mystery felt to inhere in the more potent nonfigurative abstractions derives largely from the profusion of such subliminal underground connections, which trigger responses even when viewers are discouraged from making a literally representational reading. Possibly even the appeal of Ellsworth Kelly's hard-edged colour-blocks and Agnes Martin's misty stripes devolves in part from the challenge they pose to the space-obsessed visual system.

Closely related to the preceding is the dialectic of image and support stressed by formalist analysts such as Greenberg and Fried. For instance, recognizing that traditional art often seeks to make the support 'disappear' in favour of the illusory image (whereas in the ordinary, nonpictorial experience of a surface the percipient seeks to resolve perceptual flux and obtain a firm grasp of the objective reality) abstract artists have often sought to reverse priorities or play with tensions. Thus drips and slashing brushstrokes are intended to bring the surface to the fore, leaving only fleeting suggestions of images; and colour is poured directly on to unsized, unprimed canvas to bond image to fabric and evade the normal dichotomy of drawn edge and coloured area. Likewise solid 'op art' designs dissolve into fluctuating afterimages or visual squirm in the viewer's perceptual field, even when one attempts to see the surface merely as surface. Formalists regard the exploration of such paradoxes and inversions as a prime aim of nonfigurative abstraction. Others place greater weight upon the externally referential intellectual and expressive content which supposedly becomes available through the unsettling of normal perceptual expectations.

5 Intellectual and expressive values in abstract art

Writers such as Arthur Danto (1981) have demonstrated how much of a worldview may be teased out of seemingly inarticulate art. Thus the brushstroke paintings of De Kooning or their effigies in Lichtenstein are shown to have, in context, a wondrous depth of implication. Arguably the effect results from otherwise inexpressive elements acquiring magnified significance given an initial limitation to minimal means, a long tradition of thought and feeling conveyed by figurative means, and the conviction that authenticity demands zero excess, in the 'less is more' tradition. Where these conditions are met the sparest of patterns can express Zen simplicity, as in the late works of Ad Reinhardt; and Eva Hesse's crumpled cylinders, ragged sheets of plastic and wires wrapped in lumps can balance finely between a buoyant absurdity and pathos. Construed in this way, the game of viewing art can become one of sensitizing oneself to the merest or most idiosyncratic of signifiers.

From its inception the literature of abstraction has made much of abstract works of art conveying, reflecting, exploring, questioning or commenting upon scientific, semantical, aesthetic, or metaphysical concepts and theories. Abstract compositions are said to be creative responses to atomic or other physical theories, mathematical relationships, musical forms, laws of perception and other cognitive processes, unconscious psychological structures, conceptual or categorial truths, or to ideas and issues relating to art itself. Artists are said to engage in research in these domains. Difficulties arise, however, whenever works are presumed to do more than allude in an unspecific way to such referents and projects. To date, the specific content supposedly conveyed or the specific question posed has rarely been divulged. Mondrian, for example, repeatedly declares that art reveals and expresses 'laws of pure plastics' but he never enlightens us as to what these laws are or how we are to derive them from works of art. Nor do propounders of such interpretations ever raise the crucial question of whether a work misconceives or misrepresents its referent. Such reticence obviously casts a shadow over the credibility of these claims. Also, when explicit reference to intellectual content is implied by title, as it is in Georges Vantongerloo's paintings of the 1920s and 1930s (for example, *Composition 15 derived from the equation* $Y = ax + bx + 18$, 1930), doubts arise as to what aesthetic sustenance the viewer can derive from the connection

between design and content. Similarly, Josef Alber's *Homage to the Square* series is tied to his research into colour-interaction phenomena, but the paintings themselves would be ill-served by viewers ascribing artistic merit to them because they exemplify the principles governing such phenomena.

6 The limits of abstract art

The category of abstract art is defined in part by opposition to what is here called classic representationalism. But there is reason to think it should not embrace all nonrepresentational modes. A case in point is art which is 'concrete' in the sense of presenting material objects as such, including, for instance, Marcel Duchamp's unassisted ready-mades. Related examples occur here and there in the multifarious category of conceptual art: Joseph Kosuth's *Titled [Art as Idea as Idea], [water]*, 1966, which consists of an enlarged photocopy of a dictionary definition of 'water'. These works undeniably abstract from representation in that they disavow all fictive appearances, even purely 'optical' ones. But their obtrusive and calculated ordinariness seems to close off all connection to the accepted paradigms of abstract art.

This breach results in significant part from the fact that the ordinariness of the works, taken in context, rebuffs aesthetic contemplation or freely imaginative engagement. Instead of offering a feast for the visual system, the work purports to deliver a message concerning art, the art world or society at large, and one that typically excoriates commodity fetishism, elitism and reverence for art. The mode of signification, on which the work's standing as art depends, resembles that of a rebus or emblem, whose decipherment is most efficaciously accomplished by limiting one's attention to the properties that convey the meaning - convey it, that is, given a detailed context which may include statements or even lectures by the artist. The work cooperates by offering scant aesthetic distraction. Much the same syndrome is found in Robert Morris' quasi-minimalist sculpture. For example, the erect and fallen shafts comprising *Columns* (1961/73) forswear almost all of the modernist sources of sculptural appeal: refined finish, defiance of gravity, balance, precise placement, and so forth.

Perhaps from this analysis a criterion may be devised for distinguishing between minimalist or conceptual works that count as abstract art and those that are best placed elsewhere. Qualifying works would be those inviting fairly comprehensive and sustained aesthetic contemplation. A work that aims mainly at blocking or deflecting such engagement in favour of other ends would fall into one or another adjacent category. Naturally, delicate distinctions are required to apply the criterion. For example, Christo's wrappings may straddle the boundary, since they purport to offer variable but generally quite limited contemplation-worthy fare.

Another boundary question arises over pre-modern works that radically schematize: Cycladic figures, Sepik masks, and countless other 'primitive' images. Accepting such works into the category might seem justified inasmuch as they exemplify the 'urge to abstraction'. On the other hand, the works were certainly not inspired by a conscious rejection of classic representationalism. Further, nothing resembling the play with space fundamental to most twentieth-century abstraction can be plausibly ascribed to them. Thus including them would risk diluting the common ground on which the category was initially based. This issue is rarely discussed in the literature, but obviously deserves attention.

Art, definition of

Many of the earliest definitions of art were probably intended to emphasize salient or important features for an audience already familiar with the concept, rather than to analyse the essence possessed by all art works and only by them. Indeed, it has been argued that art could not be defined any more rigorously, since no immutable essence is observable in its instances. But, on the one hand, this view faces difficulties in explaining the unity of the concept - similarities between them, for example, are insufficient to distinguish works of art from other things. And, on the other, it overlooks the attractive possibility that art is to be defined in terms of a relation between the activities of artists, the products that result and the audiences that receive them.

Two types of definition have come to prominence since the 1970s: the functional and procedural. The former regards something as art only if it serves the function for which we have art, usually said to be that of providing aesthetic experience. The latter regards something as art only if it has been baptized as such through an agent's application of the appropriate procedures. In the version where the agent takes their authority from their location within an informal institution, the 'artworld', proceduralism is known as the institutional theory. These definitional strategies are opposed in practice, if not in theory, because the relevant procedures are sometimes used apart from, or to oppose, the alleged function of art; obviously these theories disagree then about whether the outcome is art.

To take account of art's historically changing character a definition might take a recursive form, holding that something is art if it stands in an appropriate relation to previous art works: it is the location of an item within accepted art-making traditions that makes it a work of art. Theories developed in the 1980s have often taken this form. They variously see the crucial relation between the piece and the corpus of accepted works as, for example, a matter of the manner in which it is intended to be regarded, or of a shared style, or of its being forged by a particular kind of narrative.

1 Definitions

If the purpose of a definition of art is to facilitate the unequivocal identification of items as art works, then it should characterize a property, or some combination of properties, displayed by each and every art work and belonging exclusively to art works, that is, a feature or set of features marking all art works and only them. Such a definition is called 'real' or 'essential' (see Definition); it specifies one or more necessary conditions which in the combination indicated are together sufficient for anything to be of the kind in question.

Definitions can serve goals other than that of unequivocal identification and they need be no more rigorous than is required by the chosen purpose. We might look to a definition simply for the sake of knowledge; for instance, in seeking a precise and systematic catalogue of things. We might aim, alternatively, to teach the meaning of a term and will use such definitional methods as are adequate to achieving that end - ostension, enumeration, dictionary meanings, reference to paradigms. We could wish to prescribe a new meaning or use for a term by an act of stipulation, either for a special purpose (in which case the definition is sometimes called 'operational') or in order to change its meaning altogether (as in revisionist definitions). We might be concerned, instead, to characterize a thing's typical features, or the properties that are significant in our use of that thing; these emphases might result in partial definitions drawing attention to non-essential features. As is apparent from this list, sometimes the task of definition is purely descriptive and at others it is regulative; sometimes it is concerned with the way the world is and at others with linguistic practices; sometimes it is controlled by our interests and at others is largely independent of them.

2 Early definitions of art

Many of the famous theories of art offered in the past - Plato's conception of art as *mimesis* (imitation or representation), Tolstoy's view of art as the communication of feeling,Clive Bell's account of art as significant form - fail very obviously when treated as real definitions. If the key notions are construed so broadly that all art works cannot help falling under them, these notions are also bound to cover many things that are not art works. If the central terms are read narrowly, then, they still seem certain to apply to some things that are not art, as well as not applying to some pieces that generally are agreed to be art. It is best to treat these views as recommending

fruitful approaches to art's interpretation, or indicating art's more salient or valuable features, rather than as real definitions. Indeed, this is the spirit in which most were offered. These theories are addressed to an audience already skilled in the identification of art, and take that common understanding for granted.

Is a more rigorous approach to a definition of art possible? Morris Weitz (1956) has famously and influentially argued that art has no fixed essence and, hence, that no real definition of art can be successful. He notes that when we look, we find no property common to all works of art. Art-making is creative and, hence, inevitably defeats the definer's attempt to congeal what is a fluid process. Weitz explains the unity of the concept of art with the idea of a network of 'family resemblances', a notion he adopts fromWittgenstein's *Philosophical Investigations* (see Wittgenstein, L. §§9-11). Works of art are appropriately grouped together in terms of similarities that link them, though there is no single feature or set of qualities shared by all.

Weitz's positive view faces serious difficulties. Similarity could not provide a basis for recognizing the first works of art, since these had no artistic forebears that they might resemble. Nor does the appeal to similarity explain the status of more recent art works. Some art works, such as ready-mades or representational works, more closely resemble things that are not art than they resemble art works; for instance, art films are more like TV 'soaps' and home videos than sculptures. A counter to this objection might insist that only relevant numbers, kinds, or degrees of similarity are significant in establishing the classification of things as art. To enumerate and clarify the types of resemblance that count towards something's being a work of art is to return to art's definition, however, for one would have to specify the set of similarities that are necessary and sufficient for something to count as art. Weitz's reliance on the notion of resemblance does not replace the need for definitions of the type he declared to be impossible.

On the face of it there is no significant property perceptible in all art works. If so, this counts against the kinds of theories Weitz was keen to attack, namely, those proposing that art might be defined in terms of shared aesthetic properties, these being conceived as qualities revealed directly to the senses. But it is not clear thatWeitz has demonstrated the impossibility of defining art, for the relevant properties might be imperceptible. (One cannot distinguish uncles from other males merely by examining their appearances, but this does not show that the idea of an uncle is indefinable.) It is plausible to expect that some complex, imperceptible relation between creators, the things they make and the audience that receives them will lie behind a definition of art. Hence, even if Weitz is correct in claiming that we do not see a property common to all art works, this does not show art to be indefinable.

What of Weitz's further claim - that a real definition of art will be refuted and repudiated by artists' creativity? Again, the claim appears plausible only when directed against definitions holding that art works must possess aesthetic qualities (given a limited set of these). A definition relating artists, their products and audiences might easily accommodate innovative kinds of art, because it emphasizes the context of creation and reception rather than the constitution of the piece involved in this transaction.

I have suggested that neither Weitz's arguments nor the fact that most adults have a secure grasp of the concept shows the irrelevance or impossibility of defining art. Moreover, there is an obvious need for such a definition, since the claim to art-status of many pieces created in the twentieth century is hotly debated. Some artists have deliberately produced works that challenge the border between art and non-art, provoking the question 'But is it art?' If we could define art we would have a means of resolving disputes about 'hard cases' of this sort. And even if the attempt to formulate a correct definition is likely to remain controversial, we might come to a deeper understanding of art and its context through the pursuit of such a definition. While Weitz's arguments have been influential and the impossibility of defining art is still asserted, the number of publications presenting new definitions indicates that reports of the death of the enterprise have been greatly exaggerated.

It might be said that it is not so much for us to *discover* whether things are works of art as a result of applying to them an independent standard captured in a definition but, rather, to *decide* whether they are art. I regard this response as misguided. As an aspect of culture, the nature of art is socially constructed and historically malleable, depending on human interests and judgments. If the nature of art is relative to, and affected by, human concerns and practices, this will be mentioned in an adequate definition; such a definition could play a role in settling the appropriateness of our deciding a particular hard case in one way or another. Even if it is for us to decide whether something is art, it does not follow that that decision can be entirely arbitrary, for there must be a difference between our coining an additional meaning for an old term and our resolving that some controversial case is to be

properly grouped with undisputed paradigms under the same conceptual umbrella.

3 Functionalism and proceduralism

Many definitions offered in recent decades can be classed as functional or procedural. Functional definitions give centrality to the necessary condition that works of art serve a purpose or purposes distinctive to art, whereas procedural definitions stress that they are created according to certain conventions and social practices. A composite definition mentioning both of these necessary conditions, as well as others, is possible. In practice, though, these two kinds of definition oppose each other, because the procedures by which the status of art is usually conferred have been used to create pieces that fail to serve functions traditionally met by art. Indeed, items may be presented as art, though they have as their point the goal of opposing the attempt to appreciate them in the orthodox fashion. Some functionalists offer their definitions with the goal of excluding such pieces from the realm of art, whereas proceduralists aim to include them. These approaches also differ concerning the connection between something counting as art and its having artistic value. Functionalists see the possession of a degree of aesthetic value, measured in terms of an item's success in fulfilling one or more of the functions of art, as essential to its qualifying as art, while proceduralists regard the artistic evaluation of a thing as separable from the determination of its status as art. The proceduralist's definition is purely descriptive, having little to say about the significance of art or about the reasons that might lead someone so authorized to confer art-status on one thing rather than another. By contrast, the functionalist's definition is normative.

Monroe C. Beardsley (1982), a functionalist, characterizes an art work as either an arrangement of conditions intended to be capable of affording an aesthetic experience valuable for its marked aesthetic character, or (incidentally) an arrangement belonging to a class or type of arrangement that is typically intended to have this capacity. A more recent version of functionalism is given by Robert Stecker (1994), according to which an item is a work of art at time *t* if and only if either (a) it is in one of the central art forms at *t* and is intended to fulfil a standard or correctly recognized function within the set of central art forms at *t* or (b) it is an artefact that achieves excellence in fulfilling a function belonging to the set of functions for central art forms (whether or not it is in a central art form and whether or not it was intended to fulfil such a function).

Among the tasks and difficulties faced by functionalist accounts are as follows. (1) Specifying the functions of art. ForBeardsley, the main purpose is that of providing an aesthetic experience. (2) Acknowledging both that the point of art might alter through time and that the art-historical context of creation affects the aesthetic character of the work and, thereby, its functionality. The historicism introduced by Stecker's time-indexing is designed to cover such considerations. (3) Explaining the dysfunctionality of very poor works of art. Both Beardsley and Stecker do so by allowing that something intended to serve the point or points of art might become an art work even if that intention is unsuccessful. (4) Resolving the status of the hard cases mentioned previously.Beardsley denies that Duchamp's pieces are works of art, whereasStecker argues that, within their art-historical setting, they serve accepted functions of art (reference to and rebellion against former artistic types and practices). He notes that they could not have served equivalent functions in earlier times.

The most detailed version of a procedural account is the institutional theory developed byGeorge Dickie. His most recent definition (1984) runs: (a) an artist is a person who participates with understanding in the making of an art work; (b) a work of art is an artefact of a kind created to be presented to an artworld public; (c) a public is a set of persons the members of which are prepared in some degree to understand an object which is presented to them; (d) the artworld is the totality of all artworld systems; (e) an artworld system is a framework for the presentation of a work of art by an artist to an artworld public. The 'artworld' is the historical and social setting constituted by the changing practices and conventions of art, the heritage of works, the intentions of artists, the writings of critics, and so forth.

Among the difficulties faced by the proceduralist are as follows. (1) Showing that the relevant procedures are established (and, in its institutional version, demonstrating that they mark an informal institution distinguishable from similar institutions with different goals). (2) Accounting for the art-status of works never presented to, or intended for, a public, including the products of isolated artists, of the earliest artists in history and of those working outside the officially recognized boundaries of the artworld, such as embroiderers.Dickie's definition requires not that the piece be presented, but that it be of a kind suitable for presentation; also, he could allow that some pieces are enfranchised as art from within the institution after their creation. (3) Avoiding a vicious

circularity in characterizing the procedures, or the institution in which they are applied, without assuming their products to be art works.Dickie claims that the circularity in his own account is benign. (4) Resolving the status of the hard cases mentioned previously. Dickie sees it as an advantage of his theory that it accommodatesDuchamp's ready-mades, but one might wonder if the procedural account is able to explain what makes such cases hard.

4 Recursive definitions

Weitz's suggestion that something is a work of art in virtue of its resemblance to other (prior) works of art indirectly acknowledges the historicist character of art-making. Artists frequently draw on, refer to or react against their predecessors. Moreover, what constitutes art and what can be done within art depends on what has been art and what has been done within art in the past; the art of the distant past of a culture might differ in many respects from the art of its present, despite the continuity of the process that links one to the other. The historicist character of art has received growing recognition within philosophical aesthetics since the 1950s; more recent attempts at a definition reflect this.

In crude outline, a historicist definition of art has two parts. The first explains how the first works in history came to be art - perhaps by stipulation, or because they served an appropriate function. The second, recursive part states that 'Something is an art work if it stands in an appropriate relation to art that predates it.' The 'appropriate relation' is characterized in various ways. A suitably historicized functionalist definition, for example, would construe the relation as holding between the (intended, central, significant) function of the present candidate and the (intended, central, significant) functions of past works. A suitably historicized proceduralist definition would construe the relation as holding between the procedures applied to the present candidate and the procedures used successfully in conferring art-status on prior works. (I have already noted the historicist aspect given to functionalism by Stecker. The institutional theory is ripe for and would be improved by a similar treatment.)

Some recent historicist definitions conceive the defining relation neither in terms of function nor procedure. Jerrold Levinson (1979) sees the defining relation in the intended treatment of the candidate - a work of art is a thing that has been 'seriously intended for regard-as-a-work-of-art'; that is, regard (meaning treatment, taking, engagement with or approach) in any way pre-existing works of art are or were correctly regarded. James Carney (1991) characterizes the defining relation as a shared style: an object is a work of art if and only if it can be linked by those suitably informed, along one or more various specific dimensions, to a past or present general style or styles exhibited by prior works of art. Noël Carroll (1993) takes the unifying relation to be that of narrative continuity, though he denies offering this as a definition. In his view, something is an art work if it can be linked to preceding art-making practices and contexts by a narrative committed to historical accuracy that reveals the piece as an intelligible outcome of recognizable modes of thinking and making of a sort already commonly adjudged to be artistic. If there is dispute about the artistic nature of the context from which the candidate work arose, then this is to be settled by appeal to a meta-narrative that links that context with acknowledged artworld practices, procedures and processes.

The detail of each of these theories might be examined critically. For instance, one might ask if Levinson can distinguish the art-making intention from other intentions that similarly invite a regard of something as if it were art without aiming, directly or indirectly, at making that thing art; and one might consider whether Carney could analyse the notion of artistic style, or Carroll could develop the relevant notion of continuity in narrative, without begging the definitional question. (Of course, a theorist might avoid such queries by further generalizing the recursive part of the definition - something is a work of art if and only if it stands in the appropriate art-creating relation to previous works. This approach meets these objections, though, only by emptying the definition of content.)

Instead of pursuing such matters here I will mention one concern about the general strategy. It seems that there is more than one tradition of art-making and appreciation; also, what is possible at a given time within one tradition might not be possible at the same time, or at any time, in others. Recursive definitions explain how something is art by relating it in the appropriate way to a given tradition. Such definitions will be at best incomplete, because so much of the explanatory burden is carried by the implicit, undefined notion of an artistic tradition. If something is a work of art within only one of many possible traditions, then the notion of art is not fully explicated until a basis is provided for distinguishing traditions of art from other historically continuous, cultural processes or practices and, also, for individuating one artistic tradition from another.

Two ways of attempting to dismiss this point fail, I think. First, it would be both false and offensive to confine art to a single cultural tradition, such as that arising from western Europe, and to dismiss other traditions merely as generating non-art that serves functions similar to those of art. And even if we allow for the many human artistic traditions, it might be implausible to reject the possibility of non-human, non-terrestrial art. Second, it would be an error to suggest that the proposed definition allows that something is a work of art if it relates appropriately to any pieces in *any* tradition of art-making, for the work then becomes decontextualized. This is unconvincing because it implies that, if something could become art within one tradition, it could become art in any; if Duchamp could make a work of art of a urinal in USA, a Chinese artist might have done the same in China. Rather than emphasizing that the art status of a piece depends on the piece's historico-cultural location, this approach treats the place of the piece in its given tradition as irrelevant to its status as art.

Art, performing

Some works, such as plays and pieces of classical music, are created as instructions (either notated or implicit in an exemplar) for performers; performances of such pieces arise from the appropriate execution of those instructions. Because the instructions do not specify all features possessed by an accurate performance, performers inevitably contribute something to the performance; even ideally accurate performances differ in the interpretations they offer. Some such works serve primarily to highlight the performer's talents. Even where this is not so, some awareness of what is involved in rendering a piece is necessary to appreciate a work written for performance, since the skills and techniques of performance are the artistic media through which the work's contents are presented. Performances are evaluated for the life, integrity and interest of their interpretations, as well as for their accuracy. The desirability of one performance over another relates partly to the knowledge and experience of the intended audience.

Other works, such as films, involve performance in their creation rather than in their transmission. If these works are multiple, they are so because copies are cloned from a master. When completed, such pieces are not performed or interpreted; they are shown or displayed.

Free improvisation might stand as performance in its own right, being neither the creation of a work nor an instance of one. The criteria in terms of which improvisations are evaluated differ from those involved in the creation or transmission of works, taking into account the fact that the improviser's efforts involve the risks, as well as the delights, of spontaneity.

1 Arts involving performance

The performing arts include theatre, dance and other forms of movement, opera, film and television, as well as instrumental and vocal music. Some performing arts are now lost - sagas, narrative poetry and storytelling, for instance; others are marginal as performing arts - poetry, for example. Some activities that include performance are not counted among the arts, such as circus, striptease and televised advertisements.

2 Works for performance

In the case of works created for performance, artists (such as playwrights, composers, choreographers and authors) produce either instructions (in oral form, or in the form of a script or score) that performers execute or a model instance that they emulate in delivering instances of the works. A work for performance is complete when its score, script or model is complete. Such pieces are instantiated in their various performances. The works are distinct from their performances; they have been variously characterized as universals, types, kinds or classes (see Art works, ontology of §2). Pieces represented by a score or script might never be performed; that is, they might have no instances. Theorists sometimes distinguish performance for an audience from rehearsal, practising or private enactments. What should be acknowledged is that the activity takes its point from generating and publicly transmitting instances of given works.

In the case of works for performance, artists' instructions should be interpreted in light of the relevant performance practices; what can be presupposed might not be mentioned or notated, despite its being required, and not all that is mentioned or notated will be mandatory. To perform a work, performers typically produce an instance of the work by following the artist's instructions or model, or by copying other performances derived from those. (If a gust of wind by chance produces a sound acoustically indistinguishable from some performance of a Beethoven symphony, that sound-event would neither be a performance nor would it otherwise instantiate Beethoven's work.) A performance of a given work that contains some departures from the artist's instructions might still be regarded as a performance of that work, provided the work remains recognizable in the performance. To the extent that it diverges (whether this is intended by the performer or not) from the artist's determinative instructions, a performance is inaccurate or unauthentic as an account of the artist's work.

The relevant conventions and artists' notations underspecify or do not determine many of the features displayed in a performance of the work, and where performers emulate a model instance, the realization of many details is by convention left at their discretion. Where performers are left free, they are constrained only by the wider conventions of style or genre. The level of the performer's creative autonomy varies within and between the

performing arts; jazz dancers have more liberty in their actions than do ballerinas. But, even in those performing arts that provide highly detailed instructions, many crucial choices are left to performers; for instance, many aspects of speech delivery and gesture are not indicated by the playwright. It is by their treatment of those matters on which performers are free that equally faithful (but different) interpretations are distinguished. A single interpretation or production might receive more than one performance.

Though the work is distinct from the score, script or model instance produced by the artist, I hold that the identity of the work derives from the instructions notated or implicit in the model. These, in turn, are identified in relation to the artist and the period of creation. In that case, one cannot perform the work except by performing it as its creator's, and doing this requires faithfulness in the relevant respects (as determined by artistic conventions of the genre at the time) to the instructions produced by the artist. A performance can instantiate a given work only if it is faithful or authentic to the appropriate degree. I claim that we are interested in performances primarily as performances of artists' works and that this is how they are advertised and represented. (This is not to say, though, that we shun works from unknown provenances; a speculative account of a work consistent with the conventions of its time usually provides something worth considering, if not definitively its artist's work.)

The history of its performances and the constitution of the intended audience also are relevant in assessing the degree of faithfulness appropriate for a performance, as Jerrold Levinson has argued 1987). The first performance of a work should aim at a high degree of faithfulness, as should a performance directed at novices. Where works are well known, as are Shakespeare's plays in the West, much of the performer's duty of faithfulness has been discharged already; other desiderata, such as contemporary relevance, novelty and verve, become more prominent. Performances are evaluated in terms of the life, coherence, variety and interest they bring to the work, and these features are relative to the audience's prior experience of that work or similar ones, as well as to the materials furnished by the work's creator.

Stan Godlovitch (1993) specifies the following conditions for the integrity of live performances: only one work is performed at a time; its proper sequence is respected, as is the indicated rate of delivery; the performance is continuous, without unjustified breaks; performers comply with the appropriate roles (and do not, for example, swap parts midway through the work). Also, the audience should be in a position to receive the entire performance in every detail. Note that such conditions are required by the view presented earlier: the primary aim of performance is to deliver the artist's work, as specified, to an audience.

3 The centrality of the performer

That artists need the services of performers in instancing their work is not to say merely that performers are means for the work's transmission. The foundry workers who follow the sculptor's instructions and the film's projectionist help to create or transmit the work, but theirs is not the pivotal role of the performer. They might be replaced by technologically superior alternatives without thereby altering the artistic character of the statue or film, whereas the performer's task is ineliminably part of works created for performance.

Artists work with media; the appreciation of art requires the audience to be aware of the limits and possibilities of the media employed. In the performing arts, the requirements of performance are part of the medium in which artists operate. Artists do not create works that happen to be performed; rather, they write *for* performance, taking into account what will be involved for performers when they produce the outcome. (So it is that a new, though derivative, piece results when a musical work is transcribed for instruments different from those specified for the original.) Just as the viewers of a painting consider not only what it represents, but also its surface and the manner of its representation, so audiences in the performing arts consider the artist's use of the performers and their props or tools. They should be aware, for instance, that a dance depicts the death of a swan, that a given actor is playing the parts of several characters and that organists use their feet as well as their hands.

Many works for performance employ the performer's skills in order to achieve narrative, expressive, formal or other effects. These, rather than the performer's activity, are the proper focus of appreciative concern, even if that concern involves an awareness of the connection between the artist's instructions, the performer's efforts and the artistic result. In other pieces, though, the artistic point of the work is to highlight the expertise and techniques of the performer. This is the case with works providing virtuosic roles for one or two performers; some genres, such as the concerto and étude, are of this kind. As Thomas Carson Mark suggests (1980), such pieces are about the

talents required to perform them; the audience's fullest appreciation requires a recognition of the difficulties overcome by the performer in making the rendition seem effortless.

Combining the points just made with the earlier emphasis on the relation between the work's identity and its means of performance, it is possible to see why the tools, techniques and skills of the performer come to be valued and preserved in their own right, sometimes despite the availability of simpler alternatives. If a new ballet shoe were capable of doubling the height of a dancer's leap, it would not be appropriate for dancers to wear the new shoes for performances of nineteenth-century ballets; even if exaggerated elevation is a desirable feature in such works, the difficulty of achieving that elevation is also part of those works. Similarly, the programmed synthesizer is no substitute for the violin when it comes to performingBach's *Partitas*, even if it exactly reproduces the sound of a violin. It is not surprising, then, that musicians, dancers and actors of the past formed guilds, not only to train novices but also to keep secret the tricks of their crafts. Contemporary performers are expected to maintain the required standards.

The central place of artistic skill and creativity in performances helps to explain the distinction between, on the one hand, the disc jockey or ink-printer and, on the other, the performer. The former might be involved in delivering a work of art to an audience, but their roles lack the particular skills for which artists plan the shapes of their works. Tragedies are written for actors and concertos are written for pianists, but films are not made for projectionists and bronzes are not made for casters. Thus it is sometimes said that performers are artists' collaborators, not their servants.

4 Works made through performance

By contrast with pieces created for performance, some kinds of art involve performance not in instantiating the work but, rather, as an essential element in its creation. This is typically the case in cinema. Unlike a play, a movie is not completed as a work when it is scripted; movies must be made, and performers contribute to this process. Once finished, the cinematic work is screened, not performed. The cinematic art work is the master print, which is multiply instantiated by prints cloned from it. The same is also true for some kinds of music, such as electronic pieces that use tapes of the voice or instruments as their source material; the work is the finished master tape and the copies made from it.

An interesting puzzle is raised by popular music, in which discs derived from the master have a dominant status and 'performances' frequently involve 'lip- and hand-synching' to recordings. (Multi-tracking might preclude genuine live performance.) Is the importance of these recordings a sign that they are definitive of the work? If so, artists' rerecordings of their own compositions result in new works, not merely in new performances. Alternatively, is it that the recording is a model instance that may be performed live? In that case, the recording is the more important, not because it is that work's only instance, but because it sets the standard for the work's subsequent performances. (Or are these questions redundant, because the piece has become the music video, which has superseded the audio tape?)

5 Performance in the absence of works

So far I have concentrated on the connection between performances and art works, but performances might take place in the absence of works, as is sometimes the case with street theatre. Dancers might dance without making an instance of any work, or thespians might act without performing a play or making a film. Where there is no work to be followed, the content of the performance is improvised. While there is much to appreciate that is common to both improvised performances and performances of works, there also are differences to be recognized, as Philip Alperson has noted (1984). Obviously one cannot criticize free improvisers for lack of faithfulness to artists' specifications, since they follow none. (There can be mistakes in improvisation, however, when, for example, conventions of the adopted style are violated.) Spontaneity and inventiveness are valued in improvisation; meanwhile, some looseness of structure and lack of polish are less blameworthy in an improvised performance than in one in which such factors are produced by the artist or result after hours of rehearsal. And where there is common ground for appreciation the basis for evaluations can differ. Both improvisations and works for performance might be enjoyed for their narrative or formal structures, inner harmony or overall beauty, but it is relevant that, in the case of the former, responsibility for the achievement lies solely with the performers, who act freely and do so at the moment of performance.

Why not say that improvisation results in a work created by someone who acts both as performer and artist, even if the piece that is the outcome is not itself *for* performance? The difference between improvisation and the creation of a work through performance does not depend on the number of instances, because an improvisation might be taped and, thereby, duplicated, just as a film might have many prints. The results of improvisation are not more ephemeral in principle than are works created with the help of performers. The basis for the distinction, I suggest, is a matter of convention - we talk of films as works, yet we do not describe sessions of free improvisation by this term. This way of talking implicitly acknowledges differences in the goals of improvising and of creating permanent works through performance.

Why not allow that improvisation results in a model of a work for performance? The answer is as before: improvisation is not conventionally approached as providing a work recipe for others to realize through emulation. An artist might recall and notate a piece that was originally improvised, asJ.S. Bach is thought to have done with his *Musical Offering*, but this shows not that all acts of improvisation simultaneously involve the creation of works for performance but only that a work for performance might be composed through improvisation. It matters that the artist supplies a notation or specifies that the original improvisation be taken as a model performance, for without such indications there is no warrant for regarding the result as the creation or performance of a work.

Art, understanding of

Art engages the understanding in many ways. Thus, confronted with an allegorical painting such asVan Eyk's The Marriage of Arnolfini*, one might want to understand the significance of the objects it depicts. Similarly, confronted with an obscure poem, such asEliot's The Waste Land, one might seek to understand what it means. Sometimes, too, we claim not to understand a work of art, a piece of music, say, when we are unable to derive enjoyment from it because we cannot see how it is organized or hangs together. Sometimes what challenges the understanding goes deeper, as when we ask why some things, including such notorious productions of the avant garde as the urinal exhibited by Marcel Duchamp, are called art at all. Some have also claimed that to understand a work of art we must understand its context. Sometimes the context referred to is that of the particular problems and aims of the individual artist in a certain tradition, as when the church of St Martin-in-the-Fields is understood as a contribution by its architect to the vexing problem of combining a tower with a classical façade. Sometimes the context is social, as when some Marxists argue that works of art can best be understood as reflections of the more or less inadequate economic organizations of the societies that gave rise to them. The understanding of art becomes a philosophical problem because, first, it is sometimes thought that one of the central tasks of interpretation is to understand the meaning of a work. However, recent writers, notably Derrida (1972), query the notion of the meaning of a work as something to be definitively deciphered, and offer the alternative view of interpretation as an unending play with the infinitely varied meanings of the text. Second, a controversial issue has been the extent to which the judgment of works of art can be divorced from an understanding of the circumstances, both individual and cultural, of their making. ThusClive Bell argued that to appreciate a work of art we need nothing more than a knowledge of its colours, shapes and spatial arrangements. Others, ranging from Wittgenstein to Marxists, have for a variety of different reasons argued that a work of art cannot be properly understood and appreciated without some understanding of its relation to the context of its creation, a view famously characterized byBeardsley and Wimsatt (1954) as the 'genetic fallacy'.*

1 Minimal understanding

Some, notably Clive Bell (1914), have argued that in order to appreciate a work of art we need a very minimal understanding of it. We do not need to understand what, say, an allegorical picture represents, or when, how and why it was painted. All we need is knowledge of its form as revealed in its colours, shapes and spatial arrangements. Apart from the unfortunate way in which this encourages appreciators to treat representations of suffering, grief and loss as exercises in aesthetic pleasure-seeking, and apart from the cavalier dismissal of the delight that we take in representation and expression, this theory fails even as an account of the appreciation of form. Sometimes it is only when we understand what is depicted that we can appreciate the formal composition of a work. In Stubbs's painting *The Duke of Richmond's Racehorses at Exercise*, it is only because we recognize a pointing hand leading our eyes in a certain direction that we understand the composition of the painting.

Wollheim (1980) has argued that the very possibility of representational painting entails a reference to the pictorial intentions of artists. Hence, granted that representation is a relevant concern to the appreciator of art, understanding is, on Wollheim's view, related to intention. For seeing a canvas as a representational painting differs from seeing, by an exercise of one's fancy, pictures in a moss-covered wall; the difference, Wollheim claims, being a matter of there being a standard of correctness for representation. We correctly understand a representation when there is a match between what we impute to the canvas and what the artist intended to represent. Both to understand that something is a representation and to understand what it represents we need a reference to intentional activity.

2 Categories

Some, including Kendall Walton (1970), have argued that evaluation and understanding are related, since in order to make a proper evaluation of a work of art it is sometimes necessary to understand to which category of art it belongs, a view also argued by Richard Wollheim, and vehemently denied byCroce in his attack on the notion of artistic genres. This view has some affinity with a discussion in moral philosophy initiated by Peter Geach in his distinction between predicative and attributive terms (1956). Consider the difference between 'grey' (predicative) and 'big' (attributive). 'This is a grey mouse' divides with no oddity into 'This is grey' and 'This is a mouse'. This

being so, we could know that a thing is grey without knowing to what category it belongs. But ‘This is a big mouse’ does not appear so easily to divide into ‘This is big’ and ‘This is a mouse’. The truth of assertions about bigness (unlike those for greyness) seems to be related to different standards of normal size for different categories of things. Similarly some have argued that judgments of merit in aesthetics are relative to categories. What is beautiful as the neck of a horse might not be beautiful as the neck of a Vice Chancellor, and the excellences of sonnets are not those of haiku. A clear case of a need to know the category of a work is the case in which we need to know that a work is ironic or a parody in order to appreciate it properly.

It is not, however, entirely clear that critical as opposed to classificatory judgments of works of art do require understanding of categories. It is legitimate to ask whether what is a good sonnet in the sense in which it meets the requirements of membership of that category is also a good literary work of art - a question that seems to invoke non-specific categories of appraisal in use across the arts.

3 Evaluation and explanation

Many have argued that it is one thing to evaluate a work of art and another to seek an understanding or explanation of its genesis. Beardsley and Wimsatt (1954), for example, claimed that understanding a poem as a prelude to critically appraising it requires only such knowledge of the public language as could be obtained from dictionaries or from any competent speaker. It does not require knowledge of the intentions of the poet to mean something, for the words of the poem belong not to the poet but to the language. This does not rule out historical studies. In the case of a work of some antiquity, as the critical apparatus of most Shakespeare plays will demonstrate, in order to secure understanding we might have to do considerable research to find out what the public meanings of the words were at the time of publication. According to Beardsley andWimsatt, this does not license biographical enquiries, however, since what we are interested in are the public words of a public text, not the private meanings of an author.

To investigate the genesis of the work would indeed be to understand more about it and how it came to be as it is, but this, Beardsley andWimsatt claim, would not be relevant or necessary to its assessment. A similar line was taken by Trotsky, who argued that a work of art is to be judged by its own laws (1924). That done, a Marxist could explain, as Marxists can for any human product, valuable or not, how that artistic product had ultimately arisen from a certain economic sub-structure of a society (see Marx, K.). The understanding of the work that this would yield would not, however, be relevant to judgments of artistic merit. In the next two sections we shall look more closely at such attempts to separate understanding and evaluation.

4 Understanding, truth and morality

Much of the debate about art and understanding is a debate about how much of what might rightly be called an understanding of art is relevant to questions of the evaluation of art. Bell, for example, would not have denied that it is a fact aboutFrith’s Victorian narrative painting *Paddington Station* that it is a representational painting. To understand that is to understand something about the painting. What Bell would have denied was that this understanding had anything to do with the appreciation or value of the work. Bell’s denial of the relevance of an understanding of the representational aspects of a painting, however, seems merely by fiat to eliminate aspects of paintings which people unhesitatingly enjoy and which, asWollheim and others have argued, are highly relevant to aesthetic effects.

We may take as a more promising example of the debates about the relevance of certain sorts of understanding the vigorously controversial issue of the relevance to evaluation of an understanding of the truth and morality of a work of art. Some, including Wilde, have denied that works of art can be true or moral at all. But among those who concede that a work of art might contain truths (as Kafka is said sometimes to have captured a truth about the human condition) and might articulate a moral stance (as Jane Austen is often said to do) there are those who deny that an understanding that a work truly has these aspects has any bearing on its evaluation. As to morality, there is a perfectly good sense in which anyone who missed the fact that a certain moral outlook pervades a novel by Jane Austen has not understood that novel. The question is whether that understanding is involved in the assessment of the work, a question to which F.R. Leavis categorically gave an affirmative answer and to which Croce gave an equally categorical negative reply (see Art and morality §3).

When we come to relevance of an understanding that a work of art articulates a view of life, including a view that can be characterized as morally correct, matters are initially muddier because of the complexities involved in assessing views of life. (How is pessimism to be weighed against optimism?Fielding against Kafka?Jane Austen againstSartre?)

One very important approach, adopted by certain Marxists, relates understanding the point of view of a work intrinsically to its evaluation. Suppose we allow that a work of art can articulate a view of life, and that to understand that work is, in part at least, to understand the view of life that it articulates. But, on one reading, Marxist theory claims to possess a privileged understanding of the objective laws of historical progress. In terms of those laws it is possible for a Marxist to say that such and such a state of society is a defective stage of human organization, to be surpassed in the forward march of history, and, further, to say that anyone endorsing that state of society shows a defective understanding of history. Then the way is open for a Marxist to say that a worldview articulated in a work of art can display a defective understanding of social relations (as some alleged was the case with Dickens's *Hard Times*). It would seem narrowly prescriptive to say, without further argument, that this judgment is irrelevant to an assessment of a work of art. For it attributes to a work a lack of understanding, perceptiveness, and possibly imagination. It certainly treats it as the expression of an inadequate state of social consciousness. But then, it seems that there is at least one account that links understanding a work of art with its evaluative judgment. For to understand the work of art is to understand it as the articulation of a worldview, and to understand that aspect is to open the possibility of assessing the work in terms of the adequacy of the worldview it articulates as well as the adequacy of its articulation of it.

Whether such an account can ever be made to work depends on the truth of the Marxist claim - vigorously contested - that they have a privileged access to the objective laws of history. Even if such a claim were false, it should not be forgotten that part of our understanding of a work may involve an understanding of the view of life articulated in it, and, further, that our reaction to a work is often very much bound up with our feelings, not merely about the quality of the way in which that view is expressed, but also about the view itself (see Art and truth §4). Hence Wittgenstein's frequent comment that he could not understand and engage with some works of art, for example the music ofMahler, as opposed to the works of Brahms, because he could not see the world from that viewpoint (1966).

5 Criticism as retrieval

Many have spoken as if the central task of all our dealings with art is evaluation, and other activities, such as the understanding of the whole context of a work, are irrelevant to criticism and appreciation. The element of truth in this is that we tend to embark upon enquiries into genesis and context after we have made the decision that the work is worth it. We study the origins of *The Waste Land* because, prior to any such study, we found *The Waste Land* rewarding. However, we cannot conclude from the fact that we are prompted to learn more about the circumstances of a work after it has impressed us favourably that information discovered about it subsequently is irrelevant to our assessment. Things that emerge on further enquiry might produce radical alterations in assessments (as when we discover that we were taken in by the excellence of a parody).

Second, on reading a work, we may find things in it that puzzle us. Beardsley and others are right that it is a fact about some works that they are puzzling. It is possible, however, not merely to settle for the knowledge *that* a work is puzzling. That leaves a gap in our understanding which we can plug by seeking reasons for why the work is as it is. The positioning of the figures in Picasso's *Les Demoiselles d'Avignon* will not change when we examine its very many drafts and sketches. But puzzlement as to why they are as they are will be replaced by a better understanding.

Finally, it is too easy to talk as if evaluation in some narrow sense were all there is to the appreciation of art. There is also such a thing as a love of a work of art, which, as is often the case with love, wishes to know all there is to know about the object of love and ultimately to understand it as fully as possible. To the lover of the work nothing about it is ultimately irrelevant. And this is related to the view that Richard Wollheim has defended of criticism as 'retrieval', where that involves:

> the reconstruction of the creative process, where the creative process must in turn be thought of as something not stopping short of, but terminating on, the work of art itself. The creative process reconstructed, or retrieval

complete, the work is then open to understanding.

(1980: 204)

Understanding and appreciation cannot be divorced, if for no other reason than that to understand a work of art may just be to hear, read or look at it with a certain kind of appreciative enjoyment. AsWittgenstein remarks, understanding that a Brahms rhythm has a certain queer quality is inseparable from experiencing that quality in it (1966: 20).

Art, value of

Art has as many kinds of value as there are points of view from which it can be evaluated. Moreover, the benefits of art vary with the role of the participant, for there are benefits that are specific to the creation, the performance and the mere appreciation of art. But in the philosophy of art one value is basic, namely the distinctive value of a work of art, its value as *a work of art, which can be called its 'artistic value'. This value is intrinsic to a work in that it is determined by the intrinsic, rather than the instrumental, value of an informed experience of it, an experience of it in which it is understood. Artistic value is a matter of degree, but it is not a measurable quantity, and whether one work is better than another may be an indeterminate issue. A judgment about a work's artistic value claims validity, rightly or wrongly, not merely for the person who makes the judgment but for everyone. Both David Hume and Immanuel Kant tried to show how such a claim could be well-founded, but their attempts are usually considered failures, and there is no accepted solution to the problem they addressed. Many philosophers have been concerned with the relation between artistic value and other values. The most famous attack on art, founded on its supposed relation to other values, was made by Plato, who claimed that nearly all art has undesirable social consequences and so should be excluded from a decent society. Plato overlooked many possibilities, however, and the question of art's beneficial or harmful influence is a much more complex issue than he recognized.*

1 A multitude of values

There is no such thing as *the* value of art. For works of art can be evaluated from many different points of view and, corresponding to these points of view, they have many different kinds of value: moral, political, social, historical, religious, sentimental or therapeutic, for example. Moreover, for a particular kind of value, whether a work possesses that value, and the degree to which it does so, will often be a relative matter, depending on the kinds of people whose involvement with the work is in question. Furthermore, for any given person this value will be relative to the role they occupy in the creation, performance and appreciation of the work - the contribution of any one of these roles to the value in question being unlikely to coincide with the contribution of any of the others.

2 Artistic value

But although art has many kinds of value, within the theory of art one particular value is fundamental, namely the value that is distinctive of art, a work of art's distinctive value, the value of a work of art *as* a work of art, or, as I shall call it, its artistic value. Just as moral value is the kind of value that moral judgment is concerned with, so artistic value is the concern of artistic judgment. This value is fundamental in an account of the value of art; for whatever other kind of value a work of art may possess, the important question is how this other kind of value is related to its artistic value.

Perhaps it will be thought that there is no such thing as a work's artistic value, or that the identification of such a value must be the expression of a moral or political ideology, rather than the acknowledgement of what should be recognized from any position as the distinctive value of art. I believe that this view is mistaken. Although the identification of a certain value as the distinctive value of art must, given what has happened to the concept of art in this century, be to a certain extent stipulative, the identification should not and does not need to be the product of an ideology. It is a mistake to think that the identification of artistic value must have built into it a commitment to some other kind of value, of which the identification is a mere reflection, or a claim to the supremacy of artistic value over other values. Rather, artistic value can and should be identified in such a way that its own worth, as measured by some other standard, is left entirely open, as a matter for further investigation.

What is needed is the specification of a value that all great works of art possess to a high degree and that an artist, in their role as artist, attempts to endow their work with. Such a value exists and can be specified without prejudging any questions about how important it is or what its relations to other kinds of value may be. Clearly, a work's artistic value is simply how good a work of art it is. Accordingly, artistic value is a matter of degree: works are not just better or worse than other works, but they can be much better or worse, or perhaps only slightly better or worse. The question, therefore, is what kind of value is credited to a work of art when it is valued as a work of art, and what value is withheld if the work is thought not to be a good work of art?

A plausible way of conceiving of artistic value emerges from two considerations, the first concerning the importance of understanding a work for the viability of a verdict on its artistic value that rests on that understanding, the second concerning the way in which works of art matter to us when we value them as art.

The first consideration is that whether there is just one correct and complete understanding of a work or many, a verdict on a work's artistic value is insecure unless it is based on a correct understanding of the work. In other words, the fact that you do not properly understand a work undermines the authority of your evaluation. The second consideration is that when we value a work of art as a work of art we value it on account of what it provides us with *in* the experience of it, rather than for something it achieves *by means of* our interaction with it. Artistic value thereby contrasts with medicinal value, for example. The medicinal value of a drug is determined not by the nature of the experience of taking it but by the beneficial or harmful effects that it has on our health. But a work's artistic value is dependent on nothing other than the nature of the experience involved in the appreciation of it.

Putting these two thoughts together, the natural way to think of the artistic value of a work of art is as the intrinsic value of the kind of experience someone has when they experience the work with understanding. A work is valuable as art to the degree that the experience it offers is valuable, not in virtue of any beneficial effects it might bring about, but in itself. What directly determines the artistic value of a work is not the values that are realised in the various *effects* of the experience, but those that are realised in the experience. A fine work of art is its own reward - it rewards in the very experience of it. The suitability of a work, when experienced with understanding, to reward the reader, spectator or audience, and the nature of the rewards on offer, determine the artistic value of the work. If the work is such that it merits being found intrinsically rewarding to experience with understanding, then the experience it offers is intrinsically valuable and, accordingly, the work is valuable as art.

3 Incommensurability

It does not follow from the fact that artistic value is a matter of degree that each work of art possesses artistic value to a *precise* degree, enabling the construction of an order of rank in which each work is either a precise amount above or below, or at exactly the same level as, any other work. In fact, if one work is better than another, it is never better by a definite amount. Moreover, artistic value does not impose even a unique ordering on works of art, for issues of comparative artistic value are sometimes indeterminate: it is not true that, for any pair of works, either one must be better than the other or they must be exactly as good as each other. Sometimes, but not always, the most that can be said about the comparative ranking of two works, whether of the same art form or of different art forms, is that they are of roughly the same order of merit. For example,Vermeer's *Head of a Girl* is undoubtedly a better work than Murillo's *The Young Beggar*, andMozart's *Symphony in G Minor* (KV 550) is better than Schubert's *Symphony in C Minor*; but if it is conceded that neither the Vermeer nor the Mozart can be said to be superior to the other, the insistence that they must be precisely equal in value imposes an unreal precision on the concept of artistic value. This is not because the works of Vermeer andMozart belong to different arts, for the Mozart is better than the Murillo and the Vermeer better than the Schubert. Rather, the incommensurability of artistic value and the indeterminacy of many issues of the comparative rank of works of art arises from the fact that there are many different kinds of quality that can endow a work with artistic value; there is no common unit that would allow the contribution of different kinds of quality to a work's artistic value to be measured; and even if there were, a quality that in one context constitutes an artistic merit can in other contexts detract from a work's artistic value by being combined in an incongruous manner with other qualities of the work, so that the contribution of a quality to a work's artistic value is not an individual matter but holistic.

4 Hume and Kant

A difficult problem arises concerning the implicit claim of a judgment of artistic value to interpersonal validity. How, if at all, might such a claim be well-founded? Both David Hume and Immanuel Kant attempted to answer this question. Each sought to identify a point of view, the adoption of which is definitive of artistic value. The chosen point of view defines this not merely by imposing on any individual a criterion that determines how *they* should judge, but by introducing a condition that determines how *everyone* should judge. The condition secures this result because, it is claimed, the achievement of this condition is - in virtue of the identical operation in each relevant person of the human faculties involved in the appreciation of artistic value - open to all, or to all relevant

persons, by the adoption of the indicated point of view: from this point of view human emotional response to a particular work is uniform.

Hume thought to reconcile the fact that a work’s artistic value (‘beauty’) is not a mind-independent quality but the projection onto things of the pleasure they induce with the intersubjective character of judgments of artistic value, by the exploitation of a supposed parallel between artistic value and secondary qualities - colour, for instance. Just as, he believed, though colour lies in the eye of the beholder, there is such a thing as an object’s true colour, namely the colour it appears in daylight to a normal human being; so, though artistic value is based in the human mind, a work has a single, true artistic value, determined by the pleasurable or unpleasurable response of a human being of a certain kind (a ‘true judge’), someone of superior discriminatory powers, who interacts with the work in the right way and in the right conditions.

Kant’s fundamental thought was that interpersonal validity of a judgment of artistic value is warranted only if such a judgment is not based on anything that might be idiosyncratic or not common to all other persons. By defining such a judgment as the product of a disinterested pleasure in a work’s form; by construing this pleasure as the experience of the free and harmonious play of the faculties of imagination and understanding, the two faculties that yield perceptual knowledge; and by maintaining the essential uniformity of the operation of these faculties for all people; Kant believed that he had established the validity of the claim to intersubjective agreement demanded by a judgment of artistic value (see Kant, I. §12).

So whereas Hume bases his account on the idea of a person of exceptional powers of discrimination, Kant relies upon what he takes to be common to our powers of perception. But neither Hume’s nor Kant’s solution commands assent. Apart from any other considerations, the reasons that each provides for believing in the (supposedly definitive) uniformity of response postulated by their theories are not compelling; and their attempts to capture the idea of a correct judgment of artistic value in terms of the pleasure that would be experienced by someone who interacts with a work in a certain manner under certain conditions appear not to do justice to the normativeness that is integral to the judgment.

The issue of the intersubjective validity of a judgment of artistic value - whether such a judgment can be valid for all people, and, if so, what validates it - has still not been adequately resolved.

5 Non-artistic values

There are many interesting questions about the relations between artistic value and other kinds of value, especially cognitive value and ethical value. For example: Is there an inherent link between the kind and degree of artistic value of a work and values of other kinds? Do certain other kinds of value *determine* artistic value in the sense that they are essential conditions of it? Are works (or works of a certain kind) with a high degree of artistic value naturally suited to support or enhance certain other kinds of value? Some thinkers have attempted to establish a particularly close connection between artistic value and certain other kinds of value, especially ethical value. For example, Tolstoy defined the activity of art as the transmission of a feeling from artist to audience by means of the artist’s creation of a suitable public vehicle, and he drew the conclusion that the better the feeling transmitted - the most valuable feelings being moral-religious ones - the better the work of art that transmits it. His attempt to moralize artistic value, however, like other such attempts, proceeds by way of a tendentious characterization of the nature of art.

6 Plato’s critique of art

Plato proceeded in an entirely different manner. Rather than offering a definition of art from which a favoured criterion of artistic value can be extracted, he merely held up against various artistic practices and accepted paradigms of good or great art *other* values, by which standards these practices and works were, he claimed, found wanting. This was not an unreasonable procedure. For a justification of the importance of art in human life would be best founded on an account of the importance of works that are good *as art*, and a critique of the value of art must undermine the claims of good and great art to a valuable role in our lives.

But isPlato’s famous dismissal of most forms of art from his ideal state, the Republic, well-founded? His attack on art is directed at all three of the central artistic roles, the artist, the performer and the audience or spectator, and it is based on a number of grounds. I shall sketch just one or two of the principal claims. A central allegation is that

the works of such representational artists as the painter and the poet are twice removed from Platonic Reality, for they are mere representations of things that are only specimens of what is truly real - namely, the archetypes (Plato's Ideas or Forms) of what is represented, which are timeless entities more real than any specimens of them and the objects of the highest knowledge. Furthermore, a picture is only an imitation of the visual appearance of what it depicts - it is designed to present to the beholder an appearance similar to that of its subject - and, accordingly, the painter, as such, is not an expert about the reality whose appearance art imitates: the painter knows only how things look, not how they really are or whether they are well-suited to their natural or intended function. Likewise, poets lack the expertise to perform well in the occupations or roles of the characters they represent in their works. So artists can produce only more or less plausible images of the natural and human world: they possess only the art of imitation, not real knowledge; their works do not express or encourage knowledge of the highest Reality, nor do they display any other knowledge worth having. Hence works of art are cognitively worthless. Now this would not matter so much if works of art were harmless, both cognitively and otherwise. Plato's most serious charge is that they are not. On the contrary, they stimulate and foster the inferior part of the soul at the expense of the superior. Pictures, being mere imitations of visual appearances, can appeal only to the nonrational element of the soul, and an indulgence of an appetite for pictures weakens the superior, rational element by strengthening the inferior. Thus although pictures are delightful, they are not beneficial, but are indeed harmful. Likewise, the other main form of mimetic art, poetry, and especially the art of tragedy, encourages socially undesirable feelings and attitudes in people. It corrupts even the better kind of person by eliciting powerful emotional responses to characters who are not really present but only artistically represented as being present, and in unleashing these emotions threatens to usurp the governing power of reason in the life of the person outside art. Accordingly, the appeal of poetry should be resisted; the ideal state will proscribe it, allowing only models of human excellence, hymns to the gods and praises of good men.

It is clear that Plato's fundamental concern in considering whether art should be welcomed or even admitted into a just society is the social value of works of art, that is to say, their value in promoting or hindering the development of socially desirable characteristics in members of a society. This is underscored by his advocacy of the censorship of poetic misrepresentation of the nature of gods and heroes. For it is not so much falsehood that he objects to, but rather the power of poetry to engender beliefs and attitudes that are not beneficial to society. He is willing even to suppress the poetic expression of the truth if this is necessary to preserve a well-governed society.

Plato's specific criticisms of the social value of representational art are unconvincing. I believe that his misgivings about the effects of the powerful arousal of emotions in response to the thoughts, feelings, actions and fates of dramatic characters were effectively answered by Aristotle in his *Poetics*, and that his other charges have little force (see Aristotle §29). But whatever the truth of this, it is clear that Plato's critique suffers from the generality of his claims about the effects of works of art, which he was in no position to verify. We should in fact reject altogether the question, 'What is the social value of art?' For there are different social values - qualities that it is desirable for members of a society to possess and value in others - and works of art have different social values, not only by being variously beneficial or harmful with respect to the same social value, but by enhancing or weakening different social values, which themselves are of greater or lesser importance to society, to a type of society, or to a specific society. Moreover, whether a work produces a certain social effect - one that it produces in some people, say - and the degree to which it does so, depends on the nature of the individual who responds to it, understands or fails to understand it, is moved or unmoved by it, and how often and in what conditions they interact with it. And what holds for social value holds, *mutatis mutandis*, for other kinds of value in so far as these values are determined by the actual effects of works of art on people, in the short- or long-term. The great variety of works of art, the different ways in which they achieve artistic value, the different temperaments, personalities, histories and capacities of individuals, make any global connections between artistic value and any values not intrinsic to the experience of works unlikely. A more convincing account thanPlato gives of art's tendency or capacity to further or hinder non-artistic values must therefore be more exploratory, less partisan, more various and founded upon both a deeper understanding of human nature and a recognition of individual intellectual and emotional differences that affect the influence of works of art on people.

Artificial intelligence

Artificial intelligence (AI) tries to make computer systems (of various kinds) do what minds can do: interpreting a photograph as depicting a face; offering medical diagnoses; using and translating language; learning to do better next time.

AI has two main aims. One is technological: to build useful tools, which can help humans in activities of various kinds, or perform the activities for them. The other is psychological: to help us understand human (and animal) minds, or even intelligence in general.

Computational psychology uses AI concepts and AI methods in formulating and testing its theories. Mental structures and processes are described in computational terms. Usually, the theories are clarified, and their predictions tested, by running them on a computer program. Whether people perform the equivalent task in the same way is another question, which psychological experiments may help to answer. AI has shown that the human mind is more complex than psychologists had previously assumed, and that introspectively 'simple' achievements - many shared with animals - are even more difficult to mimic artificially than are 'higher' functions such as logic and mathematics.

There are deep theoretical disputes within AI about how best to model intelligence. Classical (symbolic) AI programs consist of formal rules for manipulating formal symbols; these are carried out sequentially, one after the other. Connectionist systems, also called neural networks, perform many simple processes in parallel (simultaneously); most work in a way described not by lists of rules, but by differential equations. Hybrid systems combine aspects of classical and connectionist AI. More recent approaches seek to construct adaptive autonomous agents, whose behaviour is self-directed rather than imposed from outside and which adjust to environmental conditions. Situated robotics builds robots that react directly to environmental cues, instead of following complex internal plans as classical robots do. The programs, neural networks and robots of evolutionary AI are produced not by detailed human design, but by automatic evolution (variation and selection). Artificial life studies the emergence of order and adaptive behaviour in general and is closely related to AI.

Philosophical problems central to AI include the following. Can classical or connectionist AI explain conceptualization and thinking? Can meaning be explained by AI? What sorts of mental representations are there (if any)? Can computers, or non-linguistic animals, have beliefs and desires? Could AI explain consciousness? Might intelligence be better explained by less intellectualistic approaches, based on the model of skills and know-how rather than explicit representation?

1 Historical beginnings

Artificial intelligence (AI) researchers make two assumptions. The first is that intelligent processes can be described by algorithms (sometimes called 'effective procedures'), which are rules where each step is so clear and simple that it can be done automatically, without intelligence. This is an empirical hypothesis, which some critics of AI accept (Searle, in Boden 1990: ch. 3) and others reject (Penrose 1989). The second is that all algorithms can be implemented on some general-purpose computer. This assumption is generally accepted. It is based on the Church-Turing thesis, which states that a universal Turing machine, to which general-purpose computers are approximations, can compute any algorithmically computable function (see Church's thesis; Turing machines).

The best-known types of AI - classical AI and connectionism - share these two assumptions. But they differ in other ways (see §§2-4). Classical AI involves serial, or one-by-one, processing of (sometimes complex) formal instructions, whereas connectionism involves parallel, or simultaneous, processing among many simple units. Classical computation uses programs made up of formal rules to generate, compare and alter explicit symbol structures (see Mind, computational theories of; Language of Thought). Connectionist computation typically uses numerical (statistical) rules to determine the activation within networks of locally interacting units and, in systems that can learn, to alter the firing thresholds of individual units and the (excitatory or inhibitory) 'weights' on their interconnections. The system's 'knowledge' is contained implicitly in the constellation of connection weights (see Connectionism). Some philosophers use 'computation' to apply only to the classical type, first defined by Turing in 1936. AI researchers themselves normally use the term to cover both kinds of information processing.

Despite their differences, both these types of AI started from the same source: a seminal article written in 1943 by McCulloch and Pitts (Boden 1990: ch. 1). This discussion of ‘A Logical Calculus of the Ideas Immanent in Nervous Activity’ integrated three powerful ideas of the early twentieth century: propositional logic, the neuron theory of Charles Sherrington, and Turing computability.

The authors showed that simple combinations of (highly idealized) neurons could act as ‘logic gates’. For instance, a McCulloch-Pitts neuron with two inputs could fire if and only if both inputs were firing (an ‘and’-gate), or if only one input were firing (an ‘or’-gate), or if some specific input were not firing (a ‘not’-gate). Since every truth-function can be expressed with ‘not’ and ‘or’ alone, McCulloch and Pitts were able to show that every function of the propositional calculus is realizable by some neural net; that every net computes a function that is computable by a Turing machine; and that every computable function can be computed by some net. Their work inspired early efforts in both classical and connectionist AI because they appealed to logic and Turing computability, but described the implementation of these notions as a network of abstractly defined ‘neurons’ passing messages to their neighbours.

The neural networks discussed in this entry were extremely simple. For example, any link always had the same amount of influence, whereas most modern connectionist systems allow for continuous changes in the weight of each connection. But the authors’ theoretical ambitions were vast. Perception, reasoning, learning, introspection, motivation, psychopathology and value judgments: all, said McCulloch and Pitts, could in principle be understood in their terms. The whole of psychology would in future consist of the definition of various kinds of nets capable of doing the things minds do - that is, capable of computing the sorts of things which minds compute. Neurophysiology and neuroanatomy would show how networks are implemented in the brain, but psychology would define their logical-computational properties. Their views on the relation between psychology and physiology (or mind and body) anticipated later developments in the philosophy of mind (see Functionalism).

McCulloch and Pitts’ 1943 paper made AI possible in three ways. It influenced von Neumann, in designing the digital computer, to use binary arithmetic and binary logic (see Neumann, J. von). It gave both psychologists and technologists the confidence to model propositional (symbolic) reasoning, as opposed to only arithmetical calculation, on logic-based computers. And it inspired people to start studying the computational properties of various types of neural network. Although classical and connectionist AI are often described as utterly distinct paradigms, research in both these approaches commenced because of this paper.

Early connectionist work was further encouraged by McCulloch and Pitts in a paper of 1947. They pointed out that the brain is a parallel-processing device, not a sequential one. Moreover, it can function acceptably even when some cells misfire or die, or when the input signal is ‘noisy’. The perfect input data assumed within their first paper are, in real life, neither necessary nor often available. The question arises, then, how we (and animals) manage without them. McCulloch and Pitts described a statistical technique, based on differential equations like those of thermodynamics, whereby a parallel-processing system could compute (learn to distinguish) various patterns despite slight variations in the input. These (statistical) ideas were less biologically unrealistic than their earlier (logic-based) discussion. Nevertheless, the 1947 paper was less influential over the next three decades than their earlier work. Only in the 1980s did statistical, parallel-processing models achieve prominence (see §3 below).

2 Classical AI

Classical AI is the best-known type of AI, and is sometimes called traditional AI. It uses sequential programming (do this, then do that), and employs internal representations of lists, semantic networks, arrays and other information-processing structures. These representational structures and their components are interpreted as symbolic representations of propositions and concepts (or beliefs and ideas). Accordingly, this approach is also called symbolic AI.

Most internal representations in classical AI are language-like, being constructed from components each of which has some distinct causal-semantic role (though just which role may vary according to context). Some philosophers, such as Jerry Fodor, explain human mental states, or propositional attitudes, in terms of a hypothetical ‘language of thought’ having logical properties (compositionality, productivity, systematicity) like those exploited in classical AI (see Fodor, J.A.; Language of thought). A ‘toy’ example of one simple type of classical AI program (a production system) might look something like this:

If thirsty
then set goal to drink.
If current goal is drink *and* weather is cool
then set goal to seek kettle.
If current goal is seek kettle *and* not in kitchen
then go to kitchen *and* locate kettle.
If kettle is empty
then fill kettle with water.
If kettle is full
then put kettle on hob *and* heat hob *and* locate teapot.
(and so on)

As this toy example suggests, every action, and every condition for action, has to be explicitly specified. Actions that undo previous actions (such as emptying the kettle you just filled) must be avoided. Some unintended consequences of actions have to be anticipated and tidied up (turn off the hob). Default steps must be specified in case any precondition is not satisfied (hot weather, not thirsty). Goal-subgoal structure must be recognized, and the program must be able to 'pop up' to the top goal-level when the lowest sub-goals have been achieved or abandoned. Moreover (what the toy program does not show), procedures must be provided for carrying out the tests (is it cool, and is the kettle full?) and for executing the lowest-level actions (going to the kitchen, locating and filling the kettle) (see Rationality, practical).

Classical AI modelling is widespread in computational research. It is used to study, for example, problem solving, planning, vision, robotics, learning, natural-language understanding, analogy and the perception and performance of music (Boden 1987, 1988, 1990; Rich and Knight 1991). It is applied also to phenomena often assumed to be intractable for a computational (or even scientific) explanation, such as motivation, emotion and creativity.

Among the advantages of classical AI are its ability to represent hierarchical structure and to provide relatively transparent models (whose workings can be well understood by inspecting the program). A further advantage is that it can define 'strong' (exceptionless) problem constraints. It is sometimes forgotten, especially by proponents of connectionism, that strong problem constraints are often needed. For instance, every sentence must have a noun phrase and a verb phrase; and waltz time in music demands that each bar have exactly three beats. Admittedly, a composer may produce some anomalous bars (for example, having only two beats in the upper voice along with three in the lower); but one cannot keep doing this, or break out into march time, without abandoning the goal of composing a waltz. Nor can one communicate intelligibly if one omits most noun phrases. Given that certain rules are mandatory, an AI system should respect them, not approximate them by blurring them with others.

Although it began no earlier than connectionism, classical AI achieved visible success before parallel-processing models did. The first major successes occurred in the 1950s. The logic theorist and general problem-solver of Newell and Simon introduced 'means-end analysis', wherein a program analyses the problem as a hierarchy of goals and sub-goals (on indefinitely many levels) and chooses the action most likely to reduce the difference between the current state and the desired state (the goal). This method was widely adopted in theorem proving, problem solving and planning. Another early landmark was Samuels' draughts (checkers) player, which played well and even learned to adapt to its opponent's individual style. And early language-using programs used stored English word strings and simple linguistic schemata to conduct 'conversations' in which the human interlocutors were occasionally (if briefly) persuaded that they were interacting with another person. (See Feigenbaum and Feldman 1963.)

By the early 1970s there had been considerable advance. For instance, natural-language processing could now be sensitive to highly complex syntactic structure or to the unspoken assumptions hidden in the semantics underlying the actual words - so that programs could 'answer' questions about things not explicitly mentioned. Machine learning was sometimes achieved through the program's having a model not only of the task domain but also of its own action strategies - which, with experience, it modified. Other advances followed. Various high-level AI programming languages were developed, such as LISP ('list-processing language') and PROLOG ('programming in logic'). And Newell and Simon developed 'production systems', a programming method based on if-then (condition-action) rules: if the condition is satisfied, then the action is taken. The condition may be a complex

conjunction or disjunction, including (sometimes) a statement of the system's current goal; similarly, the action may be complex and/or internal (see the toy AI program above). These developments affected both technological and psychological AI. Production systems, for instance, are the core of most 'expert systems', but were originally proposed as a model of human thinking. (An expert system is an AI program consisting of a set of 'If… then' rules, which can be used to aid human beings in solving specialist problems such as locating oil, planning a travel itinerary or diagnosing a disease.)

3 Classical AI and human thinking

Traditional AI began with the assumption that symbolic logic is a normative model for both human and automated reasoning (see Common-sense reasoning, theories of). This assumption sits well with some forms of reasoning, such as theorem-proving (although even there, human beings sometimes employ non-logical methods, such as imagery and analogy). But most human reasoning is approximate and qualitative. We can understand speech even when it is ungrammatical, heavily accented and partly obscured by noise; and we can recognize imperfect handwriting, shadowy scenes, and perceptual or linguistic analogies of many kinds. Also, we can use world knowledge in solving logical problems and in deciding whether strictly logical reasoning, as opposed to fallible heuristics based on experience, is appropriate in a given case. For example, even teachers of logic can solve a problem concerning rules of postage (reversing a minimum number of envelopes to inspect the postage stamps) more easily than a problem of identical logical form posed in abstract terms. In short, we have common sense (see Rationality of belief; Common-sense reasoning, theories of).

Work in AI has increasingly focused on common-sense reasoning, not least because classical AI systems tend to be 'brittle'. If data are missing or corrupted, a classical AI program may give an absurd answer, or none at all. For example, a story-writing program may allow a character to drown a few feet away from a potential rescuer on the river bank, because the programmer did not explicitly include the information that one is normally able to see whatever is going on in front of one's eyes. Similarly, an expert system might ask whether a particular three-year-old girl has any children, not knowing that pre-pubertal girls cannot conceive. People know many such facts about the world and often give something near the right answer (a good guess) even when they lack some relevant information. So AI research has studied probabilistic reasoning, non-monotonic logic (where not-*p* may turn out to be true even though *p* had been proved earlier), case-based or analogical explanation, deep (causal) reasoning, and common-sense semantic networks and belief systems (see Non-monotonic logic). As these new methods are incorporated into classical AI programs, the brittleness typical of first-generation AI models (for example, the rule-based 'expert systems' used by many commercial and public institutions) should be reduced.

To reduce brittleness, however, is not to avoid it entirely. Some critics believe that classical AI methods will never model everyday human thinking. A leading AI logicist has recently recanted (McDermott, in Boden 1990: ch. 9). Classical AI has been criticized also by philosophers who reject the Platonist assumption that all truths are analysable in terms of formalizable elements (Dreyfus 1979). Some philosophers see connectionism as immune to philosophical critiques of classical AI (see §3 below), while others regard it as acceptable only up to a point (Dreyfus and Dreyfus, in Boden 1990: ch. 13).

For AI to be deeply relevant to theoretical psychology and the philosophy of mind, it need not promise actual replication of all human behaviour. So someone (such as Fodor) who propounds a computational philosophy of mind may, without contradiction, doubt whether AI systems could ever in practice achieve more than a tiny fraction of human behaviour. Nor need AI researchers themselves believe in this possibility. They may allow that certain behaviour cannot, in principle or in practice, be replicated by AI (of any type). Moods, for instance, may be unreplicable in principle, and superb novel-writing may be unachievable in practice.

Even AI workers who do believe that full replication is possible need not accept the Turing test (see Turing, A.M. §3) as their criterion of intelligence. They all allow that a non-mental thing could sometimes fool us into thinking it intelligent; indeed, this happened so often with ELIZA, an early language-using program, that this user illusion is called the 'ELIZA effect'. And some, for example, argue that mere replication of behaviour, without evolutionary descent of the underlying causal mechanisms, would not suffice for true understanding.

One well-known philosophical critic of AI, especially (though not exclusively) in its classical form, is John Searle (see Boden 1990: ch. 3; Chinese room argument). Searle argues that even if an AI model passed the Turing test

(which he thinks is in principle possible), it would not really be thinking, or understanding, anything. Correlatively, a computational psychology could not explain how we can understand: at best, it could explain what we do with meanings once we have them. He argues that programs are defined purely syntactically (by formal rules defined over formal constituents), whereas intentionality - or meaning - involves more than mere syntax. Searle's argument has been challenged in many ways by philosophers and AI scientists, and remains controversial. Most opponents accept his assumption that computation is purely syntactic, disagreeing with him on other grounds. However, this assumption is also controversial (see Boden 1990: ch. 4). The nature of computation - and its connection with meaning - is less clear, and less universally agreed, than Searle supposes (see Language of thought).

More generally, many philosophical critiques - and defences - of AI turn on issues of semantics (not behavioural replication). But philosophical semantics is itself disputed. To speak of 'information processing' is problematic, because the nature of information is controversial (see Semantics, informational). Similar remarks apply to symbol manipulation. Other connected issues include whether meanings are 'in the head' (semantic internalism) or partly constituted by the things to which they refer (externalism) (see Content: wide and narrow), and the relevance (if any) of evolution in establishing meaning (see Semantics, teleological). Even within AI, researchers give differing accounts of semantics (and not all AI workers subscribe to 'strong AI' as Searle defines it). Some, for example, accept a procedural semantics wherein the execution of particular computations, or mini-programs, suffices for particular meanings (see Semantics, conceptual role). Others see causal interaction with the external world (and even evolutionary history) as necessary for meaning. In short, the semantics of AI are controversial both within and outside the field.

4 Connectionism and hybrid systems

Connectionist models are parallel-processing systems, involving mutually interactive computations grounded in local interactions between connected units (see Connectionism). Each individual computation is much simpler than a typical instruction in a classical AI program. Even so, connectionist units and computations (and learning rules, if any) vary significantly.

For instance, the semantic interpretation given to connectionist units by AI researchers differs. (This is true irrespective of philosophers' theories about semantics, and the relation of AI and meaning.) Some connectionist units are described as computing the truth-values of entire propositions; others are intended to code familiar concepts. The representational role of these units is thus comparable to the rules and rule components in the toy AI program in §2 (however, connectionist systems cannot specify action hierarchies, like that outlined above for quenching thirst). Yet other connectionist units stand for detailed subsymbolic micro-features, which are not always expressible in terms of everyday concepts or symbols. Thus an input unit might code for a tiny patch of a highly specific (unnamed) shade of purple.

The symbolic/subsymbolic distinction, so defined, is sometimes thought to distinguish (all) connectionist from (all) classical AI. This is a mistake. The distinction is vague: just which concepts count as everyday concepts? Moreover, not all connectionist systems employ subsymbolic processing, and many classical AI programs, especially in vision and natural-language processing, code for subsymbolic microfeatures. The distinction is better defined in terms of the presence or absence of causally efficacious and semantically evaluable logical constituents. Such (symbolic) constituents typify classical AI. Subsymbolic units (in this sense) have no fixed, context-free interpretation, since their effect on processing varies according to the simultaneous activation of the other units.

In the late 1950s and the 1960s, classical AI progressed faster than connectionism. None the less, some researchers persevered with early forms of connectionist modelling. But in 1969 Minsky - widely acknowledged as a father of classical AI, but also the first person to build a connectionist learning machine - proved surprising limitations on what very simple networks ('perceptrons') could compute (see Minsky and Papert 1969). Although he stated that more complex networks might be more powerful, there was a marked drop in interest in connectionist research.

A few individuals within AI, and some in psychology and physics, worked on connectionist systems during the 1970s and early 1980s. But not until 1986 did connectionism attract substantial attention. In the late 1980s it hit the headlines and attracted attention from philosophers, being widely hailed as a new, all-powerful computing methodology. More accurately, one specific type of connectionism attracted attention (others being largely

ignored): ‘parallel distributed processing’ (PDP). In a distributed connectionist system, a concept is not stored by a single unit (as in localist connectionism). Rather, it is represented by a global pattern of activation spread across the entire network, many different units making some contribution. It may be impossible to assign a specific, context-free interpretation to a given unit. Moreover, no individual unit is either necessary or sufficient for the whole network to represent some particular concept (recognize some particular pattern).

PDP models themselves vary in important ways. Not all employ subsymbolic processing, though most do. Some allow only for on-off variation in the activity of each unit, while others allow for continuous weights defining the unit’s influence. Not all PDP models can learn, though most can. Those which can learn employ various learning rules. The number of units can vary, with significant implications for the type of learning achievable. And although most PDP systems have only ‘feed-forward’ connections, passing from units nearer the input to units nearer the output, some have backward links also (called ‘back-propagation’). In general, PDP systems work by adjusting the simultaneous activity of the constituent units until some global equilibrium is reached (different concepts are represented by different equilibria within the same PDP system). This is achieved not by a sequence of symbolic rules, but by numerically described statistical processes like those of thermodynamics. The changing states of the system are described not as symbol structures (such as lists), but as numerical vectors.

Because of their statistical design, PDP systems are better able than classical models to perform well despite noisy input, and to retrieve an entire memory given only a fragment. Some classical AI programs can do this too, up to a point, if specifically pre-programmed to do so. PDP models, by contrast, ‘naturally’ achieve a plausible end-state given partially conflicting evidence, weighing both strong and weak constraints (and the extent of their mutual coherence). That is, they perform multiple constraint satisfaction, where the information may be partially conflicting and/or missing. And PDP systems with learning rules (which change the activation weights on the connections with experience) can learn -as people can - from being shown a range of examples.

PDP models are unlike real brains in many ways. For instance, the widely used back-propagation algorithm learns in a very un-biological fashion. Less neurophysiologically unrealistic forms of connectionism have been developed, but even these fall far short of neural networks in the brain.

Another drawback of first-generation PDP systems is that, unlike classical AI programs, they cannot model hierarchical structure or sequential processing. Some types of human thinking - many aspects of language and problem-solving, for example - require both these features. Most AI researchers use only classical, or only connectionist, models. This sociological fact has encouraged some philosophers to exaggerate the differences, and the supposed superiority of one approach over the other. However, these AI methods have complementary strengths and weaknesses. Accordingly, there is growing interest in hybrid models, which try to get the best of both worlds.

Various philosophers use connectionist ideas in addressing important philosophical problems. These include symbol grounding, the problem of how words and concepts acquire meaning (Cussins, in Boden 1990: ch. 15); the role of folk psychology in cognitive science (Clark 1989); family likenesses, paradigm cases, and prototypes of concepts (Clark 1993); eliminative materialism (Churchland, in Boden 1990: ch. 14); and scientific explanation (Churchland 1990). Many philosophers see affinities between connectionism and Wittgensteinian views of language, because connectionist representations are not cut and dried like those used in classical AI but allow for borderline cases and for varying degrees of similarity.

5 Situated robotics and anti-representationalism

Classical and connectionist AI share a commitment to internal representation as integral to intelligence. Both these approaches (and most cognitive scientists) posit identifiable data structures ‘in the head’ that are distinguishable from the system’s processing (which is done ‘on’ or ‘with’ them), and that stand for things in the world. This commitment has been (controversially) abandoned by AI work in situated robotics (Boden 1996; Maes 1991). Situated robotics is sometimes termed ‘*nouvelle* AI’ (in contrast to traditional AI), or ‘behaviour-based AI’ (in contrast to AI based on abstract task decomposition). It claims to be more biologically realistic than classical AI. It emphasizes ‘autonomous’ systems specifically adapted to their environment, not general-purpose computers controllable by many different programs. And it builds whole (sensory-motor) systems, rather than decomposing intelligence into distinct tasks (vision, planning, motor action) which then have to be integrated to provide a

functioning robot.

Situated robotics avoids using internal representations of the external (objective) world, although some systems use temporary representations of their own (subjective) place in or actions on their immediate environment. And it uses a bottom-up approach to generate complex behaviour. Because the environment is assumed to be noisy, dynamic and inconvenient, the detailed world-modelling and top-down planning typical of classical AI are rejected. No complex program is involved to decide on, monitor and control the creature's activities. Instead, the control of behaviour flows from the nature of the system itself, in the sense that the system is engineered (not programmed) to respond to environmental triggers in certain ways. By these means, researchers in situated robotics seek to avoid the notorious 'frame problem' (Boden 1990: chaps 7-9). This problem bedevils AI work on robot planning, language understanding and common-sense reasoning. It concerns foresight of the many intended and unintended consequences of action. For instance, if a box is moved across the floor then all its contents move also, whereas the chairs (and table and curtains) do not. A formal representation of action must explicitly allow for *all* the intended effects, or some may not happen. And the action's many unintended effects will be wholly irrelevant only if the agent is very lucky, or very thorough in explicitly anticipating potentially relevant outcomes.

Classical robots rely on planning, done within an internal world model. To avoid the frame problem, they must explicitly anticipate a host of intended consequences and unintended side-effects. Although this exhaustive listing of consequences is feasible in artificially impoverished environments, it is impractical in the real world (the thirst-quenching program in §2 would often lead to disappointment, because of unexpected facts about the house concerned). Moreover, because the real world cannot be relied on to remain unchanged, detailed anticipatory plans may fail on execution. Instead of manipulating complex internal representations of the world, situated robots deal directly with it. Situated roboticists eschew the abstract functional task-decomposition employed by classical AI. Instead, they analyse intelligence in terms of 'behaviours'. Their robots engage in simple, hardwired behaviour triggered by specific, ecologically relevant, environmental cues.

The anti-representationalist stance of *nouvelle* AI is controversial. Some situated robots use temporary representations that are not objective but 'deictic' (subject-centred), being closely bound to the robot's behaviour in *this* place on *this* occasion (see Content, indexical). Admittedly, some situated robots - including some of those which show apparently 'cooperative' behaviour, like that of some social insects - do not employ representations even in this sense. Instead, they are engineered to respond directly to certain conditions, without the central world-models favoured by classical AI. Nevertheless, whether human, or even much animal, intelligence can be modelled without internal representations of any kind is unclear.

Evolutionary AI uses genetic algorithms (GAs) to improve programs by artificial evolution. Evolution involves replication, random variation, and selection. GAs make random changes within a program, and (at each generation) identify the most efficient of the resulting rules. These rules are then assigned a high probability of 'breeding' the next generation. Eventually, a system evolves which is efficient, perhaps even optimal. This technique is widely used within classical AI, for inductive problem-solving and classification (Holland *et al*. 1986) and for evolutionary art - GA-directed computer graphics, or music - where the selection at each generation can be done by the human user (Todd and Latham 1992). GAs are used also for evolutionary robotics (in which the robot's design is automatically evolved), and for other work in artificial life, which studies self-organizing, self-replicating adaptive systems (Boden 1996).

6 The neo-Heideggerian challenge

Most AI researchers presuppose the Cartesian distinction between the mind as psychological subject and the real world as object of the mind's (representational) thinking (see Descartes, R.; Dualism). On this view, intelligence is located in the brain, for perceptual input from the world is followed by inner thinking, which in turn causes motor action. Organisms (and artefacts) are assumed to be located within, and adapted to, an environment whose properties are independent of any perceptions of it. Different creatures perceive and affect different world properties. But those properties are objectively there, independent of creatures' relations to them.

These neo-Cartesian assumptions have been questioned by philosophers drawing on Wittgenstein, Heidegger and phenomenology (see Dreyfus 1979; van Gelder 1995). Similar questions have been raised within AI and cognitive science. For instance, some work in situated robotics and artificial life offers an anti-Cartesian critique of

mainstream (classical and connectionist) AI. Such critics reject the subject-object distinction, theories positing internal representations, and the notion of intelligence as a causal series (perception, then thought, then action). Instead, they see organisms as dynamic systems closely coupled with their environment, which (so they argue) cannot be independently defined (see Port and van Gelder 1995; van Gelder 1995; Varela *et al*. 1991; Wheeler, in Boden 1996; Content: wide and narrow). 'Coupling' is a relation of simultaneous mutual causation whereby two systems constantly interact and interpenetrate, each causing changes not only in the other's superficial behaviour but also in its background parameters. If this interpenetration were wholly chaotic, we could not identify two systems. We can (approximately) distinguish systems, and subsystems, only when certain states are relatively stable through time.

Intelligence, on this view, is a function not of the brain but of the whole system constituted by nervous system, body and environment. Likewise, depth vision is a function not of a tiny region of cells, but of the whole visual cortex - indeed, of the entire brain. Computationalism, though not computer modelling, is rejected. It is replaced by dynamic systems theory drawn from physics, which employs differential equations rather than discrete algorithms, and focuses on intrinsic physical states (described by numerical vectors) rather than symbolic representations. (Strictly, since a dynamic system is one whose changes of state can be described by some rule, classical AI programs are a special case; however, real time and/or continuous variables do not feature in classical - or most connectionist - AI, whereas they do feature in the dynamic theories of physics.)

This anti-Cartesian challenge is highly controversial, both scientifically and philosophically. In scientific terms, dynamic systems theory (like first-generation connectionism) is largely a promissory note. Certainly, organisms are dynamic systems - but we need to know how this explains the specific phenomena of human and animal intelligence. Such explanations will require concepts at a higher level than dynamic systems in general.

Artistic expression

Many kinds of psychological state can be expressed in or by works of art. But it is the artistic expression of emotion that has figured most prominently in philosophical discussions of art. Emotion is expressed in pictorial, literary and other representational works of art by the characters who are depicted or in other ways presented in the works. We often identify the emotions of such characters in much the same way as we ordinarily identify the emotions of others, but we might also have special knowledge of a character's emotional state, through direct access to their thoughts, for instance.

A central case of the expression of emotion by works of art is the expression of emotion by a purely musical work. What is the source of the emotion expressed by a piece of music? While art engages its audience, often calling forth an emotional response, its expressiveness does not consist in this power. It is not because an art work tends to make us feel sad, for instance, that we call it sad; rather, we react as we do because sadness is present in it. And while artists usually contrive the expressiveness of their art works, sometimes expressing their own emotions in doing so, their success in the former activity does not depend on their doing the latter. Moreover, the expressiveness achieved has an immediacy and transparency, like that of genuine tears, apparently at odds with this sophisticated, controlled form of self-expression. It is because art presents emotion with simple directness that it can be a vehicle for self-expression, not vice versa. But if emotions are the experiences of sentient beings, to whom do those expressed in art belong if not to the artist or audience? Perhaps they are those of a fictional persona. We may imagine personae who undergo the emotions expressed in art, but it is not plain that we must do so to become aware of that expressiveness, for it is arguable that art works present appearances of emotions, as do masks, willow trees and the like, rather than outward signs of occurrent feelings. Expressiveness is valuable because it helps us to understand emotions in general while contributing to the formation of an aesthetically satisfying whole.

1 The expression of emotion

Thoughts and attitudes can be expressed. My concern here, though, is with artistic expressions of emotions, feelings and moods. I shall consider what and whose emotions are communicated in art, and the nature of expressiveness in art works.

Sometimes a person's expressions are distinguished from their dispassionate reports of their emotions (because the emotion is not directly present in the utterance). Also, expressions might be separated from uncontrolled ventings of emotions, these latter being regarded as symptoms, like the spots of measles, that betray or symptomize the condition without expressing it. My own approach is more liberal. I count as an expression any behaviour or display that communicates the agent's emotion, feeling or mood. Such instances of behaviour might be unintended and unthinking, or deliberate and self-conscious. (Indeed, their expressive character might depend on their being the one rather than the other. If my weeping is deliberate and controlled, this suggests pretence rather than expression; if my behaviour is unintended, then it cannot involve the use of social conventions for expression, even if it seems to match these.)

Typically, emotions depend on causal circumstances, take intentional objects and involve beliefs and desires (or make-beliefs and make-desires) concerning that object. For example, I hope for peace at a time of conflict because a treaty has been signed and because I believe treaties lead to the cessation of hostilities, which is what I desire. A person's emotion might be apparent to another who possesses knowledge of any suitable combination of these elements.

In some cases, a person's nonverbal actions alone will indicate that they feel an emotion. In fewer cases - those in which an emotion has an unambiguous mode of nonverbal expression - actions alone might indicate that a particular emotion is experienced. (Perhaps only the broadest categories for happiness and sadness have patterns of behavioural expression sufficiently distinctive for this to be the case; cognitively complex emotions, such as hope or jealousy, have many behavioural expressions none of which is distinctive.) More often, behaviour expresses the agent's emotions only where the wider context is known.

There are further possibilities for the communication of emotion: one can learn of a person's emotions from true

descriptions of them given by knowledgable third parties, or from their own sincere reports. If emotions can be individuated solely by their sensational character and the dynamic structure of their phenomenology, one’s knowledge of the detail of a person’s ‘internal’ experience could communicate their emotions. Finally, note that the expression of emotion has a social, arbitrarily conventional dimension. In some cultures, for instance, the wearing of black clothes and veils is an expression of grief or respect for the dead. The relevant conventions must be followed deliberately and sincerely if the resulting actions are to express an emotion the person feels.

2 Characters in works

If the work contains characters (for example, through depiction or description), then these characters might experience emotions to which their behaviour or circumstances give expression. Unless the audience is given reason in the work’s contents, its genre, or the context of presentation to make-believe otherwise, it is to assume that the beliefs, behaviour, bodily attitudes and causal circumstances of the work’s world correspond to those of the actual world. Accordingly, the audience can learn what emotions the work’s characters experience in the same manner as it recognizes the emotions communicated by others in the ordinary world, except that the audience’s relation to the world of the work depends on make-believe rather than belief.

Some differences are worth noting, however. In the case of narratives written in the first person, the audience might come to know ‘from the inside’ what a character experiences or believes, and hence what they feel, even if that feeling is not outwardly indicated. Second, the protagonists might be non-human or unreal concoctions, such as elephants or intelligent ants. In considering the emotions of such creations, information about their point of view will be relevant - their cognitive commitments and values, their vulnerabilities and aspirations, their intellect, physiology and the like. In addition, artists create expressive contexts that do not or could not arise in the actual world. For instance, the use of leitmotiv in opera to recall actions or words might reveal that a character’s passion is meant for X despite being directed at Y. Quotation and reference, both within and between works, might establish an expressive ambience one would not normally find or look for.

In addition to the emotions of their characters, art works seem to embody and express emotions of their own. This applies to all kinds of works but is perhaps most striking in abstract pieces, including pure music, where expressiveness is present in the absence of a narrated or depicted content. Whose emotions are expressed thereby and how are they expressed?

3 Arousal theory

One suggested answer to the above question is that we ascribe emotions to art works just because those emotions are awakened in us. This is the theory of emotivism or arousalism. Two cases need to be distinguished. In the first, the art work or some aspect of it is the emotional object of a response in the standard way. As a result of realizing that a character in a work is dying unloved one feels sadness for and pity towards that character. Or, believing that the dramatic potential of the last act was botched by the playwright, one feels disappointed by the play. Or one is delighted by the felicity of a turn in the melody. In the second case, one tends to respond with sadness to works called sad, or with happiness to works said to express happiness. Something in the work calls forth the reaction that mirrors the work’s expressive character. One does not then feel sad or happy *about* the work; indeed, the response seems to lack an emotional object, though the work is its perceptual object and cause.

Arousalism refers to this second kind of response in analysing artistic expressiveness: an art work expresses an emotion if and only if it has the power to arouse or tends to arouse that emotion without an object in an appropriate audience. In this view the sadness of the art work is like the greenness of grass; some property of the thing in question disposes it to affect the experience of those perceiving it. The sadness is attributable to the art work, not to the person in whom the feeling is aroused, because the work has the power to awaken the same feelings in a variety of suitably qualified perceivers. Similarly, we say it is the grass that is green, not the perceiving of it, just because its effect on perceivers is largely indifferent to their individuality and idiosyncrasies.

The arousal theory faces two main lines of objection. The first, pursued by Peter Kivy (1989), denies that there are any objectless responses of the kind described - sad music, for instance, never leads listeners to feel sad. A more plausible objection denies the match (postulated by arousalism) between artistic expressiveness and the audience’s tendency to respond. The audience might be unmoved, or might not feel what the work expresses,

despite their correctly recognizing its expressive character. In reply to this, the arousalist points out that a tendency to respond can be blocked or inhibited - for example, where one is distracted from or overexposed to the given piece, and so on. In some cases contemporary values and sentiments might permanently block the tendency that would have triggered a response at the time of the work’s creation. Though it might deal with some counterexamples, I am doubtful that arousalism successfully accounts for all the mismatches between artistic expressiveness and audience’s reactive tendencies, where these threaten its plausibility.

One can reject the arousalist account of artistic expressiveness while accepting that sad works sometimes evoke sad reactions. One might explain the echoing response as occasioned by the work’s expressiveness. Whereas arousalism holds that art works are sad because they make us feel sad, one might instead maintain that it is because they are sad that we respond as we do. We find the emotional moods of others contagious, even if we are not aware of having anything to be happy or sad about; perhaps we react to art works similarly. And perhaps we are open to this mode of response because we approach art as human communication.

4 Expression theory

In creating their works, do artists express feelings? Surely this is often so. In that case, are the emotions expressed in art works those of their artists? We approach many works, including abstract ones, as dealing not merely with the affective side of life but with personal feelings. One view, the expression theory, asserts that expressiveness can be attributed to art works only where there is this discharge of feeling, and because of it: art works are expressive because they stand in relation to artists’ occurrent emotions as do tears to sadness, as both arising from and revealing the feeling. Just as emotions are presented immediately and transparently in genuine tears, so that no inference from crying to sadness is required, we experience the expressiveness of art as residing in it. Also, we find the expressiveness of art works highly evocative of sharing or empathic reactions and this is how we respond to open, primary displays of emotion.

Despite its attractions, the expression theory seems to fail by entailing that when an art work expresses an emotion, the artist experienced that emotion. This generalization is patently false. The process in which art works have their genesis allows little scope for unthinking expression or for undergoing emotions powerful enough to produce the outcome as described. Moreover, some artists turn to creation to escape their traumatic circumstances and, in doing so, produce works that do not reveal the emotions dominating their lives at the time. The expressiveness of art works is usually achieved by their artists, but this happens typically by design. So structured and conventionalized is art, and so practical is the knowledge brought to its creation, that the making of art, even of an expressive variety, cannot continue long or far without reflection, including attention to technique, detail, the nature of the medium and overall structure. Besides, art works are not the kinds of things that arise causally or naturally as immediate, transparent expressions of occurrent emotions. A tendency to create art, unlike a tendency to tears, is not an essential part of sadness, so art works should not be the kind of thing from which sadness can be read directly. In a few cases an artistic action transfers its character to the product that results - violently produced brushstrokes often display the energy that went into their making. But in general, artists’ creative acts, even where these are impelled by emotions, are not such as to transfer that expressive character directly to the resulting piece.

The theory fares no better if performers (should the work have them) are substituted for artists, or where the approach is counterfactual in suggesting that a piece expresses such and such if it is the kind of art work that a person feeling such and such would create. The first alternative encounters objections like those confronting the original theory. The second presupposes art’s expressiveness, without analysing it; one could recognize the work’s aptness for expression only if it already independently displays the appropriate character.

Now, how could it be that art works display expressive directness while expressing the artist’s feeling if they do not relate to that feeling as tears relate to sadness? One way this could be achieved would be by the appropriation of something that itself possesses or simulates the immediate, primary presentation of feeling. For instance, a grieving person might employ professional mourners to weep on their behalf, or might show how they feel by deliberately putting on a sad face or by pointing to a mask of tragedy. Artists, in a similar fashion, might express their feeling through those of characters in the work or by matching the expressive tone of the work to their feelings. But in either case, the expressiveness present in the work has its character independently of the artist’s use of it, so expressions of artists’ feelings through the works they create presuppose, rather than explain, the expressiveness of those art works.

One version of the expression theory that has been influential in the recent history of aesthetics is that propounded by Benedetto Croce §2 and R.G. Collingwood §3. In outline, their account is this: the process of artistic creation is one in which, through the articulation of inchoate feelings and impulses, the artist comes to express a particular, unique emotion, thereby bringing it to their conscious awareness. The emotion is constituted through the act of expression, having no prior identity; that is, the emotion achieves its particular character through the manner of its expression. Collingwood regards art as expression at the level of imagination; for Croce, art is intuitive expression. Both tend to dismiss creation that does not satisfy this model as not truly artistic.

The impression that this view offers an account of the psychology of the creative process and not of the nature of the art work is misleading, for the work is regarded as primarily mental, as existing in the artist's mind and inseparable from the act of expression. The artist might work in a physical medium on a public object as they create the work, but this is not necessary, and a work can be created without being 'externalized'. Externalization is crucial, though, if the artist wishes to communicate the work to others. The object then created is not strictly the work, but the vehicle by which an awareness of the work can be transmitted. Communication is successful when the audience comes, through contemplation of the public object, to recognize or share the mental condition that is the work's existence. Collingwood denies, however, that it is the function of art to arouse emotion. Artists could pursue that goal only if they knew what emotion they wanted to arouse, and such knowledge comes only with successful expression and, hence, after the work's completion. Accordingly, art is primarily concerned with the self-awareness accomplished by the artist through their act of self-expression.

As an account of the creative process, which is much more variable than is specified, the theory is too narrow, and in so far as it applies to activities not normally regarded as issuing in art works, such as formulating and clarifying one's thoughts in language, it is also too broad. Second, in according primacy to the private, mental dimension of affective experience and in treating public expressions of emotion as dispensable ancillaries, the theory's account of expression is questionable. In addition, it leaves under-explained the process by which an audience comes to know the work and its expressive character. How do we map elements of the work's externalization to mental states and processes, thereby recreating those of the artist? Finally, in its account of the response appropriate to the appreciation of works of art, the theory seems at odds with the widespread view that most works admit a variety of interpretations and responses.

To the extent that it downplays the public context of presentation and appreciation, as well as the social determination and significance of artistic conventions, practices and genres, the account is committed to an uncomfortably idealist ontology for art works. It disregards the close identification we make in the case of singular pieces, such as oil paintings, between the work and the physical object in which it is realized. We speak of the properties and fate of such a work in terms of the qualities possessed and the vicissitudes undergone by that physical object. Art works are not deprived of their existence by the death of the artist, and their properties do not fade along with the artist's memories of its creation. Also, the theory cannot readily acknowledge the importance we accord to the artistic contribution of the performer in art forms such as drama, music and ballet. In general, the theory underplays the way in which the physical properties of a medium affect a work's artistic character by presenting distinctive possibilities and problems for the artist; or, to the extent that it admits such considerations, the account undermines the distinction it emphasizes between the (mental) act of creation and the (dispensable) activity of providing a public externalization of the work.

5 Fictional authors and personae

In the case of narrative or depictive works, it might be appropriate to regard the work as a communication from a fictional narrator or viewer, rather than from its artist. In line with critical practice, such an approach more readily tolerates the multiplicity of legitimate interpretations and the attribution of ideas and meanings to the work that were not held or intended by its artist. This fictional person, who stands outside the work and is distinct from its characters (including its internal narrator, should it have one), is constructed by the audience on the basis of the work's contents and conventions relating to what can be known and assumed in interpreting a work of the relevant time and place (see Narrative §2).

Once this strategy has been adopted, it will be natural to attribute to the fictional narrator or viewer attitudes and emotions expressed in the manner of the work's presentation, as well as beliefs and desires. For instance, we might

learn from the story that a character feels pride, but from the tone in which this is described also that the fictional narrator regards this pride as disappointing and contemptible. In that case it could be said that the fictional narrator is disappointed in the character's behaviour, even if there is not sufficient warrant for extending this reaction to the work's artist - indeed, even if there is reason to think the actual author might have had a more detached or ironic view.

The interpretive procedure outlined above might be extended to works that are neither narrations nor depictions, so that the expressiveness of such pieces is attributed to a fictional persona (whose thoughts and beliefs are largely absent from the expressive context). The work is approached, if not as a story, then as dealing piecemeal with the emotional experiences of a person about whom one knows little except that they undergo an emotion or sequence of feelings, the course of which is revealed in the work's contents and structure.

One might hear, say, a symphony as conveying the feelings of a fictional persona, but is this necessary for one to be aware of the work's expressiveness? If words for emotions always name the experiences of sentient beings, it might be thought that some such make-believing is involved, unconsciously if not consciously, where the work's expressiveness is not attributed to its artist, performer or audience, or to a character within it. Alternatively, if expressiveness can be present in the absence of occurrent emotions, this approach might be gratuitous.

6 Expressiveness as a property of art works

Several attempts to divorce the expressiveness of art works from expressions of occurrent feelings are unconvincing. We do sometimes say that art is expressive without indicating what it is expressive of. But, unlike Scruton (1983), I do not think that art deals with a kind of expression that is not the expression of an emotion or the like; rather, it reveals our concern (sometimes) to highlight the manner of a thing's being expressive, or the subtlety of its expressive nuance, above identifying or classifying the content of that expressiveness. Also unsatisfactory is the suggestion that art expresses emotions that are *sui generis* in being unfelt and non-cognitive, for this view, in divorcing artistic expressiveness from the world of human feeling, makes inexplicable art's power to move us as it does. And the supporting claim that art's expressiveness is ineffable is misplaced (in confusing description with duplication) and exaggerated (because it is only at a rather general level of expressiveness that there is sufficient interpersonal agreement to suggest that it is the work, rather than the responder, that is described). Nor does it help to call artistic expressiveness metaphorical. Metaphors take many forms and serve many purposes, so the suggestion is no substitute for an analysis of the phenomenon; analyses of literary metaphor seem not to be readily generalized to painterly or musical expressiveness; and many words for emotions seem no more lively as metaphors when predicated of art works than does talk of the necks of bottles.

Here is one argument for the view that art works are expressive without giving expression to occurrent emotions. We experience resemblances between art works and humanly expressive behaviour (voices, faces, deportment, actions). We do not notice similarities and infer a connection. (This is false to the phenomenology of the experience and, anyway, explains neither the direction of the inference nor our failure to connect art to many other things it might be seen as resembling.) Instead, as Kivy would have it, we are 'wired' to animate our experiences if we can. We see cars with faces, dolphins with smiles and willows with gloomy demeanours. The similarity resides, as I said, in the *experiences* we have of human and artistic expressiveness; basic resemblances that might underpin this experience, those between elements of human expressive behaviour and features of art works, are located, if at all, after the fact. In art, this potential for resemblance is frequently modified and structured by conventions, so it will be apparent only to those familiar with the appropriate artistic practices.

Why, though, should this experience of resemblance justify the attribution of expressiveness to art, since we know the analogy cannot be carried through because works of art cannot embody occurrent experiences? Sometimes attributions of expressiveness concern the character of an appearance (of a body, or face) without regard to feelings. We might identify a person's bearing as sad without meaning that they feel sad, or entertaining that thought, or regarding them as prone to the feeling, but merely as a description of their deportment. (Obviously this secondary use of terms of emotion follows on the primary one in which we are interested in expressive appearances for the feelings they display or convey. The behaviour that betrays a feeling in one context is likely, in the absence of feeling, to produce an appearance with a corresponding expressive characteristic.) It is arguable that when we say, for example, that a musical piece is sad, our use concerns not occurrent emotions but emotional characteristics presented in the sound of the music as we experience it. Such appearances are more compelling in

art than in nature, where they also occur, because we know them to have been deliberately employed by the artist.

Such a view meets several of the desiderata of an account of the expressiveness attributed to art works themselves. It locates the expressiveness in the work, explains the immediacy and directness with which this is experienced, and connects ascriptions of expressiveness to art with, if not the primary uses of those terms in connection with occurrent emotions, then with secondary uses of a familiar kind. Moreover, it fortunately does not describe the audience's experience as involving conscious inference or fanciful imaginings, since these seem to be absent from the reactions of many.

7 The value of artistic expressiveness

Expressiveness in art is usually thought to be value-conferring. Sometimes its value is described as instrumental - art is a source of knowledge about and mastery of the emotions, and is the more useful for presenting or arousing these in contexts that lack 'life implications', thereby permitting us to contemplate and savour their natures. The value of artistic expressiveness is also intrinsic in that it contributes to and is an aspect of narrative, depictive, formal and sensuous elements that together provide an integrated entity, the appreciation and understanding of which is pleasurable. Art's expressiveness is an invitation to engagement; a person's recognition of and response to its expressiveness can be as revealing of their understanding as would be their dispassionate description of the piece. In its expressiveness, art might best be regarded not as a mirror of life, a lesson on it or a preparation for it, but as a celebration of its affective side.

Artistic forgery

Forgery in art occurs when something is presented as a work of art with a history it does not actually have. Typically this involves a false claim about the producer's identity. Forgeries are most usually works in the style of the artist whose work they falsely claim to be, while a forgery that is a copy of an existing work is a fake. Forgery is most common in the visual arts, but is also possible in other arts, such as literature and music.

The main aesthetic problem that forgery poses is that typically no deception is practised concerning what we might call the appearance of the forged object (generalizing from the pictorial case). Thus the forger does not deceive us about the disposition of colours on the canvas, the sequence of musical notes in the score, or the sequence of words in the text. If we adopt the widely held view that aesthetic value is a function of appearance alone, we shall conclude that something's being a forgery is irrelevant to its aesthetic worth; whatever false beliefs the viewer might be induced to have about the work, those beliefs could not affect an honest judgment of its aesthetic value. But in the art world it is universal practice to condemn forgery. If that practice is to be justified as anything other than artistic snobbery and the protection of prices in the art market, it must be shown that the aesthetic interest of a work is not exhausted by its appearance alone. In fact it can be shown that the aesthetic features of a work often depend on its historical features as well as on its appearance, and that these historical features are likely to be obscured by the deception that forgery involves.

1 Forgery and fakery

The most common type of artistic forgery is that of painting in the style of another, more valued artist; as, for example, when the failed Dutch artist van Meegeren painted and sold a series of 'Vermeers'. But forgery is possible in other arts, and poems, novels and musical works have had their origins intentionally misrepresented. Fakery also occurs, as when, for instance, a faked *Mona Lisa* was left in the Louvre to conceal the theft of the original. Fakery is less common than forgery, because the normally well-established facts of a painting's whereabouts make the deception involved in fakery hard to effect. The boundary between fakery and other kinds of forgery is hazy: Suppose A is a work, now lost, about whose appearance we have little information. I create B, without copying any work, and present it as A. Is B a fake of A, or merely an unfaked forgery? There are also works presented as the products of someone whose very identity is fabricated, such as the sixteen-poem oeuvre of the fictitious Ern Malley, composed as a trap for modernist enthusiasms by two poets in the Australian army.

Fakery and non-faked forgery, while different, pose questions for the aesthetician that can be given rather similar formulations. With a case of fakery (a case that is successful from the point of view of reproducing the given work's appearance) we ask, 'Is there an aesthetic difference between A, the original, and B, the fake, even though there is no difference in appearance between them?' In the case of non-faked forgery we ask, 'Is there a difference between A as it actually is, namely as something with a given appearance falsely purporting to be the work of X, and A as it might have been, namely as something with that same appearance but now genuinely the work of X?' In the case of fakery we are comparing objects within a single possible world; in the case of non-faked forgery we are comparing objects across possible worlds. In this brief survey we shall proceed informally, not making explicit this modal difference when arguing for the aesthetic relevance of forgery in general and fakery in particular. In this section we consider the varieties of forgery and fakery that are possible, and in the next section we shall tackle the aesthetic issue.

Forgery is possible in any art form, but Nelson Goodman (1981) has argued that fakery is not possible in music, literature and other 'allographic' arts, but only in 'autographic' arts such as painting and printmaking. (See Art works, ontology of §4 for critical discussion of this and other distinctions employed in this entry; here it is assumed that the autographic/allographic distinction divides the arts as Goodman claims, and that painting and printmaking are autographic while literature and music are allographic.) In autographic arts, a work's genuineness is a matter of its having the right history of production; in allographic arts it is not. Any sheaf of pages on which are inscribed the correct word sequence for *Northanger Abbey* is genuinely an instance of that work, irrespective of how, when or by whom it was produced. It is not possible to make a false claim that such a sheaf is genuine, because it is genuine. But it is possible to make a false claim that something which looks just like the authentic painting *Lucretia* byRembrandt is an instance (in fact the unique instance) of that work, or that something with the

appropriate appearance is an authentic instance of his etching *Tobit Blind*.

There is a difference between the painting case and the printmaking case. With painting, the unique instance of the work is identical to or constitutive of the work itself; with printmaking, where many authentic instances can be pulled from the same plate, no single instance, however authentic, is the work itself. So falsely presenting something as the painter's canvas amounts to falsely presenting something as the work itself; it is fakery of the work. Falsely presenting something as a print originating, in an authorized way, from the artist's block, amounts only to falsely presenting something as an instance of the work; it is not fakery of the work.

There is also a difference between autographic and allographic arts in the possibility of non-faked forgery: one can forge (but not fake) a work in the allographic arts without presenting anything that purports to be from the hand of the artist; this is not possible in the autographic arts. I might claim to be in possession of a poem by another hand, and produce as evidence for this a page of writing which I present as a mere copy of the alleged poet's autograph rather than as the autograph itself. This would be forgery. I can also falsely present something as a copy of a painting that is now lost. I could even present my copy as a perfect copy, and thus as a reliable guide to the appearance of that supposed work - how readily this would be believed is another matter. But it is doubtful whether this performance in the painting case constitutes forgery of any kind. Forgery is the activity of fraudulently claiming to present an instance of the work, and what counts as presenting an instance varies between the autographic and the allographic cases. In literature, an allographic art, any lexically correct copy of the original autograph is an instance of the work, and so the non-faking forger need claim only that what they present as an instance is lexically correct. For an autographic art form, the instances are just those with the requisite history, and the activity of presenting a copy not claimed to possess that history cannot count as presenting an instance of the work, and so cannot count as forgery.

2 The aesthetic significance of forgery

In this section we consider the potential impact that the discovery that an object is a forgery might have on our judgment of its merit as a work of art. It will not be argued that forgeries are automatically devoid of artistic worth, nor even that the fact of forgery is itself grounds for aesthetic reappraisal, though these claims have sometimes been made. It will be argued merely that the misrepresentation involved in a forgery is likely to have resulted in some other fact about the work being obscured, where the discovery of this other fact would justifiably lead to an aesthetic reappraisal.

The forger, in art and elsewhere, typically presents an object with a certain appearance, and hopes that we will make a plausible but erroneous inference from this appearance to certain other properties - its having been made by a certain person at a certain time and place, for example. If the aesthetic features of a work depend entirely on the appearance the forgery really has, and not on those inferred properties the forger hopes we will believe it has, forgery would have no aesthetic significance. Thus the visual appearance of van Meegeren's *Emmaus*, the word-sequence of the Malley poems, the ordering of musical notes in a Kreisler 'Mozart' piece, are evident features of these works. If they alone determine the aesthetic value of the work, the forger will not have practised any aesthetic deception. It seems we must say either that forgery is aesthetically irrelevant, or that the aesthetic qualities of the work depend on more than its evident features alone.

Someone unwilling to say either might appeal to an argument of Goodman's. Goodman claims that the best account we can give of the idea of two pictures looking exactly alike is one restricted to occasions of observation, that is, 'A and B are indistinguishable *for me now*'. So the fact that B is a forgery, though currently indistinguishable by me from A, may still be an aesthetically relevant fact for me now, because that fact will contribute to my future looking, and may result in my being able to see a difference between them. Even accepting Goodman's restriction of the notion of sameness of appearance, this argument is doubtful. To claim that the fact that one item is a forgery and the other is not constitutes an aesthetic difference because it *may* lead to the discovery of a difference of appearance seems to conflate possible and actual differences. If knowing that B is a forgery does lead me to notice a difference in appearance between A and B I may conclude that A and B differ aesthetically. If I do not find such a difference, then I have no reason to say that A and B differ aesthetically, whatever skills and knowledge I acquire in the process of examining them - so long, that is, as appearance is all that matters aesthetically.

If we are to establish the aesthetic significance of forgery we must abandon the idea that appearance alone determines a work's aesthetic value. A number of thought experiments have been suggested in which nonperceptible factors can be seen to make a difference to the value, *qua* works of art, of perceptually indistinguishable objects. To consider just the pictorial case: our judgment about this work's aesthetic success may crucially depend on whom we think it depicts. It may seem to capture the appearance and character of person X very successfully; when we learn that it is a picture of Y, our view may change. Its being a picture of Y rather than of X is not a feature of its appearance but of its history, and in particular of the history of its causal relations to X and to Y. Part of the impact of a work may consist in our recognition that it constitutes a strikingly original development of style or genre; a picture identical in appearance but produced much later would seem not original, but nostalgic or dull. Features of the work we would describe as elegant or delicate, which we thought had been produced by hand, would have little impact if we knew they were the product of a machine capable of producing lines of arbitrary thinness and complexity. There is little one can say about the appearance of an object that would be immune to these revisions based on a reassessment of the work's history. A description of the particular colours occurring at particular places on the surface might be the only claim immune to such revisions.

One response to the sorts of examples just cited is to say that they show simply that, when we judge a work according to representational, art-historical or technical criteria, we are not adopting a properly aesthetic standpoint. But it is unlikely that this narrowly aesthetic standpoint corresponds to the ways in which art works have traditionally been judged *qua* works of art, and its adoption would greatly impoverish our aesthetic discourse. The natural geometric partition of a picture, which we can describe in terms of abstract lines and planes, often depends on representational features, like the joined parts of a human body, that give salience to certain shapes. To ignore the representational features of the picture is to be no longer able to see what is natural about the geometric description. Apparently aesthetic predicates, such as 'is dynamic', when used for a painting, would not be aesthetic in this narrow sense; as Ernst Gombrich has emphasized (1977), a work like Mondrian's *Broadway Boogie-Woogie* can seem dynamic because works in the class to which it is naturally compared, namely Mondrian's other works, are rather static. Imagine *Broadway Boogie-Woogie* to have a different history, and it might be less appropriate to call it dynamic.

It is sometimes said that the upshot of our acquiring knowledge of the referential, art-historical and technical features of a work is that the object *looks different* to us from the way it had looked before we acquired that knowledge. And so, the objection goes, the examples described above are not really counterexamples to the thesis that there is no aesthetic difference without a difference of appearance. Rather, they are examples of the ways in which the work's appearance itself depends on extrinsic factors. If the objection were right, we should be able to answer the charge that forgery is aesthetically irrelevant immediately and without difficulty, saying simply that, since objects with different histories look different, there can be no objection to re-evaluating a work when we come to know that its history has been falsified, because that will change its appearance. However, the objection misses the point. To say that two objects are indistinguishable in appearance is not to say that how they look to the viewer is independent of the viewer's beliefs about their histories. A single object may look different to the viewer on two occasions of looking if they learn something about its history between the times of looking, but there is still a sense in which its appearance is unchanged. The sense in which objects can look the same despite differences between them in respect of facts about reference, history and technique is this: there could be a copy of the *Mona Lisa* so similar to the original that no one would be able to tell, on the basis of merely looking, whether the copy had been substituted for the original. The fact that, were the substitution pointed out, the copy would now look different to you from the way it had looked before (and different from the way the original had looked) is no objection to the claim that copy and original look exactly the same. It is in this sense of 'look the same' - being an indiscernible substitute for - that there can be an aesthetic difference between works that look the same.

We may conclude, then, that objects with the same appearance may yet have distinct aesthetic properties, and that therefore the aesthetic properties of the work are not fully determined by its appearance. In that case, the deception involved in forgery may result in the audience being misinformed about historical properties of the object potentially relevant to the determination of its aesthetic properties. Forgery is to that extent an aesthetically relevant fact.

Artistic interpretation

Interpretation aims to advance understanding by providing explanations of various kinds. In art, it should aim to maximize our understanding and appreciation of a work, and enable us to grasp its artistic values. When we interpret an art work we may explain why its elements are placed in their contexts, for example, to convey a certain meaning or express a certain feeling. In the case of literature we explain why words and passages are placed where they are, why characters and events are described as they are, and so on. When we interpret whole works, we explain how they fit into broader explanatory frameworks (for instance, Freudian or Marxist) or how they relate to various traditions so as to serve (or reject) the values emphasized in those traditions.

The distinction between description, or the presentation of the fundamental data constituting a work of art, and interpretation, which involves explaining why those elements exist in a work, what values they serve, may be used to justify claims that interpretations can never be known to be true, while descriptions are obviously true or false. While this is reinforced by the fact that a work may generate conflicting interpretations, the distinction does not imply that interpretations cannot be known to be correct.

In a related debate, many see the artist's intention in creating their work as the key to a valid interpretation. Since, however, many people find value in works in ways unintended by the artist, the onus is on the intentionalist to demonstrate the primacy of the value that the artist intended the work to have.

Ultimately, contending interpretations may not present as great a problem to a theory of interpretation as at first seems inevitable. Interpretations give priority in different ways to different artistic values; the choice of these values is simply a matter of artistic taste, not truth, and may not threaten the validity of any reasonably grounded interpretation.

1 Interpretation and description

Based on the fact that there is often more conflict among interpretations than among non-interpretive descriptions of works, many philosophers claim that interpretation is always on weaker epistemic ground than description. They claim that interpreters cannot know, or cannot know that they know, that their interpretations are correct. This epistemic weakness is supposed in itself to mark the distinction between interpretation and description of art works. But examples doom this attempt at distinguishing interpretation. Lady Macbeth can be known to be ambitious and manipulative, and this is an interpretation, albeit an obvious one, of her character. The distinction instead lies in the fact that interpretations are inferred, as explanations for what can be described without being interpreted. We non-interpretively describe what we directly perceive (as opposed to infer) in works; and such descriptions elicit universal agreement from audiences knowledgeable about the media in question, while interpretations need not elicit such agreement.

All artistic media present us with elements that can be described without being interpreted. Such elements constrain acceptable interpretations of the works that contain them, in that interpreters must explain why those elements exist as they do in the works. In painting and music the existence of such elements is obvious. Included among them are coloured shapes or notes and their formal relations. These make up the data or evidence for acceptable interpretations, which cannot be incompatible with their agreed descriptions. The counterparts in literature are not simply physical marks on paper, but words and sentences with their standard meanings. We do not perceive ink marks and infer that they are there to represent meaningful words. Instead, we directly perceive words and sentences, and, if we understand the language being used, agree on their standard meanings. Such elements make up texts, which should be defined in terms of standard lexical meanings at the times the texts are written. Even when we interpret such elements as metaphor or irony, we infer such interpretations as the best explanations for words with those standard or literal meanings being placed in those contexts. We make such inferences when doing so makes for more interesting readings or valuable literary experiences.

Some contemporary theorists of literary criticism deny that texts constrain acceptable interpretations. They see readers or critics as joining in the production of texts through their interpretive readings. To see pre-existing texts as constraints is, according to these theorists, to underestimate the degree of freedom that critics have in specifying their meanings and significance. Poetry is so notoriously open to radically different readings that it is empty to

claim that poetic texts, as opposed to critical communities, constrain what is acceptable as interpretation. But these theorists exaggerate. Even a poem such as William Blake's *The Tyger*, which is notorious for eliciting diverse interpretations, shows otherwise. For acceptable interpretations, no matter how divergent, must explain, for example, why Blake centrally used a term that ordinarily refers to tigers.

Others deny the distinction between description and interpretation by pointing out that what we take to be fictional facts in a work can depend on our interpretation of it. There are ghosts in *The Turn of the Screw* only if we interpret it as a ghost story. There is an egg in Piero della Francesca's Brera altarpiece only if we interpret a certain mysterious object in that way. But whenever interpretations are needed to determine what is (fictionally) true in a work, there remains a level of description of painted shapes or words used that cannot be placed in doubt. We may similarly grant that interpretations guide what we attend to or perceive in a work. The painted shapes to which we attend on a canvas will be those we take to contribute to the artistic value of the painting, and this will vary according to whether we interpret it as an allegory, a formal structure, and so on. But the shapes can nevertheless be described without being interpreted.

Finally, we may admit that the line between interpretation and description must sometimes be drawn finely, while maintaining that the distinction is crucial for understanding the constraints on acceptable interpretations. To point out, for example, that a musical passage leads back to the tonic key is to describe it non-interpretively, but to explain it simply as a bridge passage is to interpret it, however obviously.

2 Meaning

Most theorists of literary criticism agree that the interpretation of literature aims to disclose meanings in texts. They disagree about the ground of such meaning, whether it is simply the semantic conventions of the language, the intentions of authors, or the interpretive activities of readers or critics. But it should be clear that interpretation does not always consist in disclosing meanings (unless we think of meaning in the broad sense of significance, and of significance as the value of a work or the place of its parts in its broader structure); and disclosing meaning is not always interpreting. Trivially, in musical works and paintings there is not always semantic content to be revealed. In literature, if revelation of meaning were always interpretation, then every obvious paraphrase of every section of text would count as literary interpretation. But we need not interpret every simple sentence in a novel, and stating the ordinary dictionary meanings of the words in such sentences does not count as literary interpretation. As noted above, we simply grasp the meanings of such sentences as we read them, much as we see trees in a true-to-life landscape painting without having to interpret the painted shapes as trees.

One way of avoiding this objection is to view interpreting as determining the meaning of a whole text or a large segment of it from the lexical meanings of its words and sentences. But this view ignores the fact that phrases and even words in texts can be interpreted as well. Stating the meaning of some obscure phrase or line in a poem constitutes an interpretation when there is an implicit claim that the phrase is there to convey that meaning, and that its literary value lies at least partially in its doing so. Statements of meanings will rarely be complete interpretations of texts, since in literature the ways in which meanings are presented are relevant to the values of the works. Hence form and not merely content must be explained in complete interpretations. But certainly words often have value in a text largely because of the meanings they convey.

The idea that interpretation consists in determining the meaning of a whole text also implies that a simple paraphrase of a whole work is the paradigm interpretation of it. According to the explanatory account, it is most unlikely to be an interpretation at all. Simply to paraphrase a work is not normally to indicate the ways that its passages contribute to its overall artistic value. Conveying certain meanings is normally only part of that value, and paraphrase is needed to explain that part only when the text itself is ambiguous or obscure. Explanation of metaphorical, symbolic or ironic meaning is more often a part of genuine literary interpretation.

3 Intention

Much debate on this topic has centred on the relevance of artists' intentions. According to one side of this debate, if there is to be a standard of correct interpretation, it must lie in uncovering the intentions of artists regarding the meanings and expressive properties in their works, since otherwise these matters remain indeterminate and open to conflicting construals. According to this view, art is a form of communication, and the aim of the recipient, as in

all communication, is the discovery of the speaker's intentions. According to the other side, artists' intentions are inaccessible or irrelevant, since, if they are successfully realized, the results will be apparent in the works themselves; and if they are unsuccessful, they cannot determine how a work should be interpreted.

Viewing interpretation as value-enhancing explanation provides a different perspective on this issue. From this viewpoint there is certainly some value to be derived from seeing the world of an art work (and perhaps the real world as well) as its creator saw it and intended it to be seen. Seeing through another's eyes, or imagining through another's creative genius, so as to alter one's own imaginative vision, is a major benefit to be derived from the appreciation of art. This benefit requires fidelity to artists' intentions, where these are recoverable.

On the other side, to accept recoverable intentions as constraints on correct interpretations, to insist that there is always only one correct interpretation of any work of art and that this is the one intended by its artist, may be to rob contemporary audiences of valuable experiences they might have of the work. A Freudian reading of *Hamlet* may afford illuminating insights into its characters, whether or not such an interpretation was or could have been intended by Shakespeare. It is commonplace in the domain of music for conductors and performers not to be limited to conveying expressive properties specifically intended by composers. (It might be objected here that the performative interpretations of musicians do not fit the definition of interpretation given above, since they are not explanations. But they are informed by critical interpretations that are not constrained by composers' explicit intentions.)

The intentionalist can also be accused of confusing speakers' (artists') meanings, or what speakers intend to say, with utterance (text) meanings, or what their language conveys according to its semantic conventions. If an utterance or text is unclear or ambiguous, then a speaker's intentions cannot in themselves make it less so. In ordinary communicative contexts, we do not use speakers' intentions to clarify the meanings of their utterances; instead, we use the semantic conventions governing their utterances as guides to recovering their linguistic intentions.

Thus, the best argument for intentionalism - the claim that interpretation aims only to disclose artists' intentions - must be that art is a form of communication and, as such, shares this aim. This is partially correct in that, as indicated above, it points to one major value in the experience of art. But there are others. Since certain art works may be more interesting or expressive if not limited by their creators' specific intentions, the intentionalist must argue that the value indicated by the communicative model trumps all other values to be derived from the experience of art.

It should be noted finally here that we may ascribe intentions to artists on different levels of specificity. They may intend, for example, not only to convey specific meanings, but for their works to have certain dramatic or expressive effects, or, most broadly, for their works to be appreciated to the fullest extent possible. The realization of this broadest (and perhaps most common) intention may require creative acts of interpretation on the part of audiences. The problem with the orthodox intentionalist view is not (as some critics claim) that it forces us to search outside the work itself for its proper interpretation. We must in any case locate a work correctly in its broader artistic context and tradition to interpret and evaluate it correctly. The problem is rather that it focuses only on one sort of intention and one sort of value at the expense of others.

4 Incompatible interpretations

If acceptable interpretations guide perceptions or experiences of works towards enhanced appreciation of their values, and if art works have potential values that cannot be realized simultaneously in experiences of them, then incompatible interpretations might be equally acceptable. The second antecedent is true of many works and their parts. Iago's 'Credo' aria in Verdi's *Otello*, for example, can be interpreted as boisterously defiant or as broodingly sinister, and these different readings of the score and text will lead to different understandings of the character and his relations to other characters and to the dramatic events, and to different experiences of the work's expressive qualities. We cannot simply combine these interpretations by viewing the aria as ambiguous, since a reading or performance of it as ambiguous would differ from both these interpretations. It would be probably less satisfying, if more subtle, than either of the single interpretations, each of which could be equally satisfying or acceptable.

Interpretations are incompatible when they ascribe properties to a work (or its parts) that it cannot simultaneously

possess. They are acceptable when they produce understanding and experience of works that enhances the appreciation of central values in those works. Since great works of art are often multi-dimensional, it is rare that all their artistic values can be appreciated under single interpretations. When there are at least two incompatible but equally acceptable interpretations of a work, we cannot simply equate acceptability with truth. Inconsistent ascriptions cannot all be true, at least not absolutely. Talk of plausibility will not do here either, since plausibility must be defined in terms of probable truth. In such cases we can speak only of either acceptability or of truth relative to an acceptable interpretive scheme. When there is only one acceptable interpretation of some part of a work, we can continue to speak simply of truth.

That many works of art are intended to be susceptible to a variety of interpretations is indicated by their frequent use of metaphor and symbol, and by the incompleteness of their notations (especially in music). A theory of interpretation must explain why many apparent critical disagreements seem irresolvable. The theory presented above explains such disagreements as symptoms of incompatible but equally acceptable interpretations, and it explains the latter as resulting ultimately from differences in taste. If different interpretations enhance different artistic values by explaining elements within works as serving those values, then preference for one interpretation of a work over another will reflect a preference for particular kinds of experience that can be derived from the work. That is, it will reflect a particular taste in art.

Thus, interpretive disputes will mirror disagreements in evaluations of various works. Only realists or absolutists about the latter should be realists or absolutists about the former. Nevertheless, the acceptance of incompatible interpretations of the same works does not imply a lack of standards. Iago's aria may be interpreted in either of the irreconcilable ways mentioned above, but a reading or performance of it as light-heartedly humorous would be clearly inappropriate. An acceptable interpretation must adequately explain the work of art as it can be non-interpretively described.

Artistic style

Artistic style is a problematic notion in several ways. Sometimes the term refers to style in general, as it does in 'Good style requires good diction'. Sometimes it refers to style as a particular, as in 'Van Gogh's style' or 'the Baroque style'. In antiquity, style was a rhetorical concept referring to diction and syntax; consequently style is very often identified with the formal elements of a work of art as opposed to the content. However, the kind of subject matter an artist chooses may itself be a significant feature of style. One way of thinking about style is as a set of recurrent features of works of art that identify them as the product of a particular person, period or place. This may be adequate for some purposes, but it ignores the fact that a style has a unified 'physiognomy' or expressive character. The relation between style and expression is complex. A period style is often thought to express the cultural attitudes of the period, but it cannot do so in a very direct way. What a style expresses is a function of where it occurs in the history of style. Similarly, a work of art in an artist's individual style will be expressive only in the context of the possibilities of that style. According to the Romantic tradition, individual style is a genuine expression of the artist's self. But according to others, style is simply a construction by readers, viewers and listeners.

1 Historical background

The concept of style in the arts was first elaborated in Ancient Greek and Roman treatises on rhetoric - the art of public speaking. The ancients distinguished style from invention (subject matter) and organization (the arrangement of subject matter into parts). Style is diction, or word use, and composition, or the way in which words are combined into sentences. It is form rather than content: not what you say, but how you say it. Good style consists in correctness, clarity, ornamentation and decorum (appropriateness). However, since all good speech should be grammatically correct and clear, what chiefly makes the difference between one style and another is the use of ornamentation or rhetorical 'figures' and tropes. The principle of decorum stipulates that the style of a speech be appropriate to the total situation in which it is delivered, including who the speaker is, what they are talking about and what audience they are addressing. The ancients distinguished three kinds of style - plain, middle and grand - and each was appropriate to different occasions and purposes. It was very important to know how to adapt your style so as to secure the desired intellectual and emotional effect in your audience. Finally, style is sometimes thought of as an image of the speaker: Cicero's style to some extent reflects Cicero himself.

The rhetorical concept of style endured largely unaltered through the Enlightenment, and extended its area of application to music and the visual arts. The same 'subject', such as a portico or a representation of the Crucifixion, could be presented in different styles to achieve different effects. Different styles were individuated and organized into hierarchies. Decorum remained important: just as the epic poem demanded a more elevated style than the lyric, so in painting the grand style was suited to history painting as opposed to still life. Critics such as John Dryden took issue with Shakespeare because he mixed the grand style of tragedy with the low style of comedy in such works as *Hamlet* and *King Lear*, and the music theorist Johann Joseph Fux insisted that the styles of church music should not be confused with those of theatre and dance.

The advent of Romanticism and German Idealism radically altered the way in which style was conceived. The Romantics rejected the hierarchy of genres and the idea that a particular subject demanded a particular appropriate style. They argued that style and subject are not independent and that style cannot be defined in terms of a list of rhetorical ornaments. Coleridge, for example, celebrates the poem as a living, organic whole in which style and content are fused. To the Romantics a work of art was an emotional expression by an artist with a unique sensibility, whose emotional responses to a subject were embodied in both the style and content of their work. Individual style was the expression of all the peculiarities of the artist's qualities of mind and feeling.

On an altogether more grand scale, Hegel argued that different period styles are expressions of culture in general. For Hegel, art is a sensuous manifestation of Spirit, and the successive phases of art correspond to the inevitable movement of Spirit towards self-realization (see Hegel, G.W.F. §8). Each phase corresponds to a style - the Symbolic, the Classical and the Romantic (post-Classical or Christian) - and each is expressive of a different culture - the Ancient Egyptian, Ancient Greek and modern. Shorn of some of their metaphysical underpinnings, these ideas re-emerge in the theories of period style and style change developed by the great nineteenth-century

German art historians, Heinrich Wölfflin, Alois Riegl, Paul Frankl and others. For example, Wölfflin identified five contrasting style qualities - the most famous being ‘linear’ versus ‘painterly’ - through which he defined the contrast between the art of the High Renaissance and that of the Baroque period. He argued that there was a necessary evolution from the first set of qualities to the second, that this pattern of development recurred in most historical periods, and that it was due to principles internal to the history of art.

2 Style and form

The ancient rhetoricians discussed style in terms of rhetorical figures, both semantic (such as metaphor and personification) and syntactic (such as asyndeton and antithesis). Contemporary stylisticians and discourse analysts have used modern linguistic techniques to identify particular stylistic features of poems, plays and ordinary discourse. Style in this sense is identified as how something is said rather than what is said: with form rather than content. Very different things can be said in the same style, so style would appear to be independent of content. And the same content can be expressed in different styles: ‘The cat is on the mat’ is in plain style, in contrast to ‘The feline animal is situated upon the rug’, which is (inappropriately) in grand style, but they mean much the same thing. Style would therefore seem to involve choice of words and syntax - the ‘formal’ elements of the discourse rather than the content.

Are all formal elements part of style? Monroe Beardsley (Lang 1987) has tried to mark off stylistic from non-stylistic features of a discourse as those linguistic features which carry connotative or secondary meaning or which enable it to ‘reflect a subordinate illocutionary action’. So Caesar’s famous assertion, ‘Veni, vidi, vici’, primarily means that he came, he saw and he conquered, but in leaving out ‘and’ the utterance also implicitly asserts that Caesar operated quickly and decisively. The trouble is that any linguistic feature can have connotative or secondary meaning. Even when I say ‘The cat is on the mat’, I am implying that what I say is plain and straightforward. Indeed, any attempt to distinguish stylistic from non-stylistic linguistic features may well fail, since any word or grammatical construction in an appropriate context can contribute to style. The same is true of formal elements in the other arts, such as a particular sequence of chords or colours. The attempt to define a set of uniquely stylistic formal features seems to be hopeless.

3 Style and signature

In contemporary debates in aesthetics what is at issue is not normally style or stylistic features in general, but rather what is the nature of ‘a style’. Since a style is what picks out the work of a particular artist, period or place, perhaps a style can be thought of as the recurrent formal elements that identify a work as belonging to that artist, period or place.

The most important problem with the formalistic approach to style is that a style consists of more than just a set of formal elements. Styles have particular expressive qualities: they are plain, ornate, pompous, diffuse, sweet, euphonious, Miltonic, energetic, Latinate, abstract or flabby. Very often, subject matter is stylistically important: a penchant for subjects from Roman myth and legend together with fanciful Roman landscapes is arguably a feature of Poussin’s style, just as a tendency to domestic pastoral landscape is a feature of the Barbizon school style. A particular kind of iconography or conventional symbolism may also be important. Sometimes the use of certain materials - a preference for oil over watercolour or for bronze over marble - can be a feature of style, as can the use of certain techniques. In recognition of these multiple possibilities, Nelson Goodman has defined a style as ‘a complex characteristic that serves somewhat as an individual or group signature… in general stylistic properties help answer the questions: who? when? where?’ (1975).

The problem with this proposal is that not all identifying features are stylistic; the actual signature on a painting, for example, might not be part of the painter’s style. What, then, is distinctive about style regarded as signature? One answer is that it is only aesthetically salient qualities that count as stylistic. But on the one hand, some aspects of a work of art, such as its size and subject matter, are always aesthetically salient whether or not they are part of style; on the other hand, style features are not always particularly salient: often only a very careful study will unearth them.

One of the important facts about a style is that it comes across as an expressive unity. A set of recurrent features is not a style unless the features themselves combine to form a certain ‘physiognomy’: the style is pompous or

sentimental or Ciceronian. Hence style qualities do not just identify an artist, school or period; they also contribute to the expression of a particular ‘character’. One plausible suggestion, therefore, is to count as stylistic all those features of subject matter, form, expression, symbolism, materials and so on. which contribute towards the expression of the overall character of the individual or period in question.

4 Style and expression

The Hegelian idea that a period style expresses the collective spirit of an epoch or country and that the style of a particular work of art is a symptom of that spirit has been roundly criticized by twentieth-century art historians. Meyer Schapiro (1994) has urged that we should not extrapolate from a single painting to cultural attitudes in general: one-to-one correlations usually hold only between single aspects of a painting and the culture from which it originates. Erwin Panofsky (1955) has shown how we cannot tell what general attitudes are expressed by a painting unless we can place the picture in the history of style and the history of iconography. We can interpret what Tintoretto’s *Last Supper* expresses only if we know the history of renderings of the Last Supper. The picture has to be seen as a response to and a rejection of previous *Last Supper*s, such asGiotto’s and Leonardo’s. Ernst Gombrich (1960) has made a similar point with respect to works within a painter’s individual style: what a painting expresses is a function of its place within the artist’s ‘language’ or repertoire. Van Gogh’s painting of his room at Arles is relatively serene in the context of Van Gogh’s oeuvre, whereas if it were (*per impossibile*) by Cézanne it would express much greater turbulence and distress.

Deterministic theories of style change have also been criticized. All such theories treat style as inevitably moving towards some goal, but artists cannot be striving to achieve a perfection that has not yet come about and of which they cannot be cognizant. Style change is the result of individual artists responding to many influences, including the challenges posed by the art of the past, and should be thought of, says James Ackerman, not as ‘a succession of steps towards a solution to a given problem, but as a succession of steps away from one or more original statements of a problem’ (1963). Nevertheless, certain patterns of development do recur in the history of art, for example in the development of sculpture in Ancient Greece and the Renaissance. Ackerman suggests that this is due to a similarity in the way that the problems facing sculptors were conceived, as well as a similarity in the solutions they found. Thus both ancient and Renaissance sculptors were struggling with the same problem of how to create beautiful human forms out of blocks of stone, and there is the same development from a ‘blocky’ archaic style to the ideal Classical solution, and from that to the development of a freer, more dynamic style.

If style change and the expressiveness of style can only be understood as the result of individual artists responding to the art of the past and implicitly either accepting or rejecting specific alternatives, then it might seem as if style entails choice: in developing a style an artist chooses one particular form of words or configuration of lines in preference to others, depending upon what they want to express. Leonard Meyer, for example, defines style in music as a ‘replication of patterning… that results from a series of choices made within some set of constraints’ (1989). For example, given the constraints on the style of the classical sonata, Beethoven’s decision to begin his piano sonata, ‘Les Adieux’, with a deceptive cadence is an unexpected stylistic choice that permits the opening phrase to express an uncertain, plaintive quality. On the other hand, the word ‘choice’ may be misleading if it implies deliberation and conscious decision-making.

5 Style and personality

Most of the theories of style discussed so far have considered style from the historian’s point of view. It is, for example, a third-person viewpoint which treats Beethoven as working within certain constraints and as making certain choices. A different approach has been taken by Richard Wollheim (Lang 1987), who argues that there is an important theoretical distinction between the individual style of a particular artist and such general style categories as school style (the style of the school of Giotto), period style (Baroque concerto-grosso style, Augustan poetic style) and universal style (the geometric style, the heroic-epic style). General style categories are the invention of historians, who try to organize a body of knowledge according to their own interests and purposes. By contrast, an artist’s individual style has ‘psychological reality’ and can be captured only by a ‘generative’ conception of style that picks out and groups together elements of the artist’s work which are ‘dependent upon processes or operations’ characteristic of the artist’s acting as an artist. Wollheim restricts his theory to pictorial style, since he is thinking of style processes not only as psychologically dependent on the artist but also as physically embodied in motor habits and motor memory. However, the theory can be generalized to the other arts

if style is thought of as a way of doing or making something which is expressive of the artist's character, qualities of mind, attitudes and sensibility.

This way of thinking about style is reflected in Arthur Danto's maxim that style is 'what is done without art or knowledge' (1981). On this view, artists, in developing their individual styles, do not literally 'choose' among alternatives. Being of a certain character, the artist is able to paint or write only in accordance with that character. By the same token, a forgery of a painting, even one that cannot be distinguished from the original, cannot have style. It is a deliberate imitation of an already existent work or style, whereas the original is a genuine expression of the artist's self. For the same reason a forgery has no genuine aesthetic significance, for having a formed style is a precondition of expressiveness and hence of aesthetic interest (see Artistic forgery).

The theory that style is a way of doing something that expresses the artist's unique personality, character and ways of thinking and feeling explains many of the puzzles surrounding the concept of style. It explains why not all formal features of a work or oeuvre are stylistic, why subject matter can but need not be a feature of style, and why a feature can be a stylistic feature in one work or oeuvre and not in another: in every case it depends on whether the feature is expressive of the artist's character or personality. Similarly, the theory explains the unity of style in terms of the unity of the personality expressed and it explains the difference between style and signature: a recurrent feature of an artist's oeuvre is not stylistic unless it contributes to the expression of the artist's character. Thus a literal signature is not usually a feature of style.

However, the theory is unattractive to those who think of style as irremediably conventional, as the result of operations performed by readers. Some writers have argued that style is a function of the operations performed by the 'implied author' of the work, as constructed by the reader or viewer. Michel Foucault takes a more extreme position (1979). He argues that the notion of a unified style is simply one of the principles that identify the 'author-function' of a work, this function being characteristic of works which have a certain status and are designed to be received in a certain way. On this view style has no reality at all; it is just a social construction.

Artistic taste

Taste has been variously understood as (1) the capacity to take pleasure in certain artistic and natural objects, (2) the capacity to identify the constituent elements in such objects, and (3) the capacity to discern certain special properties. Taste in sense (1) has been a topic since the early eighteenth century, culminating in the work of Hume and Kant. This conception of taste is annexed to the idea that 'beauty' or 'artistic excellence' is not itself an objective property of things, but that it is recorded in judgments of beauty as a report of a certain kind of pleasure felt by the judge in the presence of these things. Taste in sense (2), which is an analogue of the notion of taste as the ability to discriminate with the tongue and taste buds, has also been a topic since the eighteenth century, articulated perhaps most clearly by Hume. A connection between sense (1) and sense (2) is intended by eighteenth-century authors, but the connection has not been formulated clearly. Taste in sense (3) is a conception originating in the mid-twentieth century, notably in the work of Frank Sibley. It is primarily the idea that beauty, elegance, gracefulness and other properties - collectively called 'aesthetic properties' - require a special capacity for their discernment, although these are truly objective properties located in the objects being judged.

1 Hume

The idea of taste was given a central position in the philosophy of art in the eighteenth century, and though, afterKant, it ceased to be an especially lively topic, it has returned in the twentieth century and continues to receive considerable attention.

For more than two centuries taste has been thought of, roughly, as the human capacity to respond to beauty, and in early theories - David Hume's, in particular - the capacity to elicit certain responses of taste was taken to be the mark of beauty. Thus Hume understands the 'standard of taste and beauty' to be located in judges of particularly qualified taste.

In the eighteenth century, taste is characterized in two ways, whose relation is not obvious. (1) Taste is thought of as the capacity to respond with affirmative and negative feelings to items of beauty and ugliness. (2) Taste is thought of as the ability to discriminate the elements present in some item. The term 'discriminating', as in the expression 'a person of discriminating taste', tends to meld senses (1) and (2), sometimes without regard to an apparent logical difference between them. In one sense, a person of taste is said to be someone whose personal preferences attach to objects of merit: the person is someone who likes good things and dislikes poor things. In the other sense, a person of taste is said to be someone who can distinguish and identify the objects they deal with. People with taste in wine, for instance, are thought of both as people who truly enjoy better wines and are put off by poor wines, and as people who can identify and describe the qualities of any wine they happen to taste, and can, perhaps, identify the vintage. Both these senses of 'taste' are present in Hume's texts:

> There is a *delicacy* of *taste* observable in some men, which very much resembles this *delicacy* of *passion*, and produces the same sensibility to beauty and deformity of every kind, as that does to prosperity and adversity, obligations and injuries.
>
> (1741: 4)

> Where the organs are so fine, as to allow nothing to escape them; and at the same time so exact as to perceive every ingredient in the composition: This we call delicacy of taste, whether we employ these terms in the literal or metaphorical sense.
>
> (1757: 235)

When taste is thought of as a basis for normative judgments of beauty or artistic excellence, then the two senses of taste can be set in a kind of pragmatic relation. The determination of the aesthetic quality of something (its beauty, ugliness, artistic excellence, artistic failure, and so on.) is formulated in terms of how someone of adequate taste feels about the thing. The determination that this judge has adequate taste is in turn formulated in terms of the judge's ability to distinguish the components of the thing. This relation threatens to be circular unless either the merit of the thing or the qualifications of the judge can be independently established. Because those interested in the idea of taste have customarily hoped to define beauty in terms of the responses of judges of taste, their best recourse seems to be an attempt to show that the qualifications of the judge can be established independently of all

considerations of beauty. Thus Hume says:

> But if we consider the matter aright, these [questions of whether someone has adequate taste] are questions of fact, not of sentiment. Whether any particular person be endowed with good sense and a delicate imagination, free from prejudice, may often be the subject of dispute, and be liable to great discussion and enquiry…. Where these doubts occur, men can do no more than in other disputable questions, which are submitted to the understanding: They must produce the best arguments, that their invention suggests to them; they must acknowledge a true and decisive standard to exist somewhere, to wit, real existence and matter of fact…. It is sufficient for our present purpose, if we have proved, that the taste of all individuals is not upon an equal footing.
>
> (1757: 242)

This suggests a thesis that, in general, holds an object to be beautiful because it elicits pleasure in someone possessing the requisite capacity to respond, and it takes this requisite capacity to be identifiable in a person through the use of empirical, verifiable tests. Beauty is essentially a matter of human response, and is in this sense subjective, but since it is possible to authenticate the legitimacy of responses, the possession of taste is in this sense an objective fact; the attribution of beauty is thus a matter for empirical investigation (see Hume, D.).

2 Kant

Kant denies this possibility. He agrees that beauty is experienced essentially and solely in the exercise of taste, but denies that there is any empirical test that might determine whether taste is being properly exercised. ThusKant supposes that someone making what they take to be 'a pure judgment of taste' is justified in supposing that the object being judged is indeed beautiful, but that neither they nor anyone else can in principle *prove* that the judgment is correct. Despite his insistence that the judgment of taste is not an objective judgment, Kant argues that it is a unique and essential illustration of the general human capacity to make judgments of any kind, including those which are not 'aesthetical' and hence 'subjective', but are genuinely what Kant calls 'logical', 'objective' judgments.

One peculiarity of Kant's work is that he initially develops his theory of taste exclusively in terms of objects of nature. Later he turns to the consideration of the exercise of taste in judgments of works of art, developing an elaborate theory of such judgments, but declaring that judgments of beauty made about works of art are inevitably 'impure', because the judge is implicitly aware that the the object was *made*. Kant's argument for the impurity of such judgments is elliptical. It turns on his conviction that a pure judgment of taste does not involve the application of a predicate concept, while the recognition that an object was made involves a recognition that some concept was instrumental in the making of the object, this concept then inevitably figuring in one's taste-judgment of the object (see Kant, I. §12).

3 Sibley

In the mid-twentieth century the idea of taste was reconceived, notably in the work of Frank Sibley and the many commentators on his work. Whereas eighteenth-century theorists conceived taste either as the capacity to feel pleasure in the presence of certain objects or as the capacity to discern the properties of objects,Sibley conceives it as the ability to detect various special properties he calls 'aesthetic properties'. Although it is not clear whether these properties are distinguished by requiring taste for their perception, or whether taste itself is understood as the ability to perceive them,Sibley gives them an uncircular, working characterization by enumerating some of them: they are the properties named by 'graceful', 'elegant' and 'delicate', for instance, and he calls these words 'aesthetic terms'. He is content to identify aesthetic terms, in general, as terms similar to those that he enumerates. Taste thus becomes the ability to apply aesthetic terms, presumably by virtue of one's possession of the associated 'aesthetic concepts'. He also characterizes the exercise of taste independently of any considerations of feeling. Sibley's conception of taste is thus similar to the eighteenth-century idea of taste as an ability to detect properties, but unlike eighteenth-century authors, he regards the relevant properties as members of a special class, and again, unlike those authors, he does not treat the capacity for feeling as an essential aspect of the exercise of taste, while not denying that feelings might be attendant upon the exercise of taste. The success of Sibley's conception is a matter of current debate. Two questions deserve particular attention: (1) Can the ideas of taste and aesthetic properties be characterized independently of each other, or at least characterized in a manner that is not viciously

circular? (2) Is there an adequate criterion for distinguishing aesthetic properties from non-aesthetic properties?

4 Further issues

It may be thought that the only point of interest in the topic of taste arises from an epistemological conviction that judgments in aesthetics must be grounded in feelings, and, therefore, that the status of these feelings is implicated in any possibility of the objectivity of aesthetic judgments. This is not so. The question of one's personal taste retains philosophical interest even if there is an objective, independent standard of beauty, or if there can be no standard even in terms of taste.

In the first case, we imagine that there is some impersonal, objective measure of beauty. We will then think of a person of good taste as someone who has positive feelings about objects of merit (and, perhaps, negative feelings about meritless things). The question arises, should one like the objects of merit and dislike the inferior ones? What kind of obligation is this? Contemporary moral theorists have tended to separate questions of normative assessments of actions from questions of motivation. That is, the question of which action should be carried out is kept independent of the question of whether an agent is moved to do that action. One might think of a morally perfect person - a saint, for example - as someone who is always moved to do, and feels like doing the right thing. Analogously, one might think of an aesthetically perfect person as someone who always likes beautiful things, and only likes beautiful things. The relation of moral judgment to moral motivation is far from clear, but there is no doubt that a remark like this is sensible: 'I knew that it was the right thing to do, but I could not bring myself to do it.' Is there a parallel in the aesthetic case? In other words, is it sensible to say, 'I know that it is a beautiful thing, but I cannot bring myself to care for it'?

If a person making judgments about beauty distinguishes between judging something to be beautiful and merely having a positive feeling for the object, then in what way, if any, are such judgments and feelings related? Could one have positive feelings without being inclined to judge the object beautiful? Could one judge the object beautiful in the absence of any positive feelings of one's own? An explanation of the relation between feeling and judgment - in a single person - seems to be required, even if individual feeling were not a factor in the formulation of a standard of beauty.

In the second case, we imagine that there is no objective measure of beauty, that people making such judgments are only expressing their own feelings and preferences. It may still be wondered whether individual people, exercising their taste in expressions of liking, disliking and preferences, display self-consistency. If these people like something, say, a work of art, and believe that they like it on account of some property the work possesses, then what if they fail to like some other work that possesses the same property? Besides this question of an individual's aesthetic consistency, there is also a question of how to understand the totality of one's taste. It is, after all, the same person that likes one thing, dislikes another, prefers one thing to another, and so on. Since these exercises of taste exhibit and define a person's aesthetical self, it is necessary to ask how one would characterize the 'logic' of that self.

However taste is conceived, and however we are to understand its constitution and expression in a single person, there remains this question: is it better to have good taste? Why? Because it leads one to a life of greater pleasure? Surely that is but a hope, contingent on the objects one might encounter, and threatened by the fact that pleasures of taste are only some of the pleasures available to a person - they might be outweighed by other pleasures, the pursuit of which is blocked by the development and exercise of one's taste. Perhaps the possession of good or delicate taste makes for an improvement in one's well-being, and is necessary for enjoying a better life; it remains to explain why.

Artist’s intention

W.K. Wimsatt and Monroe C. Beardsley’s famous paper ‘The Intentional Fallacy’ *(1946) began one of the central debates in aesthetics and literary theory of the last half-century. By describing as a fallacy the belief that critics should take into account the author’s intentions when interpreting or evaluating a piece of literature, they were rejecting an entrenched assumption of traditional criticism - and a natural one, since we normally take it for granted that understanding actions, including acts of speech and writing, requires a grasp of the intentions of the agent. But they were expressing an idea that has been greatly influential; it was a central claim of the ‘new criticism’, while the marginalization of the author is also a marked feature of structuralist and poststructuralist literary theory. Most of the debate over the artist’s intentions - ‘artist’ here being used as a general word for writer, composer, painter, and so on - has centred on their relevance for* interpreting *art works. More particularly, the question has been whether* external *evidence about the artist’s intentions - evidence not presented by the work itself - is relevant to determining the work’s meaning.*

1 Some arguments against the relevance of intention

(1) Wimsatt and Beardsley (1946) argue that the intention of the author is not available to the interpreter of a literary work. More recently, Jacques Derrida has claimed that writing remains essentially readable even when its original context is forgotten, inviting the conclusion that writing is able to fulfil its function without the reader needing to consider the intentions of the writer. In partial support of these claims, it seems reasonable to say, at least, that for many art works (those of Homer, say) we know little about any of the day-to-day thoughts their authors had about them at the time of their composition. Since this seems to present no serious impediment to the process of interpretation and criticism, some theorists conclude that questions of intention are irrelevant to interpretation.

(2) It seems uncontentious that the critic’s basic task is to interpret and assess the work, for its own sake and not as a means of discovering something about the author. That the author had a certain intention is a fact about the author, not the work, and an intention with regard to the work is merely a seed in the author’s mind, until the intention is carried out. If it is successfully carried out, sayWimsatt and Beardsley, the feature is now visible in the work and it is not necessary to consider the author’s intentions, and if not, the feature has not been realized in the work, and so any concern with it is irrelevant to criticism.

(3) It is generally agreed that a work may have ‘personal’ features: it may be cheerful, sentimental, ironic, patriotic. However, Wimsatt and Beardsley say that the work is merely a dramatized response of an implied speaker to some situation. They rightly point out that there is no reason to identify the narrative voice with that of the author, but also suggest, more contentiously, that the tone of the work or any pervasive attitude to be found in it - cheerfulness, irony - are to be imputed to a purely literary or imaginary figure conjured up by the work and, if to the author at all, only by an act of biographical inference. Such an inference, by which we might try to pin down the author’s intentions, would take critics beyond the task of criticism; as critics, their concern is solely with the attitudes portrayed in the work.

(4) Few would dispute that, without generally observed rules of grammar and usage, no particular use of language could be understood. Certainly, the work of an author who uses a private code of ‘intended meanings’ would be entirely opaque. But literature is accessible. Beardsley and Wimsatt conclude that (with the exception of certain ‘private and semi-private’ meanings that may have become part of a word’s history) it is the public rules of syntax and semantics that determine a work’s meaning, and not the intentions of the author. A similar argument has been used by structuralists, for whom meaning depends on the system of ‘differences’ established by words in relation to one another, and on ‘codes’ governing their usage. It is held that a necessary and sufficient condition of interpretation is a knowledge of the system of inter-related words and the application of the codes, and that the author’s intentions are therefore irrelevant.

2 Privacy and the mind

Argument (1) needs to be assessed in the context of recent developments in the philosophy of mind, and especially of the way these have helped advance the debate on other minds. In at least some versions, the argument appears to

presuppose a dualistic conception of the mind by suggesting that a difficulty with intention-based criticism is that it could only work in those cases where authors have left detailed accounts of their intentions regarding their writing. But a widely preferred alternative to dualism - which we shall call the 'explanation' view - holds that we do not form our impressions of the mental states of others solely on the basis of their own reports, but according to the evidence of what they do more generally. We assume that their intentional activities are carried out in accordance with their beliefs and desires, and, starting from our available knowledge of their character and projects, construe those activities in the light of whatever motivational states best explain them. On this view any of their activities can reveal their intentions. Once it is accepted that, in general, someone's mental states show through in what they do, the question arises of why there should be any special difficulty about determining writers' intentions given the evidence of their writing itself. Those wishing to defend argument (1) have to show that the compositional activities of writers lack the evidential character of behaviour in general. They must establish this against the plausible claim that, among the various products of human effort, works of art are, if anything, unusually rich with the signs of their maker's cogitations and interests and so provide a wealth of evidence of the artist's intentions. (This reply to argument (1) can concede for the purpose of argument that no external evidence is available, though it is worth noting that even in the most challenging cases we are more than likely to have some general information about the historical and social circumstances of the artist, while more usually we also have a fair amount of biographical information.)

Opponents of intention-based criticism often point out that critics seldom feel bound by an artist's *avowals* of intention, and override them when they fail to make the best sense of what we find in the work. But this, while true, does not show that intentions are irrelevant to criticism. Proponents of the explanation view will want to point out that one kind of evidence for the presence of an intention can be overridden by another. Depending on the merits of the case, the artist's avowals (and other forms of external evidence) can sometimes be ignored in favour of indications of intention suggested by the configuration in the work itself.

3 Art and experience

Argument (2) rightly assumes that the critic's task is to understand the work itself, and that for a claim about the artist (for example, one concerning the artist's intentions) to be relevant to criticism, the claim must potentially make a difference to the way we experience the work. But this only tells us that the critic's interest in the artist should be for the sake of understanding the work and not vice versa. (An analogy: to inquire whether someone's hand gesture was intended as a greeting, not an insult, is in a sense to look past the gesture to the agent; but the answer would also help the inquirer to see the gesture itself more clearly.)

Argument (2) also seems to assume that a realized intention will automatically make its presence felt in the work, whereas an unrealized one can have no bearing on the experience of the work. These assumptions are called into question by a commonplace of the philosophy of perception, namely, that the way we experience an object is in part a product of our mental orientation towards it. In that case, even if an intention is realized we may sometimes not see that the work is the outcome of that intention unless alerted to the fact by external evidence. And if it is not realized, external evidence about the unrealized intention could conceivably modify and enrich the way the work is experienced. It is worth noting, finally, that the very idea of a straightforward distinction between internal and external evidence is called into question once it is conceded that what is visible in a work is modified by what is known about it.

Turning to argument (3), it must be conceded in its favour that in calling a piece of fiction or a poem cheerful we are not usually saying or implying that the writer felt cheerful at the time of writing it. But in the case of some personal qualities, the presence of the quality in the writing does seem to depend on whether the writer wrote the piece in an appropriate state of mind. Nor does it always seem possible to reconstrue the apparent viewpoint of the writer as a merely notional viewpoint within the work. Perhaps the underlying principle of argument (3) is that in aesthetic matters what counts is whether the work presents an *impression* of a certain attitude, while it is irrelevant whether that happens to coincide with what the artist felt. One difficulty with this is that the impression is likely to vary with what we take the underlying attitude of the artist to have been. A defender of the principle might now say that in that case the work is ambiguous, and that we should always apply the most charitable reading, again disregarding what the artist's actual attitude might have been. But this may be simplistic. Suppose that according to the charitable reading a poem expresses sympathy for the victims of a war, but that external evidence shows that

rather than (a) expressing an actually felt sympathy, the poet had (b) perfectly contrived the mere impression of sympathy in order cynically to exploit a general climate of concern for the victims. Someone tempted by the 'impression' principle should carefully consider whether it really is critically irrelevant that we have a case of (a) or (b). Another difficulty with the 'impression' principle is that some of the features we ascribe to writing cannot *but* be features of the writer. We cannot ascribe virtues like intelligence, perceptiveness or wit to a piece of writing without being prepared to ascribe these to the writer. And similarly, it is hard to avoid the implication that, when we attribute certain shortcomings to writing - pretentiousness, sentimentality, narcissism - we are implicitly criticizing the writer.

4 Meaning and use

Argument (4) turns on the claim that literary works are composed in a public medium. Certainly, poets and novelists do not choose the meanings they give to words but work within the constraints of general usage. But defenders of (4) need more than this to make their case. They need to establish that a knowledge of syntax, semantics and general usage is not merely necessary but also *sufficient* for interpretation. Counting against this is a commonplace of linguistic theory, namely, that when a sentence is encountered in isolation, the semantics and syntax of the language will enable native speakers to grasp only its propositional content, and that until the particular circumstances of its use have shown the user's specific intentions, it has been understood only in an attenuated sense. But perhaps a defender of (4) will argue that *literary* interpretation is not concerned with those aspects of meaning which are associated with intention. This, however, seems implausible, because it threatens to exclude tonal features of writing like irony and sarcasm, as well as the import of metaphors, allusions and the like, all of which depend on the intentions with which words are used. Alternatively, the claim might be that a work of art can be said to have whatever features of meaning most enhance the resulting aesthetic impression, provided that, given its syntactic and semantic character, the work can plausibly be seen or imagined *as* the outcome of intentions associated with that meaning. But this is also an extreme claim. Consider a painting that is a portrait of A. You could treat it as though it were intended as a portrait of B (the effect could be as satisfying as you like) but this would not make it a portrait of B. Returning to literature, a well-known problem case is Blake's use of the phrase 'dark satanic mills' in his poem *Jerusalem*. The phrase has often been interpreted as a reference to the factories of the Industrial Revolution, but it is now commonly accepted that this reading is historically impossible. Suppose, then, that Blake was not indeed referring to factories, but that the impossible reading is, none the less, more satisfying than more plausible ones. One reason for ruling it out, despite its appeal, would be that it is not, strictly speaking, an interpretation ofBlake's poem, since we know that Blake's poem does not refer to factories. Someone might attempt to legitimate the unintended but supposedly more attractive reading of the poem by saying that it is a valid critical activity to view a poem simply as a timeless verbal configuration, ignoring constitutive features it acquired through the context in which it was written. However, there appears to be only a difference of degree between a case like this and, say, the case of a free adaptation of *Macbeth* which transposes the play into a present day political setting with familiar contemporary politicians in leading roles - surely a case of a new play created out of the old. We may still call this an 'interpretation' of *Macbeth*, but then we are talking about a special activity, whose existence, however welcome, is no threat or rival to interpretation as exegesis.

Arya Samaj

*The Arya Samaj (*ārya-samāj*, 'The Association of Nobles') is a Hindu reform movement founded in 1875 by Swami Dayanand Saraswati (1824-83). Based on the supposition that the true religion of India was put forth in the ancient Vedas, rather than in later epics and cycles of myths, the principal aim of the Arya Samaj is to purge modern Hinduism of beliefs and practices associated with the devotional and mythic literature of India. Condemning the hereditary caste system and dismissing the practice of using icons and idols in worship, the society favoured a more rationalistic, humanistic and nationalistic form of Hinduism as India entered the modern era.*

The Arya Samaj, a prominent Hindu reform movement, was founded in the nineteenth century by Swami Dayanand Saraswati. Also known as Mul Shankar and nicknamed 'the Luther of India', Dayanand was born in 1824 into a Brahmanical family of Gujarat. As a boy he always doubted the divinity of idols of Hindu gods. The death of his sister turned him to pondering the problems of life and death. Consequently, he ran away from home and wandered for many years in search of a guru. At last in Mathura he found a blind teacher named Swami Brijanand, who taught him the philosophical interpretations of the Vedas, the most ancient collection of sacred writings in India.

Through his study of the Vedas, Swami Dayanand became convinced that selfish and ignorant priests had pervaded the Hindu religion during the post-Vedic period. Part of the reason for this corruption, he believed, were the Purāṇas, the eighteen collections of myths and legends of gods and heroes that form the basis of most devotional forms of Hinduism in the medieval and modern periods. These texts, which had informally acquired the status of sacred scripture and the contents of which had become much more familiar to most Hindus than the Vedas, were, Dayanand believed, full of false teachings. Linking priestly corruption with these (for him, apocryphal) Purāṇas, and seeing both priestly and textual corruption as the source of contemporary social problems, Dayanand began in 1863 to preach his doctrines publicly. Twelve years later, in 1875, he established the Arya Samaj (*ārya-samāj*, 'The Association of Nobles') in Bombay.

Dayanand regarded the Vedas as eternal and infallible and laid down his own interpretations of them in a book entitled *Satyārth Prakāś*. He considered the Vedas to be the inspired word of God and the fount of all knowledge. He rejected all later religious thought on the grounds of its conflict with the Vedas. Thus, unlike most traditional Hindu thinkers, Dayanand repudiated the authority of the post-Vedic texts, such as the Purāṇas, and regarded the epics, the *Rāmāyaṇa* and the *Mahābhārata*, as literary treasures and nothing more. His total dependence on the Vedas and their infallibility gives his teachings an orthodox colouring, for in orthodox Hindu thought, scriptural infallibility means that human reason is subordinate to sacred texts. Despite this appearance of orthodoxy, Dayanand's approach in fact has rationalistic and humanistic leanings, because the Vedas, though revealed, are to be interpreted by himself and other human beings. Thus, in the final analysis, Dayanand insisted that individual reason is the deciding factor in arriving at religious knowledge.

In keeping with his rejection of the mythology of the Purāṇas, Dayanand condemned the idolatry associated with their mythology. He also rejected the hereditary system of caste, giving it instead an ethical and occupational interpretation, somewhat as the Buddha had done. He questioned the authority and social superiority of Brahmans, and was against animal sacrifices and long pilgrimages. A confirmed nationalist, Dayanand believed that 'Aryans were the chosen people, the Vedas the chosen gospel and India the chosen land'. So the Arya Samaj looked upon the Vedas as India's 'rock of ages' and coined the slogan 'go back to the Vedas'.

The Arya Samaj, like the Brahmo Samaj, worked courageously to eliminate the social evils that it believed had crept into Hindu society. It was more a social reform movement than a strictly religious or philosophical school. In the area of social reform, the Arya Samaj struggled against child marriage and campaigned to fix the minimum age of marriage for boys and girls at 25 and 16 respectively. It advocated a status for women equal to that of men. Intercaste marriage was encouraged, as was the remarriage of widows. In addition to advocating progressive reforms, the Arya Samaj undertook charitable works during national disasters such as earthquakes, famines and floods, and it opened orphanages and homes for widows, thereby giving a new lease of life to the distressed.

The leaders of the Arya Samaj were aware of the supreme importance of education, but sharp differences arose within the movement over the question of the best system. One faction favoured the ancient system of Hindu education. One of its leaders, Swami Shardhanand, started the ‘Gurukul’ near Haridwar in 1902 to propagate the more traditional ideas. Another faction recognized the value of British education and established a network of ‘Dayanand Anglo-Vedic Schools and Colleges’ for both boys and girls throughout the country. Lala Hansraj played a leading part in this effort.

In order to counter Christian and Muslim missionary activities, the Arya Samaj started the *śuddhi* (purity) movement for the reconversion of those Hindus who had been unwillingly or forcibly converted to Islam or Christianity. They could now be readmitted to Hinduism after passing through a ceremony of purification. While the Arya Samaj’s work in social reforms tended to unite people, its religious work tended, though perhaps unconsciously, to work against the growing sense of national unity arising among the Hindus, Muslims, Parsis, Sikhs and Christians of India.

Though founded in Bombay, the Arya Samaj found its true home in Punjab, and it later spread far and wide over the whole of northern India. After Dayanand’s death in 1883, the work he had begun was continued by a band of followers. Even today, the spirit of the Samaj is active in the towns and villages of India, as well as in communities of Indians who have emigrated to other parts of the world.

Asceticism

The term 'asceticism' is derived from the Greek word, askēsis*, which referred originally to the sort of exercise, practice or training in which athletes engage. Asceticism may be characterized as a voluntary, sustained and systematic programme of self-discipline and self-denial in which immediate sensual gratifications are renounced in order to attain some valued spiritual or mental state. Ascetic practices are to be found in all the major religious traditions of the world, yet they have often been criticized by philosophers. Some argue that the religious doctrines that they presuppose are false or unreasonable. Others contend that they express a preference for pain that humans cannot consistently act upon.*

The chief ascetic practices are fasting, sexual continence, living in seclusion, living in voluntary poverty, and inflicting pain upon oneself. Such practices are elements in all the major religious traditions, and at least some of them are found in most of the religions of non-literate people that anthropologists have studied. Some philosophical movements, such as Stoicism, which is not ordinarily classified as a religion, also endorse certain ascetic practices (see Stoicism §19). Ascetic practices are relatively common in Jainism, Tibetan Buddhism, early Christianity and various branches of Hinduism (see Jaina philosophy §3; Buddhist philosophy, Indian §2; Sanctification §1; Hindu philosophy §5); they are relatively uncommon in Confucianism, Zoroastrianism and Judaism. All the major religions condemn extreme forms of asceticism, but pathological excesses have appeared in every tradition.

Some forms of asceticism involve an attitude of detachment from worldly things. This is expressed in the scriptural injunction to be in the world but not of it and in the *Bhagavad Gītā*'s recommendation of renunciation in action but not of action. Max Weber described the disciplined, methodical and controlled pursuit of one's vocation in the world, as service to God that is characteristic of certain kinds of Protestant Christianity, as 'inner-worldly asceticism', because worldly success is valued not for its own sake but only as a confirmation of one's salvation.

In theistic religions the ultimate aim of ascetic practices is to promote union with the deity. Many Christian ascetics take self-inflicted pain to further their identification with the suffering Jesus who is God the Son. In Christianity, ascetic practices also have other functions. One is penitential. Self-denial is considered an appropriate way to make reparation for past misdeeds that have offended God. Another is disciplinary. Unruly bodily appetites are, in the fallen human condition, the source of much wrongdoing, and asceticism can serve to check and subdue or even to extirpate them.

Non-theistic religions propose various ends for ascetic practices. In Hindu traditions, awareness is fostered of one's true self (*ātman*), which is identical with the ground of all being (*Brahman*). Theravāda Buddhism promotes the extinction of desire, which in turn leads to freedom from suffering and the illusions of the phenomenal world and to ultimate liberation (*nirvāṇa*) (see Nirvāṇa). In such traditions, ascetic practices, particularly the self-infliction of pain, also function as penance for past evil deeds in this life or in previous incarnations.

The rationale for a particular ascetic practice varies from one religious tradition to another. Christianity, for example, recommends fasting on the grounds that it produces discomfort which can function either penitentially or as a means to identification with the suffering deity, while Yoga recommends it on the ground that it alleviates discomfort by eventually rendering one oblivious to the body and thus better able to direct energy to meditation (see Buddhism, Yogācāra school of). There are also differences concerning who should engage in the more severe forms of ascetic discipline. Often they are reserved for people with special religious vocations, such as monks or nuns. Ordinary believers are frequently told that the extreme asceticism of saints such as Simeon Stylites, who lived atop a pillar for nearly forty years, is to be admired but not imitated.

It is not surprising that asceticism has not found favour with most of those who subscribe to the worldview of secular modernity. It has been criticized by some important modern philosophers. Bentham (1789) argued that humans cannot consistently practise asceticism because they are by nature motivated to seek pleasure and to avoid pain (see Bentham, J. §2). Typically, however, ascetics do not seek pain for its own sake but rather as a means to something they take to be a great good such as union with God. That humans seek painful medical treatment for the sake of their health suffices to show that they can practise asceticism, including the infliction of pain on

themselves, if they perceive doing so as a means to some good end. Nietzsche represented ascetics as weak people who, being unable to exercise power over the strong, express their will to power by turning it on themselves and exercising power over their own appetites (see Nietzsche, F. §6). He also portrayed asceticism as a means by which religious leaders exercise power over their followers. It seems clear that such things are true in some cases, but history also provides examples of strong ascetics who, like Ignatius Loyola, were capable of exercising power over others yet chose instead to devote themselves to ascetic practices at certain stages of their lives.

Some critics are prepared to concede that moderate asceticism makes sense within religious contexts, but argue that it should be rejected because the religious assumptions offered to justify it are false or unreasonable. For example, it is sometimes alleged that asceticism presupposes an untenable dualism of mind and body or of matter and spirit (see Dualism). There are, however, non-dualistic forms of asceticism, and dualism, though it faces philosophical difficulties, has not been shown to be untenable. It is also alleged that belief in the existence of God or of *Brahman* is false or, at least, irrational belief (see God, arguments for the existence of).

Ash‘ariyya and Mu‘tazila

The Mu‘tazila - literally ‘those who withdraw themselves’ - movement was founded by Wasil bin ‘Ata’ in the second century AH (eighth century AD). Its members were united in their conviction that it was necessary to give a rationally coherent account of Islamic beliefs. In addition to having an atomistic view of the universe, they generally held to five theological principles, of which the two most important were the unity of God and divine justice. The former led them to deny that the attributes of God were distinct entities or that the Qur’an was eternal, while the latter led them to assert the existence of free will.

Ash‘ariyya - named after its founding thinker, al-Ash‘ari - was the foremost theological school in Sunni Islam. It had its origin in the reaction against the excessive rationalism of the Mu‘tazila. Its members insisted that reason must be subordinate to revelation. They accepted the cosmology of the Mu‘tazilites but put forward a nuanced rejection of their theological principles.

1 Historical survey

The Mu‘tazila originated in Basra at the beginning of the second century AH (eighth century AD). In the following century it became, for a period of some thirty years, the official doctrine of the caliphate in Baghdad. This patronage ceased in AH 238/ AD 848 when al-Mutawakkil reversed the edict of al-Ma’mun, which had required officials to publicly profess that the Qur’an was the created word of God. By this time, however, Mu‘tazilites were well established in many other centres of Islamic learning, especially in Persia, and had split into two rival factions, the Basran School and the Baghdad School. Although their links with these two cities became increasingly tenuous, both schools flourished until the middle of the fifth century AH (eleventh century AD), and the Basran School only finally disappeared with the Mongol invasions at the beginning of the seventh century AH (thirteenth century AD). After the demise of the Mu‘tazila as a distinct movement, Mu‘tazilite doctrine - by now regarded as heretical by Sunnis - continued to be influential amongst the Shi‘ites in Persia and the Zaydis in the Yemen.

Al-Ash‘ari (d. AH 324/AD 935) was a pupil of Abu ‘Ali al-Jubba’i (d. AH 303/AD 915), the head of the Basran School. A few years before his master’s death, al-Ash‘ari announced dramatically that he repented of having been a Mu‘tazilite and pledged himself to oppose the Mu‘tazila. In taking this step he capitalized on popular discontent with the excessive rationalism of the Mu‘tazilites, which had been steadily gaining ground since their loss of official patronage half a century earlier. After his conversion, al-Ash‘ari continued to use the dialectic method in theology but insisted that reason must be subservient to revelation. It is not possible to discuss al-Ash‘ari’s successors in detail here, but it should be noted that from the second half of the sixth century AH (twelfth century AD) onwards, the movement adopted the language and concepts of the Islamic philosophers whose views they sought to refute. The most significant thinkers among these later Ash‘arites were al-Ghazali and Fakhr al-Din al-Razi.

2 Cosmology

Popular accounts of the teaching of the Mu‘tazilites usually concentrate on their distinctive theological doctrines. To the philosopher, however, their cosmology, which was accepted by the Ash‘ariyya and other theological schools, is a more appropriate starting point.

To the Mu‘tazila, the universe appears to consist of bodies with different qualities: some are living while others are inanimate, some are mobile while others are stationary, some are hot and some are cold, and so on. Moreover, one and the same body may take on different qualities at different times. For instance, a stone may be mobile when rolling down a hill but stationary when it reaches the bottom, or hot when left in the sun but cold after a long night. Yet there are some qualities which some bodies cannot acquire; for example, stones are invariably inanimate, never living. How are the differences between bodies, and between one and the same body at different times, to be explained?

The answer given by the Mu‘tazilites is that all bodies are composed of identical material substances (*jawahir*) or atoms (*ajza’*), on which God bestows various incorporeal accidents (*a‘rad*). This view was first propounded by Dirar ibn ‘Amr (d. *c.*AH 200/AD 815) and elaborated by Abu al-Hudhayl (d. AH 227/AD 841 or later), both of whom

were early members of the Basran School. Abu al-Hudhayl held that isolated atoms are invisible mathematical points. The only accidents which they can be given are those which affect their ability to combine with other atoms, such as composition or separation, motion or rest. Conglomerates of atoms, on the other hand, can be given many other accidents such as colours, tastes, odours, sounds, warmth and coldness, which is why we perceive them as different bodies. Some of these accidents are indispensable, hence the differences between bodies, whereas others can be bestowed or withdrawn, thus explaining the differences between one and the same body at different times.

This account of the world gained rapid acceptance amongst Islamic theologians, although to begin with it was rejected by two Mu'tazilites of the Basran School, al-Nazzam (d. AH 221/AD 836) and Abu Bakr al-Asamm (d. AH 201/AD 816?). The former, who was Abu al-Hudhayl's nephew, argued that atoms which were mere mathematical points would not be able to combine with one another and that, rather than being composed of atoms, bodies must therefore be infinitely divisible. Abu al-Hudhayl replied that God's bestowal of the accident of composition on an isolated atom made it three-dimensional and hence capable of combining (see Atomism, ancient). Al-Asamm, on the other hand, objected to the notion of accidents, arguing that since only bodies are visible their qualities cannot have an independent existence. Abu al-Hudhayl retorted that such a view was contrary to divine laws because the legal obligations and penalties for their infringement were not directed at the whole person but at one of his 'accidents', such as his prostration in prayer or his flagellation for adultery.

3 The five principles

According to the Muslim heresiographers, who are our main source of information about the Mu'tazila, members of the movement adhered to five principles, which were clearly enunciated for the first time by Abu al-Hudhayl. These were: (1) the unity of God; (2) divine justice; (3) the promise and the threat; (4) the intermediate position; and (5) the commanding of good and forbidding of evil.

The first and second principles are of major importance and will be discussed in detail below. The third principle is really only an adjunct of the second, and is here treated as such. The fourth principle is a relatively unimportant doctrine which probably only figures in the list because it was thought to have been the reason for the Mu'tazila's emergence as a distinct movement; it is said that when Hasan al-Basri was questioned about the position of the Muslim who committed a grave sin, his pupil Wasil bin 'Ata' said that such a person was neither a believer nor an unbeliever, but occupied an intermediate position. Hasan was displeased and remarked, 'He has withdrawn from us (*i'tazila 'anna*)', at which Wasil withdrew from his circle and began to propagate his own teaching. The historicity of this story has been questioned on the ground that there are several variants: according to one version the person who withdrew was Wasil's associate 'Amr ibn 'Ubayd (d. AH 141/AD 761), and according to another the decisive break came in the time of Hasan's successor Qatada. Moreover it is noteworthy that at least one influential member of the Basran school, Abu Bakr al-Asamm, rejected the notion of an intermediate position and argued that the grave sinner remained a believer because of his testimony of faith and his previous good deeds. This was also the view of the Ash'arites.

The fifth principle, which is derived from several passages in the Qur'an (for example, Surah 9: 71), and which the Mu'tazilites understood as an obligation incumbent on all Muslims to intervene in the affairs of state, was rarely put into practice. For the Ash'arites, the commanding of good and forbidding of evil was the prerogative of the head of state, who acted on behalf of the Muslim community.

4 The unity of God

The first half of the *shahada*, the Muslim declaration of faith, is the testimony that there is no god besides Allah. Thus the numerical unity of God is axiomatic for all Muslims. Nevertheless, although the Qur'an explicitly asserts that God is one, and equally explicitly rejects polytheism and the Christian doctrine of the Trinity, it speaks of God's 'hands' (Surah 38: 75), 'eyes' (Surah 54: 14) and 'face' (Surah 55: 27), and of his seating himself on his throne (Surah 20: 5), thus apparently implying that he has a body. Moreover, in describing the radiant faces of believers 'looking towards their Lord' on the Day of Resurrection (Surah 75: 23), it suggests the possibility of a beatific vision.

However, the Mu'tazilites emphatically rejected such notions, insisting that God is not merely numerically one but

also that he is a simple essence. This led them to deny that he has a body or any of the characteristics of bodies such as colour, form, movement and localization in space; hence he cannot be seen, in this world or the next. The Mu‘tazila therefore interpreted the Qur’anic anthropomorphisms as metaphors - God’s ‘hands’ are his blessing, God’s ‘eyes’ are his knowledge, his ‘face’ is his essence and his seating himself on his throne is his omnipotence - and argued that, since the Qur’an elsewhere asserts that ‘sight cannot reach Him’ (Surah 6: 103), the phrase *ila rabbiha nazira* means ‘waiting for their Lord’ rather than looking towards him.

Some of the later Ash‘arites accepted the Mu‘tazilite position on the Qur’anic anthropomorphisms. In al-Ash‘ari’s own view, however, they are neither to be dismissed in this way nor understood to imply that God has a body like human beings. They are ‘revealed attributes’, whose existence must be affirmed without seeking to understand how (*bi-la kayfa*). Furthermore, the possibility of beatific vision depends not on God’s embodiment, but on his existence. God can show us everything which exists. Since he exists, he can therefore show us himself. Hence the statement that ‘sight cannot reach Him’ must apply only to this world, where he impedes our vision.

Much more problematic than the Qur’an’s anthropomorphisms are the adjectives which it employs to describe God. He is said, for instance, to be ‘living’, ‘knowing’, ‘powerful’ and ‘eternal’. If we deny these qualities to God, we must then attribute to him their opposites, which are imperfections. But God is by definition free from imperfections; therefore God must always have had these qualities. But does this mean that he possesses the attributes of ‘life’, ‘knowledge’, ‘power’ and ‘eternity’ and that they are distinct from his essence? The Mu‘tazilites reasoned that this was impossible because it would imply plurality in the Godhead. When we speak of God as ‘living’, ‘knowing’, ‘powerful’ and ‘eternal’, we are, in their opinion, merely considering him from different points of view. God’s ‘attributes of essence’ (*sifat al-dhat*), as they are generally called, are a product of the limitations and the plurality of our own intellectual faculties; in reality, they are identical with God’s essence. Thus, according to al-Ash‘ari (*Maqalat*: 484), Abu al-Hudhayl maintained that ‘God is knowing by virtue of a knowledge which is His own essence’ and that he is likewise powerful, living and eternal by a power, a life and an eternity which are none other than his own essence. Al-Nazzam expressed this even more forcefully when he said, ‘If I say that God is knowing, I merely confirm the divine essence and deny in it all ignorance. If I say that God is powerful, living and so forth, I am only confirming the divine essence and denying in it all powerlessness, mortality and so forth’ (*Maqalat*: 484).

Al-Ash‘ari himself rejected this reductionist account of the ‘attributes of essence’ which made them artefacts of human reason, but his arguments for doing so are far from compelling. He alleged that since in the case of human beings knowing implies possessing knowledge as an entity distinct from the knower, the situation with God must be analogous. Hardly more cogent is the claim that if God knew by his essence, he would be knowledge. Finally, al-Ash‘ari’s assertion that the ‘attributes of essence’ are neither other than God nor identical with him is simply a retreat into paradox. However, al-Ash‘ari was not alone in wishing neither to affirm the independent existence of these attributes nor to deny it outright. Al-Jubba’i’s son Abu Hashim (d. AH 321/AD 933) attempted to resolve the problem by introducing the idea of ‘state’ (*hal*). A state is not something which exists or which does not exist; it is not a thing and it cannot be known in itself, only with an essence. Nevertheless it has an ontological reality. According to Abu Hashim, there are in God permanent states such as ‘his mode of being knowing’ (*kawnuhu ‘aliman*), ‘his mode of being powerful’ and so forth, which give rise to distinct qualicatives. This compromise was accepted by many of Abu Hashim’s fellow Mu‘tazilites of the Basran school, but was unanimously rejected by those of Baghdad.

In addition to the attributes of essence, the Qur’an employs a whole series of adjectives such as ‘providing’ and ‘forgiving’, which describe God in relation to his creatures. It is easy to imagine a time when God did not have these attributes. The Mu‘tazilites called these ‘attributes of action’ (*sifat al-fi‘l*) because they deemed them to come into being when God acts. In their reckoning, God’s ‘speech’ belongs to this category of attributes, for it does not make sense to think of his commandments as existing before the creation of the beings to whom they are addressed. Thus the Qur’an itself, although the Word of God, is temporal and not eternal. It was created initially in the ‘guarded tablet’ (Surah 85: 22) and subsequently recreated in the hearts of those who memorize it, on the tongues of those who recite it and on the written page. Although not denying the existence of attributes of action, al-Ash‘ari insisted that ‘speech’ - along with ‘hearing’ and ‘vision’ - was an attribute of essence. He argued that if God’s word were not eternal, it would have had to have been brought into being. Furthermore, since it is an attribute, it could not have been brought into being other than in an essence in which it resides. In which case

either God brought it into being in himself, or he brought it into being in another. But if he had brought it into being in himself, he would be the locus of things which come into being, which is impossible. If, on the contrary, he had brought it into being in another, it is the other, and not God, who would have spoken by the word.

5 Divine justice and human destiny

In addition to championing the unity of God, the Mu‘tazilites stressed his justice. They held that good and evil are objective and that the moral values of actions are intrinsic to them and can be discerned by human reason. Hence God’s justice obliges him to act in accordance with the moral law. For instance, he is thus bound to stand by his promise to reward the righteous with paradise and his threat to punish the wicked with hellfire. More importantly, the reward and punishment which he metes out must be merited by creatures endowed with free will (see Free will). Thus although the Qur’an says that God guides and leads astray those whom he wills (Surah 14: 4), it cannot mean that he predestines them. This and similar texts refer rather to what will happen after the judgement, when the righteous will be guided to paradise and the wicked will be caused to stray far from it. With regard to our acts in this world, God creates in us the power to perform an act but we are free to choose whether or not to perform it.

Many of the Mu‘tazilites held that the principle of justice made it requisite for God always to do for people what was to their greatest advantage. Al-Jubba’i went as far as to claim that God is bound to prolong the life of an unbeliever if he knows that the latter will eventually repent. In view of this, al-Ash‘ari is alleged to have asked him about the likely fate of three brothers: a believer, an unbeliever and one who died as a child. Al-Jubba’i answered that the first would be rewarded, the second punished and the third neither rewarded nor punished. To the objection that God should have allowed the third to live so that he might have gained paradise, al-Jubba’i replied that God knew that had the child lived he would have become an unbeliever. Al-Ash‘ari then silenced him by asking why in that case God did not make the second brother die as a child in order to save him from hellfire!

For al-Ash‘ari, divine justice is a matter of faith. We know the difference between good and evil solely because of God’s revelation, and not by the exercise of our own reason. God makes the rules and whatever he decrees is just, yet God himself is under no obligation: if he wished, he could punish the righteous and admit the wicked to paradise (see Voluntarism). Moreover, to suppose as the Mu‘tazilites did that human beings had free will would be to restrict the sovereign freedom of the creator. On the contrary, God creates in his creature both the power and the choice; then he creates in us the actions which correspond to these. Nevertheless, we are conscious of a difference between some actions, such as the rushing of the blood through our veins, which are involuntary, and others, such as standing up or sitting down, which are in accordance with our own will. Al-Ash‘ari argues that by approving of these latter actions, which God created in us, we ‘acquire’ them and are thus held responsible for them.

Asmus, Valentin Ferdinandovich (1894-1975)

One of the most accomplished thinkers in the Soviet Marxist tradition, Asmus wrote extensively in many areas of philosophy, and was widely regarded as the Soviet Union's principal Kant scholar. Early in his career, he became associated with the influential school of 'dialecticians' led by A.M. Deborin and produced a number of significant writings in the history of philosophy. When Deborin and his followers were condemned as 'Menshevizing idealists' in 1931, Asmus shifted the principal focus of his work to aesthetics and logic. His 1947 textbook of formal logic subsequently became the principal text for logic instruction in the USSR.

Throughout his long career, Asmus experienced a number of political difficulties. Nevertheless, he avoided imprisonment and published consistently, though he was never permitted to go abroad. His importance in Russian philosophy derives not so much from the significance of his theories, but from his role in preserving philosophical culture in Russia through the Stalin period. He aspired to high standards of scholarship and worked hard to foster the study of logic and the history of philosophy. The breadth of his interests and his excellence as a teacher made him an inspirational figure to the young scholars striving to revive Soviet philosophy in the 1960s.

1 Life

V.F. Asmus was born in Kiev. In 1919, he graduated from Kiev University, where he studied with V.V. Zenkovsky and A.N. Giliarov. Asmus taught philosophy and aesthetics in Kiev for a number of years, until he was appointed to Moscow's Institute of Red Professors in 1927. There his expert appreciation of the history of philosophy made him an ally of the school of 'dialecticians' led by Abram Deborin, which dominated the Soviet philosophical institutions at that time. Asmus participated in the dialecticians' controversies with Soviet positivists, or 'mechanists', and in the later conflicts with Party activists 'on the philosophical front' that led in 1931 to the dissolution of Deborin's school. Although condemned as a 'Menshevizing idealist' and temporarily denied the right to teach, Asmus was spared the fate that befell many Deborinites in the purges, probably because of his 'non-Party' status.

As Soviet philosophy increasingly became an instrument for the propagation of Party ideology, so Asmus shifted the focus of his work to aesthetics and the philosophy of literature, becoming a member of the Writer's Union in 1935 and completing his doctoral dissertation on 'Aesthetics in Classical Greece' in 1940, the first thesis to be defended at Moscow's Institute of Philosophy. Asmus could not, however, elude political controversy altogether. In 1938, he was endangered by his former association with Bukharin, though he fortuitously escaped arrest. And in 1944, Asmus was among the authors of the third volume of the *Istoriia filosofii (History of Philosophy)*, edited by G.F. Aleksandrov *et al*., which the Central Committee withdrew from publication because its sympathetic treatment of German idealism was deemed inappropriate in the climate of anti-German feeling provoked by the Great Patriotic War. It was fortunate for the contributors that they had earlier received the Stalin prize for an earlier volume. Thereafter Asmus, who had been a professor at Moscow University since 1939, sought refuge in its Department of Logic where he made an important contribution to the development of formal logic in Russia. He returned to the history of philosophy only after the Stalin period. A close friend of Boris Pasternak's, Asmus is reputed to have influenced the philosophical content of *Doctor Zhivago*. In 1960, he was once again embroiled in controversy when he gave a eulogy at Pasternak's graveside. Asmus continued to work actively in philosophy until his death.

2 Ideology, culture and explanation

Among the works which brought Asmus into the limelight was his debate with the mechanist A. (Sandor) Var'iash, published in *Pod znamenem marksizma (Under the Banner of Marxism)* (in 1926-7). In his *Istoriia novoi filosofii (History of Modern Philosophy)* (1926), Var'iash argues that if Marxism is to provide a consistently monist account of reality, it must explain how all forms of ideological activity, including literature, science and philosophy, arise from specific socioeconomic relations. By this, Var'iash means not just that philosophical or scientific theories cannot be understood without reference to the historical circumstances of their emergence, but that both the content and the logical structure of theories are ultimately causally determined by the forces of production. Var'iash's work examines how such causal relations can be traced. In reply, Asmus maintains that Var'iash succeeds in demonstrating only that, for any era, a correspondence exists between the social needs

defined by the relations and forces of production and the general themes of scientific research. Asmus argues that it is in principle impossible to derive the logical characteristics of a theory from considerations about the socio-historical conditions of its production, and that Var'iash's position must ultimately collapse into a disastrous relativism, for unless we distinguish between the 'genetic' analysis of a theory's origins and the logical analysis of its content, the concepts of proof and truth will be undermined. In addition, Asmus rejects Var'iash's view that the causal determination between 'economic base' and 'ideological superstructure' proceeds only in one direction.

The controversy is sometimes portrayed as a conflict between Var'iash's 'vulgar sociological' approach and Asmus' cultured historicism. This is misleading, for Var'iash was aware of his position's counter-intuitive aspects and developed his case with considerable ingenuity, while Asmus was sometimes overconfident in his arguments, no doubt because he knew they would find favour with the Deborinite orthodoxy. Nevertheless, the debate is testimony to the vigour and seriousness of Soviet philosophy in the 1920s, and illustrates Asmus defending the irreducibility of cultural phenomena against positivist or crude Marxist conceptions, a position which became a leitmotif of his work.

3 Philosophy and its past

One theme prominent in Asmus' dispute with Var'iash is the nature of philosophy's relation to its past. For Asmus, Marxism represents the outgrowth of a long historical development and incorporates insights from many philosophical positions. The history of philosophy is not simply a history of previous error. Accordingly, Asmus sought throughout his career to uphold standards of historical scholarship in philosophy, both in his own writings on ancient, early modern and nineteenth-century Russian philosophy, and in the many collaborative projects in which he was engaged. He was particularly well known for his studies of Kant, for whose thought he had a special affection.

Asmus' approach to the history of philosophy is exemplified by his *Ocherki istorii dialektiki v novoi filosofii (Essays on the History of Dialectics in Modern Philosophy)* (1930). Here he argues that dialectic represents a method of cognition, designed to capture how development occurs through the resolution of contradiction. Asmus traces the origins of Marx's conception of dialectic in the work of Descartes, Spinoza, Kant, Schelling, Fichte and Hegel. He argues that it was Kant who first grasped the significance of dialectical contradiction, though he mistakenly confined its influence to the realm of thought. Hegel, in contrast, correctly discerned that the development of being itself is dialectical, but his account is belied by his idealist metaphysics and teleological conception of history. It was Marx and Engels, Asmus argues, who identified the true empirical content of Hegel's system and turned dialectic into a method for the analysis of real human history.

Though Asmus' exposition conforms to the standard Soviet vision of philosophy's history, it contains many subtleties, both in the detailed accounts of particular philosophers and in his appreciation of the complexities of Marx's method. Though Asmus invokes familiar dialectical materialist formulas (such as the triad of thesis-antithesis-synthesis) to characterize the structure of dialectical development, he is adamant that all such schema represent crude simplifications. The central feature of Marx's dialectical method, he argues, is its sensitivity to the specific logic of development of particular objects of cognition, a sensitivity which cannot be captured in principles or schema. Thus no substantive content-neutral specification of dialectical method is possible. This view, undeveloped in the Stalin period, was later explored by Soviet thinkers in the 1960s.

For Asmus, the history of philosophy culminates in the final emancipation of humanity: Marxism renders transparent the laws of historical development and permits human beings to harness the forces which have hitherto shaped their lives. The relation of freedom and necessity is thus a pervasive theme in Asmus' historical writings. Like many of his Soviet colleagues, he follows Engels and Plekhanov in maintaining that freedom and necessity are not irreconcilable; we are free when we act consciously in full appreciation of the laws which govern our deeds. The proletariat, the first class to understand the circumstances of its own agency, thus reconciles freedom and necessity in its very practice.

As will be evident, Asmus presents a view of philosophy's development hardly less teleological than Hegel's, and in his more encyclopedic writings he is inclined to represent each pre-Marxist philosopher's contribution as a combination of 'progressive' and 'reactionary' elements, the former contributing to the eventual emergence of Marxism, the latter the result of constraints imposed by the socioeconomic climate in which the philosopher

worked. For example, his entry on Kant in the Soviet *Filosofskaia ėntsiklopediia (Philosophical Encyclopedia)* (1962) concludes by chiding Kant for his ‘agnostic’ denial that we can have knowledge of things-in-themselves, his ‘subjective idealist’ view of cognition as the imposition of a priori categories on the deliverances of experience, and his ‘formalistic’ approach to ethics and aesthetics. At the same time Asmus praises Kant’s insights about dialectical contradiction, his concern with the justification of scientific knowledge, and his view of aesthetics as transcending the conflict between theoretical and practical reason. Asmus’ scholarly writings, in contrast, provide a more nuanced (though no less linear) account of philosophy’s development and transcend the Manichean vision that dominates so much Soviet philosophical writing.

4 Logic and aesthetics

Asmus had an important influence on the study of logic in the USSR. In the 1930s and 1940s, it was widely held that formal logic’s allegiance to the law of non-contradiction made it ill-suited to represent dialectical thinking; formal logic must be supplanted by a higher ‘dialectical logic’. As a result, the study of formal logic was almost totally neglected. Alarmed by this, the Central Committee invited Asmus to write an elementary logic text. The work, published in 1947, was widely used and logic was gradually rehabilitated (though controversies about the relation of formal and dialectical logic continued into the 1970s). Though Asmus felt himself ill-equipped to pursue studies in mathematical logic, he did much to encourage its development at Moscow University. He also continued to write on broadly logical topics, particularly on the concept of proof (1954). In this work, Asmus denies that there is a sharp distinction between logical and empirical argument, and maintains that all axioms and definitions have empirical content and derive their justification ultimately from their role in human practice.

Asmus also made significant contributions to Soviet aesthetics. In addition to studies in classical aesthetics, he produced erudite and insightful pieces on Goethe, Lermontov, Tolstoi and Schiller.

5 Asmus’ legacy

Asmus will be remembered not so much for the novelty of his philosophical ideas as for his contribution to the survival of philosophical culture in Russia during the most oppressive periods of Soviet history. Though his work cannot be compared to that of Losev (who reputedly felt that Asmus had squandered his philosophical talents) and Bakhtin, there is no denying the extent of his influence on his peers and students, particularly the younger generation of philosophers who sought to reanimate Soviet philosophy in the late 1950s and early 1960s. For them, Asmus was an inspiring teacher who represented a living connection with the traditions of the pre-Stalin period and a writer whose breadth of interests and scholarly integrity were unparalleled among Soviet Marxists.

Astell, Mary (1666-1731)

Best known for her proposal to establish a women's college, Astell published on a variety of other topics: religious dissent, the social contract, the marriage contract, epistemic issues, mind-body dualism, immortality, proofs for God's existence, reason and revelation, and Locke's views on 'thinking matter'. Her correspondence with John Norris treated the pure love of God and occasionalism. On marriage she drew a shrewd contrast between the treatment of political tyranny by contractarians (such as Locke), and their failure to deal with domestic tyranny. Some of her reactions to the views of major philosophers anticipated later debates.

1 Philosophical influences on life and works

Mary Astell gained notoriety in her native England and beyond for *A Serious Proposal to the Ladies…* (1694), which advocated the founding of an Anglican academy for women. *Letters Concerning the Love of God* (1695) followed - her side of this correspondence with Cambridge Platonist John Norris was praised by Leibniz. Having failed to get support for her educational institution, Astell offered women a manual for improving their understanding: *A Serious Proposal to the Ladies, Part II* (1697) drew on Lockean views, Cartesian 'method', and the Port Royal *Logic* (see Port-Royal). After examining the marriage contract in *Some Reflections Upon Marriage* (1700), Astell became a pamphleteer on religious and political topics, criticizing Defoe, Swift, Shaftesbury and Locke. (Swift retaliated by satirizing her in the *Tatler*.) *The Christian Religion…* (1705) responded to Locke, Damaris Masham and Archbishop Tillotson. Her circle of friends included Lady Mary Wortley Montagu, for whose posthumously published letters she wrote a preface, and the Anglo-Saxon scholar Elizabeth Elstob.

2 Social and political thought

According to Springborg (1996), the real focus of Astell's *Reflections Upon Marriage* is the 'absurdity of contractarian voluntarism'. Here, and in her pamphlets, Astell wants to show that contractarians such as Locke are reluctant to accept arguments against domestic tyranny on the basis of consent, while they press these arguments against the state. Indeed, Springborg suggests that Astell may be the first systematic commentator on Locke's *Two Treatises of Government*.

In *Moderation Truly Stated…* (1704a) and *An Impartial Enquiry into the Causes of Rebellion and Civil War in This Kingdom* (1704c), Astell defended the royalist cause and the Established Church, while challenging the work of James Owen and Charles Davenant; *A Fair Way with the Dissenters…* (1704b) attacked Defoe; *Bart'lemy Fair or an Enquiry after Wit* (1709) criticized Shaftesbury's *Letter Concerning Enthusiasm* and charged Swift with irreligion.

3 The rejection of occasionalism

In *Letters Concerning the Love of God*, Norris had argued that God should be the sole object of our love and that Malebranche's occasionalism ensures this conclusion (see Occasionalism): all our perceptions and sensations, all our sources of pleasure, are caused solely by God. Astell had reservations about this view and, before allowing the correspondence to be published, appended a letter arguing specifically against occasionalism. Her criticisms are prefigured in medieval debates on secondary causation. The first is that 'it seems more agreeable to the Majesty of God, and that Order he has established in the World, to say that he produces our Sensations mediately by his Servant Nature, than to affirm that he does it immediately by his own Almighty Power' (1695: 281-2). Although Aquinas' *Summa Contra Gentiles* and Molina's *Concordia* had advanced similar arguments, this objection is not conclusive (see Aquinas §3; Molina, L. de). For occasionalists, to hold that God concurs with secondary causes is to hold that God's own causal role in natural change is not sufficient to determine effects in all their specificity. They can therefore claim that their doctrine is more consistent with God's majesty than that of concurrence.

Astell's other objection is more powerful: if bodies contain 'nothing in their own Nature to qualify them to be instrumental to the Production of… sensations' (1695: 279), and if God is sufficient to cause these natural changes, then it seems God has created bodies in vain - which would be contrary to God's perfection. Aquinas had stated a like objection in *Summa Contra Gentiles*.

In place of occasionalism, Astell maintains that sensation is directly caused by mind-body interaction, and

mediately caused by God. She goes beyond this Cartesian account to suggest that something like More's Neoplatonic 'plastic part of the soul' might explain the agreement between external objects and sensations (see More, H.).

4 Other metaphysical topics

The Christian Religion… attempts (1) to show how religious belief can and should be grounded in reason, (2) to determine the roles of reason and revelation, (3) to encourage women to examine Christian doctrines rationally, and (4) to examine the obligations that determine Christian practice. Towards these ends, Astell critically evaluates Archbishop Tillotson's sermons, Locke's *The Reasonableness of Christianity*, Masham's *A Discourse Concerning the Love of God*, and the anonymous *Ladies' Religion*. In place of the Socinianism and scepticism she finds there, she offers her own rational accounts of revelation and Christian practice, which frequently rely on substantive metaphysical arguments (see Socinianism). For example, in addition to an ontological argument for God's existence, Astell offers a cosmological argument that turns on a 'causal likeness principle' different from that of Descartes. Her argument is vulnerable, none the less, to the well-known criticisms of Descartes' version.

She also offers a two-part argument for the immortality of the human mind: first she argues for the immortality of immaterial things, and then offers a 'real distinction' argument to prove that the mind contains none of the properties of extended matter. Her Platonic first argument bears a striking resemblance to that of Leibniz for the 'natural indestructibility' of monads:

> A Being is Mortal and Corruptible, or ceases to Be, when those Parts of which it consists… are no longer thus or thus United…. Hence it follows, That a Being which is Uncompounded, which has no Parts, and which is therefore incapable of Division and Dissolution, is in its own Nature Incorruptible…. If then the Mind be Immaterial, it must in its own Nature be Immortal.
>
> (Astell 1705: 248-9, §§257-8)

In response to the possibility of divine annihilation, she adds: 'He does nothing in vain, and can't be suppos'd to Make a Creature with a design to Destroy or Unmake it'. In addition to depending upon speculation about the 'purposes of God', this response also does not address an issue which also remained for Leibniz: the possibility of instantaneous *natural* annihilation.

Astell's version of the real distinction argument is especially of interest in light of twentieth-century interpretations of Descartes' argument as an epistemic one (Wilson 1978). She reasons:

> When two Complete Ideas… have different Properties and Affections, and can be consider'd without any Relation to, or Dependance on each other, so that we can be sure of the Existence of the one, even at the same time we can suppose that the other does not Exist, as is indeed the case of a Thinking and of an Extended Being, or of Mind and Body; here these two Ideas, and consequently the things they represent, are truly Distinct and of Different Natures.
>
> (Astell 1705: 248-9, §§257-8)

Astell regarded the foregoing arguments and their theological consequences as threatened by the possibility of Locke's 'thinking matter'. She notes that according to Locke's *Essay*:

> it is impossible for *a Solid Substance to have Qualities, Perfections, and Powers, which have no Natural or Visible Connexion with Solidity and Extension*; and since there is no Visible Connexion between Matter and Thought, it is *impossible for Matter*, or *any Parcels of Matter to Think*.
>
> (Astell 1705: 259, §267)

This view parallels what Margaret Wilson has called Locke's 'official position': all properties and powers of an object 'stand in comprehensible or conceivable relations to its Boylean "primary qualities"' (1979: 144). Like Wilson, Astell argues that this position is inconsistent with Locke's view in his third letter to Stillingfleet: '*Some Parcels of Matter be so order'd by Omnipotence as to be endued with a Faculty of Thinking*' (Astell 1705: 259, §267). Astell concludes that God's superaddition of thought to matter could only create an 'Arbitrary Union' between matter and the faculty of thought, so that 'it is not Body that Thinks, but the mind that is United to it, Body being still as incapable of Thought as it ever was' (1705: 261, §269).

Atheism

Atheism is the position that affirms the nonexistence of God. It proposes positive disbelief rather than mere suspension of belief. Since many different gods have been objects of belief, one might be an atheist with respect to one god while believing in the existence of some other god. In the religions of the west - Judaism, Christianity and Islam - the dominant idea of God is of a purely spiritual, supernatural being who is the perfectly good, all-powerful, all-knowing creator of everything other than himself. As used in this entry, in the narrow sense of the term an atheist is anyone who disbelieves in the existence of this being, while in the broader sense an atheist is someone who denies the existence of any sort of divine reality. The justification of atheism in the narrow sense requires showing that the traditional arguments for the existence of God are inadequate as well as providing some positive reasons for thinking that there is no such being. Atheists have criticized the traditional arguments for belief and have tried to justify positive disbelief by arguing that the properties ascribed to this being are incoherent, and that the amount and severity of evils in the world make it quite likely that there is no such all-powerful, perfectly good being in control.

1 The meaning of ‘atheism’

As commonly understood, atheism is the position that affirms the nonexistence of God. So an atheist is someone who disbelieves in God, whereas a theist is someone who believes in God. Another meaning of ‘atheism’ is simply nonbelief in the existence of God, rather than positive belief in the nonexistence of God. These two different meanings are sometimes characterized as positive atheism (belief in the nonexistence of God) and negative atheism (lack of belief in the existence of God). Barring inconsistent beliefs, a positive atheist is also a negative atheist, but a negative atheist need not be a positive atheist. One advantage of using ‘atheism’ in these two different senses is that negative atheism, but not positive atheism, characterizes the position of the logical positivists, who hold that statements purportedly about God, including the statement ‘God does not exist’, are cognitively meaningless. If one holds that the statements ‘God exists’ and ‘God does not exist’ are cognitively meaningless, and therefore neither true nor false, one cannot consistently believe that it is true that God does not exist or that it is true that God does exist. So the logical positivist cannot espouse positive atheism, but can be characterized as espousing negative atheism. Nevertheless, since the common use of ‘atheism’ to mean disbelief in God is so thoroughly entrenched, we will follow it. We may use the term ‘non-theist’ to characterize the position of the negative atheist. So instead of saying that the logical positivist is a negative but not a positive atheist, we shall say that the logical positivist is a non-theist but not an atheist.

Since human beings have worshipped many different gods, what god or gods is it whose existence, if denied, makes one an atheist? Generally, it is the dominant or official god of one’s country or culture that plays that role. (Early Christians were called atheists because they rejected belief in the official gods of the Roman state.) But given that there are a number of different conceptions of the divine in a given culture, it is best to distinguish a restricted or narrow sense of ‘atheism’ and ‘theism’ from a broader sense. In the major religions of the West - Judaism, Christianity and Islam - the traditional conception of God is of a purely spiritual, supernatural being who is the perfectly good, all-powerful, all-knowing creator of everything other than himself. As used in this entry, an atheist in the narrow sense of the term is anyone who disbelieves in the existence of this being, just as a theist in the narrow sense is anyone who believes in the existence of this being. In the broader sense, a theist is someone who believes in the existence of any divine being or divine reality, even if it is quite different from the idea of God just described. Similarly, an atheist, in the broader sense of the term, is someone who disbelieves in every form of deity, not just the God of traditional Western theology.

To avoid confusion, it is important to keep in mind both the narrow and the broader senses of these terms. In the narrow sense, the Protestant theologian Paul Tillich (§2) was an atheist, for he disbelieved in the existence of the God of traditional theism. But in the broader sense he was a theist, since he believed that there is a divine reality, being-itself (the God beyond the traditionalistic theistic God). The chief concern of this entry will be an investigation of the reasons supporting atheism in the narrow sense. While someone may readily undertake to give reasons for thinking that the God of traditional Western theology does not exist, it would be a vastly larger task to review all the ideas of the divine that human beings have generated over time and then undertake to justify belief in the nonexistence of each divine being or divine reality.

2 Historical sketch of Western atheism

Perhaps the best way to understand the struggle between atheism and theism is to note theism's insistence on an agent explanation of various natural phenomena, including the existence of the universe. We typically explain our actions and their results in terms of our purposes and our power as agents to make things happen. When the idea that the sun, moon and stars are themselves agents was abandoned, it seemed reasonable to explain their movements, and other natural happenings in the world, as the result of powerful agents (gods) acting upon inert material bodies. Thus the gods served to explain events in nature for which no other explanation was then available, particularly events directly affecting human welfare. And by worshipping and beseeching the gods, human beings undoubtedly hoped to influence the course of natural events in their favour.

The seeds of atheism in Western society were sown with the beginning of science. For the trend of science over the centuries has been to replace explanations of natural events by the activity of divine agents with explanations by means of other natural phenomena (see Religion and science §§1-3). As early as Epicurus, one finds an explicit attempt to rule out any explanation of natural phenomena by reference to the activity of supernatural agents (see Epicureanism §§8-9). But while it is one thing to observe the steady retreat of the gods from a significant place in explanations of phenomena within nature, it is quite another thing to discredit the view that the natural universe itself owes its existence to the creative activity of a supernatural deity. Moreover, the appearance of design in plants and animals made it difficult to find a plausible explanation in something other than the activity of an intelligent being. So, although the growth of the natural sciences did much to remove human dependence on the gods to explain events within nature, a foothold in ultimate explanations still remained; and certain phenomena in nature, particularly the apparent design in plants and animals, continued to suggest an intelligent being exercising a causal influence within nature. An attack on the need and possibility of ultimate explanations was left to philosophers, particularly to Hume (§6) and Kant (§8), although the argument from design received its most devastating blow from the work of Darwin and Wallace in the nineteenth century. It is not surprising, therefore, that atheism has flourished in the nineteenth and twentieth centuries, being advocated by such influential thinkers as Feuerbach, Nietzsche, Marx, Freud, Russell and Sartre.

3 Justification of atheism: insufficiency of proofs of the existence of God

As noted above, this entry will focus primarily on the reasons given in support of atheism in the narrow sense, the view that the God of traditional Western theology does not exist. If atheism in the narrow sense is to be established or shown to be probably true, two different sorts of reasons need to be given. First, one must give reasons that would be sufficient to justify disbelief in God if they constituted the only reasons we have that bear on the question of God's existence. Second, one must refute or show the insufficiency of reasons that have been given to justify belief in God. The necessity of the second undertaking is due to the possibility that reasons in support of a claim may outweigh reasons against the claim. The necessity of the first undertaking is due to the general principle that in the absence of good reasons in support of a claim the proper response is suspension of belief rather than disbelief. However, if we were to have sufficient reason to believe that the God of traditional Western theology (if he existed) would make available to us clear evidence of his existence, we would be entitled to adopt atheism once it had been shown that the reasons given in support of theism are inadequate. But it has been argued that if God made it altogether clear that he exists we would not be cognitively free in relation to him - that is, we would not be independent autonomous persons free to make our way in the world with or without God. Since it is difficult to know that this is not so, and difficult to know that God's purpose for us would not involve our being cognitively free in relation to him, we cannot be confident that the absence of sufficient reasons to believe in God warrants disbelief in God rather than suspension of belief. Thus the justification of atheism requires reasons in support of atheism as well as refutation of purported sufficient reasons in support of theism.

One popular argument for theism relies on the claim that belief in some sort of deity is universal among humans. What better explanation of this fact than that theism is true and God has implanted some recognition of himself, however poorly grasped, in the peoples of the world? Against this argument there are two decisive objections. First, if the argument supports anything, it more directly supports polytheism than theism, for the peoples of the world tend to believe in many distinct deities rather than the single supernatural, perfectly good, all-powerful, all-knowing being of traditional theism. Second, there are plausible naturalistic explanations of the near universal belief in some deity or other. For example, it has been argued that before our ancestors gained any significant

control over nature - or at least an understanding of its workings - they personified the forces of nature, made gods of them, and thus sought to control nature by praying to the gods. Such naturalistic explanations of the near universal belief in gods add to the implausibility of using this belief as support for the existence of the theistic god. In addition to such popular arguments, there are the more serious arguments advanced by philosophers and theologians. The most important of these are the argument from the idea of God, the argument from the existence of the world, the argument from the existence of a world supportive of life and consciousness, the argument from objective moral values and the argument from religious experience.

The argument from the idea of God as a being exhibiting every perfection in the highest possible degree (the ontological argument) has been found wanting by most philosophers. In its place, a modal version has been advanced that rests on the premise that it is logically possible that a being having all perfections in the highest degree exists in every possible world. But if it is logically possible that there is at least one possible world in which every being has some minor defect, the premise of the modal version is false. So although the argument is valid, there is no good reason to think it is sound.

The argument from the existence of the world (the cosmological argument) reasons that the world is contingent; it either might or might not have existed. Since whatever exists but might not have existed must owe its existence to some being that brought it into existence, the world owes its existence to a being that produced it. If the being who produced the world were itself contingent, then it would be part of the world and could not be the cause of the world. Therefore, the being who produced the world does not owe its existence to anything else; it exists necessarily. This argument faces two difficulties. First, if it is correct, it establishes only a necessary cause of the contingent world. It does not establish that the necessary cause of the world has the properties definitive of the theistic God. Attempts to carry out this further task have not been particularly successful. Second, the argument rests on a rather strong but unsubstantiated causal principle: every contingent thing (or collection of such things) has a cause of its existence.

The argument from the existence of a world supportive of life and consciousness is the successor to an earlier argument from apparent design in plants and animals (the design argument), an argument that has been seriously weakened, if not damaged beyond repair, by the naturalistic explanation based on Darwin’s theory of evolution through natural selection. According to the new argument, we know that a universe with initial conditions and laws permitting the emergence of life and consciousness is only one of vastly many ways the universe might have been. Had it been slightly different in any one of ever so many ways, life and consciousness would not have been possible. For example, had the rate of expansion after the Big Bang been slightly slower or slightly faster, life could not have occurred. Thus, it is extremely improbable that life should have emerged, given the vast number of alternative ways things could have gone. Of course, the initial conditions and order necessary for the emergence of life could have occurred randomly, but on the hypothesis of theism it is much more likely that these conditions and this order would occur. So, given that they have occurred, theism is more likely than any purely naturalistic account. This argument has merit provided we assume that our universe is a one-time affair. But if the present universe is only one of vastly many universes that have emerged and disappeared, it would not be so improbable that at least one such universe should contain the initial conditions and laws permitting the emergence of life and consciousness. And that it is our universe that contains these conditions and laws is, of course, not unlikely at all. For if it did not, we would not be here to ask why it does (see Religion and science §6).

The moral argument is generally presented in three steps. First, it is argued that there are objective moral truths. By this it is meant that independent of what we may feel or think, some acts just are morally wrong, others morally right (see Moral realism). Second, it is argued that these moral truths about right and wrong depend on an ultimate superhuman moral lawgiver who establishes these truths. Finally, it is argued that without some being who brings it about that human happiness is proportioned to our obedience to the demands of morality, we would lack sufficient incentive to be moral (see Religion, history of philosophy of §5). While this argument has always had some appeal, it has been severely criticized. It is argued that even the will of an omnipotent, perfectly good being cannot be the ultimate source of morality. For something is not morally right because an omnipotent, perfectly good being commands it; rather such a being would command it because it is morally right. Also, it is argued that there is no inconsistency in happiness being disproportionate to the moral life. For all we know, morality may be its own reward.

The argument from religious experience rests on the principle that if a person has an experience that seems to be of a particular object, they are justified in thinking that the object exists unless there is some reason for thinking otherwise. The application of this principle to experiences that seem to be of God gives grounds for thinking that God exists (see Swinburne 1979). Against this argument we should note three points. First, we know in advance roughly what an object such as a dog or a cat would look like were we to have a perception of it. Few people have any idea how the theistic God would appear if they were to perceive him. Second, in the case of physical objects we have some reasonably clear idea of how to discover reasons for thinking our perceptual experience was not a genuine perception of a physical object. Examples of such reasons might be finding that others who were in a position to see or hear it report seeing or hearing nothing, or determining that the supposed object is of a sort (a fire-breathing dragon, for instance) that we have good reason to think does not exist. Because we are not in such a position with regard to the supposed object of religious experience, the fact that it is difficult to discover reasons for thinking such experiences are not genuine perceptions provides little or no reason to think they are genuine. Third, religious experience seems incapable of establishing that the object of the experience has some of the properties (being creator of the world, being infinitely powerful, being eternal, and so on) essential to the God of traditional theism. Thus, many philosophers believe that the argument from religious experience provides little support for the view that the God of traditional theism exists (see Religious experience).

It is generally conceded that none of these arguments constitutes a proof of the existence of the God of traditional theism. Nor does any one of them appear to make the existence of this being so probable as to warrant belief. Some philosophers contend that considered together they provide sufficient grounds to warrant belief in theism. But critics insist that even this judgment is too strong. Some critics suggest that at best the arguments make it likely that some sort of divine intelligence had something to do with the ordering of the universe, but point out that this is a far cry from having grounds to believe that there is an omnipotent, omniscient, perfectly good creator. They claim that unless we have something else to go on we simply lack sufficient reason to believe in the God of traditional Western theology.

4 Justification of atheism: disproving the existence of God

What of the other side? Are there reasons to think that this being does not exist? Supporters of atheism typically focus on two issues: conceptual difficulties in the perfections ascribed to the God of traditional theism, and the problem of evil. With respect to the former, there are serious difficulties in formulating adequate accounts of omniscience and omnipotence. There are also formidable arguments to the effect that divine omniscience is inconsistent with immutability (an attribute long considered essential to the theistic God), and that God's essential moral perfection is incompatible with any significant divine freedom with respect to whether to create and what world to create (see Omniscience §2; Freedom, divine). Finally, there is the general problem of whether those divine perfections that vary in degrees (knowledge, power, goodness) have an upper limit. But while these difficulties raise genuine doubts as to whether the traditional theistic conception of God is coherent, many philosophers believe that they fall short of a proof of incoherence.

The fundamental issue in the problem of evil is this. Do we have good reason to think that evils occur in the world that an omnipotent, omniscient and perfectly good being would not be justified in permitting? In so far as we do have good reason to believe this, we have a good reason to believe that atheism is true. When we consider horrendous evils or the sheer magnitude of human and animal suffering, the idea that an omnipotent, omniscient, perfectly good being is in control of the world may strike us as absolutely astonishing, something almost beyond belief (see Rowe 1979). What could possibly justify his permitting such monstrous evils? Theists generally accept the view that there must be some good or goods whose realization justifies his permission of these monstrous evils. Some theists propose theodicies that purport to tell us what these goods may be. Other theists say that we do not understand what these goods might be and, furthermore, we should not expect to understand. After all, God's mind is infinite and the goods in question are likely to be very complex and thus beyond our comprehension. Critics respond that God could at least make his presence known and provide some direct assurance, for example, to the mother whose child has been raped, tortured and brutally murdered, assuring her that all this serves some good purpose. Would that not go some way towards comforting the mother in her suffering? Yes, some theists reply, but the mother's sense of the absence or silence of God is just one more evil that God permits in order to realize some justifying goods. But what are these goods and why must God permit such evils in order to realize them? After all, he is omnipotent. Theists reply that with our finite minds we should not expect to understand.

Although the proponent of the argument from evil may be able to show that it is quite likely, if not certain, that no goods we know of justify God in permitting all these horrendous evils, no one can provide a proof that there are no goods realizable in some future state of the world - an afterlife - that would be sufficient to justify the theistic God in permitting the monstrous evils that occur in this life. But the proponent of the argument from evil does argue that it is rational to believe that there are no such goods as these. Indeed, the atheist typically thinks that the argument from evil is of sufficient strength to justify belief in atheism (in the narrow sense) provided the case for theism is itself inadequate. But few theists share this judgment.

Atomism, ancient

Ancient Greek atomism, starting with Leucippus and Democritus in the fifth century BC*, arose as a response to problems of the continuum raised by Eleatic philosophers. In time a distinction emerged, especially in Epicurean atomism (early third century* BC*), between physically indivisible particles called 'atoms' and absolutely indivisible or 'partless' magnitudes.*

The term 'atom' (*atomon*), literally 'uncuttable', was coined in the fifth century BC by the first atomists, Leucippus and Democritus (§2). As the name suggests, its primary sense is an unbreakable particle, and their theory was certainly a physical one about the ultimate constituents of phenomenal bodies. Later theorists, in the late fourth century BC and after, sometimes spoke of 'partless' or 'minimal' magnitudes or bodies, terms which focus more on the mathematical aspects of the entities in question. The Platonist Xenocrates (§2) and the Dialectician Diodorus Cronus (§2) developed such theories, although it is unclear whether, and if so how far, these were also applied to the problems of physics. In the early third century BC, Epicureanism (§§2-3) combined the physical and mathematical approaches, positing atomic physical particles which were themselves further analysable into absolute 'conceived as altogether', irreducibly small magnitudes.

Despite the above crude distinction between physical and mathematical indivisiblity, it is unlikely that the two concepts were originally distinct. The origins of atomism lay in the conceptual arguments of the Eleatic philosophers. Parmenides (§5) had argued that that-which-is is indivisible because it is 'all alike'. Some took this to mean that if a thing were divisible anywhere it would have to be divisible everywhere; hence it would consist of infinitely many parts of zero size, making the whole either infinitely large or sizeless. Zeno's puzzles about plurality and motion (Zeno of Elea §§4-6) were thought to raise similar problems. The atomist solution was that body is divisible in some places but not others: divisible in the void interstices between portions of body, but nowhere else. This is a metaphysical and mathematical thesis, but the resultant discrete portions of body easily became the basic particles of physics. Atoms, although themselves unchangeable, were held to come in varying shapes and sizes. By the motion of infinitely many of them in an infinite void, worlds and all their contents could be formed.

The emergence, especially with Diodorus and Epicurus, of a thesis of mathematical or absolute minima may reflect the feeling that atoms of varying shapes and sizes could not adequately answer the Eleatic puzzles. Such atoms must have parts, and, whether or not they could be physically fragmented into them, the same problems about measuring and counting the parts threatened to recur. Hence minima were conceived as altogether partless portions of body, and the same concept spread to the analysis of time and space. Thus all magnitudes came to be seen as granular in structure.

Opponents, whether sceptics (like Sextus Empiricus) or champions of the continuum (including Aristotle and the Stoics), could point out many conceptual difficulties, although whether these outnumbered the paradoxes of the continuum is debatable. Perhaps the toughest was: what would happen to two bodies approaching each other at equal speed across a distance consisting of an odd number of minima?

Ancient physical atomism won numerous adherents in the Renaissance and among early modern philosophers and scientists. Its most powerful exponent, Gassendi (§§2, 4), studied his Epicurean sources minutely. From him an unbroken line of influence runs to modern atomic physics.

Atonement

As a theological concept, atonement articulates the acts by which relations between God and creatures, disrupted by human offence, can be restored. Although other cultures show an awareness of the need for atonement, the Christian tradition understands it as provided by God's particular historical action in Jesus Christ. At its centre is the notion of reconciliation between God and his alienated creatures, which is achieved particularly by the death of Jesus. The distinctive philosophical and other problems of atonement theology derive from two features in particular: its claiming of universal significance for the historical life and death of Jesus of Nazareth (the problem of universality); and the moral difficulties, especially in the realm of human freedom and responsibility, which arise from the claim that he is the vehicle of atonement with God (the problem of human autonomy).

Although there were many theologies of atonement before Anselm of Canterbury's, his systematic treatment is the fountainhead of much modern discussion, both Roman Catholic and Protestant. Centring on the concept of satisfaction, it understands Christ as the God-man, satisfying both divine justice and human need by a free gift of his life. Criticisms of the formulation have centred on its understanding of sin and its tendency to understand atonement in external, transactional terms. Subsequent discussion of the concept has also raised questions about Christ's substitutionary and representative roles and about the relation between the justice and the love of God. A significant proportion of modern thinkers have rejected the need for any concept of atonement at all. They have preferred instead to understand Jesus as an example to be followed ('exemplarism') or to concentrate upon the effect his behaviour and example have on the believer ('subjectivism') - or to adopt a combination of both.

1 Atonement as moral necessity

The word 'atonement' is a Christian theological coinage, supposedly the only one made by an English theologian ('at-one-ment'). Along with many of the words found in its conceptual field - such as 'sacrifice' - its everyday uses are wide and general. Thus criminals are sometimes said to suffer punishment 'to atone' for their crime. This entry, however, will focus on the technical sense of the term, which applies primarily to relations between moral agents and the God to whom they are conceived to be responsible. In atonement theology, God is supposed to be in varying ways the active agent and passive recipient of atoning action. Most of the conceptual complications surrounding the topic derive from the various ways of construing this relation.

The concept of atonement, though developed in the Christian theological tradition in a number of related ways, is arguably of much broader provenance with respect to the moral and theological realities with which it purports to deal. Its underlying insight is that moral offences bring about an objective disruption of patterns of interpersonal life - indeed, in some accounts, of universal order also - of such a kind that some form of reparation or restoration is necessary if the resulting imbalance is to be corrected. To atone for one's offence is to act in such a way that the imbalance is corrected or reparation made to the offended. The specifically Christian understanding is that the impact of cumulative human offence is such that atonement must in some way be provided by God himself, the agents of moral offence having been rendered impotent by the weight of evil. Much ensuing discussion, particularly philosophical discussion, is centred on whether this can be conceived to take place without some violation of moral reality or human autonomy.

Classical Greek sources show that a need for atonement for wrong done is evidenced in cultures not directly affected by biblical categories. In Presocratic philosophy (Empedocles (§2), for instance) and Athenian drama there is a clear sense that moral agents are so bound up with both social and universal order that offence requires some form of atoning or purifying action. The Oedipus cycle makes clear the relation between moral impurity - particularly that deriving from the spilling of blood - and social disorder. The anthropologist René Girard (1977) has demonstrated the essentially rational way in which primitive religion understands and deals with violence as socially disruptive. Of particular importance for an understanding of substitutionary or vicarious aspects of atonement thought is his treatment of the fact that purificatory or avenging violence is often inflicted on someone or something other than the offender in order to break a cycle of revenge. Girard's is important evidence for the claim that matters of universal import underlie the particular forms of atonement theory in the Western Christian tradition.

In the Bible it is possible to discern a generally fourfold matrix within which atonement is understood. The moral

offence which must be atoned for takes place in a network of relations between God, the offender, society and the cosmic order. Despite a range of interpretations of the opening chapters of Genesis the general pattern is clear. The disruption of a due relation to God (Genesis 3) has consequences for both social order (for example, the story of Cain and Abel) and the human relation to nature (Genesis 3: 17-19). It is for the sake of a restored social order based on a renewed relation to God that the cultic and legal order of Israel, with its inextricably related atoning and juridical institutions, is described in succeeding books. It is in the light of such considerations that the New Testament and later theological discussion of the death of Jesus and its atoning significance should be understood.

2 The Bible and the Fathers

The New Testament, drawing as it does on a world of imagery deriving from the Old Testament as well as on non-biblical sources from the surrounding culture, contains the bases of the later, more systematically articulated theologies of atonement. Different writers centre their thought on the development of particular families of metaphor without drawing on one exclusively. St Paul developed metaphors derived from the law in expounding the atoning significance of Jesus of Nazareth. In the Letter to the Romans, his development of the theology of justification expounds the claim that the death and resurrection of Jesus are the way by which God is able to forgive and renew while remaining true to moral reality. It is noteworthy, however, that at a crucial stage of his argument he draws also on the imagery of the altar. The Authorized Version of the Bible controversially translates his word describing the atoning work of Jesus Christ as ‘propitiation’; later translations, fearing suggestions of substitutionary placation of an angry deity, tend to prefer ‘expiation’, implying more neutrally a means of taking away fault or pollution. All versions, however, draw on metaphors from the altar of sacrifice.

The author of the Letter to the Hebrews develops a theology of atonement drawing largely on such imagery. According to him, the eternal Son of God become man is at once human priest and victim, who perfects and replaces the Old Testament institutions of animal sacrifice. The author takes seriously the (atoning) purpose of those replaced institutions, and, while expounding the moral inadequacy of animal sacrifice (a view anticipated in the Old Testament prophets), theologizes the doctrine by centring atonement on the representative human achievement of the saviour. The effect of this metaphorical transformation of the language of the cult was recognized by later Christian writers who argued that Christ’s death as a universal sacrifice renders all animal sacrifice obsolete. The Johannine tradition likewise assimilates various aspects of the sacrificial tradition to Jesus (‘the lamb of God who takes away the sin of the world’ (John 1: 29)), but also fuses it with the military language of victory (see particularly Revelation 5).

For the purposes of this entry, the military imagery will be left to one side because the characteristic philosophical problems associated with atonement theology centre on legal and sacrificial notions, particularly those of representation, substitution and the forgiveness of sins. The notion of substitution encapsulates the claim made in some theologies that Jesus suffers *in place of* the human sinner in relation to God; that of representation the claim that Jesus acts *on behalf of* either the human race or (in some traditions) those elect for whom he is said to have died.

However these are to be understood, it can be argued that the New Testament concepts, which in different ways encourage both interpretations, come together in the expression often translated as ‘reconciliation’ (*katallage* and cognates). God in Christ is primarily the active subject of this verb (2 Corinthians 5: 18-20); believers are claimed (factually) to have been reconciled to God (Romans 5: 10-), but are also urged to ‘be reconciled to God’ (2 Corinthians 5: 20). The chief reference appears to be to a past, completed divine act which both determines the status of believers (and, possibly, everyone) and requires an appropriate religious and ethical response; in the Letter to the Ephesians, this is the reconciliation in one church of the once estranged Jews and Gentiles.

While the notion of substitution has little prominence in early theology, the notion of exchange (suggested by the primary meaning of *katallage*, which in turn is deeply indebted to the Old Testament - see Isaiah 52-3) prepares the way for later discussion. The anonymous (probably second-century) *Letter to Diognetus* celebrates the matter with no suggestion of the theological and moral difficulties that are later to arise: ‘O sweetest exchange! O unfathomable work of God!…. The sinfulness of many is hidden in the Righteous One, while the righteousness of the One justifies the many that are sinners’ (9.5). The foundations of the classical doctrine of the atonement were later laid by the patristic writers, for example Athanasius, who in *On the Incarnation* (*c*.316-18) employed forensic, sacrificial and military imagery in his account of the saving significance of Jesus. But, although this is

manifestly a theology of atonement, there was little systematic articulation of the problems in the early period.

Three generalizations are useful for an understanding of the later debates. First, the early writers, and the Eastern Orthodox tradition until today, tend to speak of redemption by Christ's self-sacrifice rather than atonement, and exposition is rather in terms of a wealth of images than of a systematic working out of a theology. Second, Orthodox theology tends to speak more of an ontological change brought about in the believer as a result of the self-giving sacrifice of Christ and the life of the church than of a moral or legal reconciliation concentrating on Christ's death. Third, theology in the West until the Middle Ages was very much shaped by Gregory of Nyssa's celebrated image of redemption: on the cross, Jesus cheats the devil of his human prey, deceiving him into thinking that here is but a man. The devil swallows his victim, only to be caught on the hook of his hidden divinity. Gregory's way of speaking was the catalyst for the critique of Christian theology which drew a definitive response from Anselm of Canterbury.

3 The doctrine of satisfaction

The doctrine of satisfaction has its origins in the rather juridical conception of the human relation to God developed in the West. In the first instance, it was used of the human response to God, with few overtones of atonement theology. For Tertullian, the human calling was conceived in terms of satisfying the just demands of God, the sovereign of the moral order. The concept was adopted and developed as a metaphor to express the atoning act of the Son of God by Anselm of Canterbury (§8) in his *Cur Deus homo (Why God Became a Man)* (completed in 1098). In response to criticisms of the irrationality of Christian atonement teaching made by opponents (probably Jewish and Muslim thinkers), he rejected the then reigning theology of atonement, which was heavily influenced by Gregory of Nyssa and according to which the death of Jesus on the cross had freed humankind from the legal power of the devil. Anselm's rejection was based on a conception of the sovereignty of God whereby God has no need to bargain with one who is his own creature. His own theory attempted to establish the necessity of the atonement understood in terms of satisfaction.

The assumption underlying Anselm's argument - and it is probably a necessary assumption for Christian theologies of atonement - is a belief in universal moral order and God's responsibility for upholding it. The human breach of this moral order has led, on the one hand, to human moral incapacity to atone, because of the infinite weight of accumulated offence; on the other, it has led to a situation in which God must either punish or provide some alternative (such as satisfaction) if his purposes in creation are not to be frustrated. Anything else (for example, the mere remission of sins) would involve an offence against universal order, and so be unjust, even (or especially) for God. Punishment would consist in annihilating the human race and so would involve an abandonment of God's purposes in creation; satisfaction requires a counterbalancing act of restitution which maintains that order.

Satisfaction is provided by the gift to God the Father of the God-man's life, offered by means of his free human obedience; as the life of God it outweighs even the infinity of human offence. This notion of satisfaction provides the basis of all claims for the universal significance of the particular historical act of Jesus. Because it is the act of God in the context of universal human fallenness - at one level, a gift by God to God; at another, an act of human reparation - it is of universal significance. Recent commentators (such as Steindl), in line with a long tradition of biblical theology of salvation, have emphasized that satisfaction, as an alternative to punishment, represents not the infliction of a penalty on a human Jesus in place of the actual offenders, but a creative act whereby God, by a new initiative, overcomes evil by good.

Anselm's aim was the limited one of establishing the rationality and necessity of the God-man, so there is a measure of injustice in insisting that he should have done things that he never set out to do. But subsequent theology has criticized him for omissions as well as commissions in his treatment of the atonement. Objectors have identified the excessively legal and mathematical terms of the conception, with its transactional rather than relational or personal emphasis, and the failure of the theology to give some account of the appropriation of salvation by the believer. Both criticisms observe a tendency to see the atonement as external to the human recipient of salvation and so inadequate as an account of reconciliation, which concerns relationships.

4 After Anselm

Important variations on Anselm’s theme were produced by Thomas Aquinas and John Calvin, both of whom strengthened it where it appeared weak, but remained broadly within his tradition. Aquinas broadened the terms in which the atonement was to be understood, balancing and expanding talk of a debt paid with that of a stain erased. Some of the external features are mitigated when the legal metaphor of satisfaction is enriched with sacrificial imagery which suggests cleansing rather than remission of penalty.

Calvin’s treatment of the atonement is the fountainhead of many recent disputes. The context is Luther’s reassertion and reshaping of the Pauline and Augustinian doctrine of justification by faith in terms of personal and relational categories (see Justification, religious §4; Luther, M.). Justification for Calvin is a metaphor of legality and therefore still within the Anselmian penumbra, but because his account centres on the subjective appropriation of the act of atonement by God in Christ, it helps to obviate the externalism of the Anselmian view. He buttressed his teaching of justification ‘by faith through grace’ with a theology of the objective atoning act of Christ. This act derives from the love of God (a note strangely absent from Anselm, who prefers to speak of God’s mercy). The wrath from which it saves us is, according to Calvin, the necessary means by which we are made aware of our need for salvation. Christ saves us by both a propitiatory sacrifice, which Calvin understands similarly to Anselm, and by a representative obedience. Another central aspect of Calvin’s teaching is the *participation* of the believer in the achievement of Christ, another blow against externalism (see Calvin, J. §4).

Differences over justification led to a parting of the ways between the two main streams of Western Christianity. Over against the Reformers, with their teaching of the complete forgiveness of sin, the sixteenth-century Council of Trent, building on Anselm and Aquinas in a very different way, stressed the merit earned by Christ on the cross and communicable to believers especially through the mass. The Roman Catholic church taught until recent times that sinners must continue to atone for their sins in this world and after death in purgatory (see Purgatory). In the teaching of the Second Vatican Council, juridical conceptions have given way to the view that by the death and resurrection of Jesus, God overcame evil and made humanity a new creation. However, because the chief intellectual battles since the Reformation have been between the orthodox and liberal wings of Protestantism, we shall concentrate on these developments.

Although Calvin did not say, any more than Anselm, that Jesus is punished instead of us, some of his successors were less careful in their expression of the doctrine. The neglect of his participatory language had two important consequences. First, the doctrine was again taken as teaching some external ‘transaction’, sometimes construed as a ‘penal substitution’ in which Christ was seen as suffering an equivalent penalty to that to which the guilty were liable. Second, and more important for the later history of the doctrine, it became liable to criticisms of varying degrees of severity.

On the one hand are the more radical critiques based on doctrines of moral autonomy. The source of this approach is the medieval philosopher Peter Abelard. While there is disagreement about the interpretation of his theology, it appears to make its chief appeal not to the reconciliation of those who are in some way at odds, but to a definitive act in which God shows his love to sinners. Those successors of Abelard who move in the direction of theories that are called subjective (because they deny an objective reconciling act) or exemplarist (because they see the work of Christ as essentially an example to be followed) can scarcely be said to produce theologies of atonement at all, because they have no place for a historic act of reconciliation of opposed or estranged parties. Their arguments are of interest here for their objections to forms of atonement theology proper.

The Socinians, the first influential opponents of a theology of atonement, taught the non-transferability of penalty and a strongly individualist conception of moral responsibility, and thus provide the strongest possible challenge to traditional conceptions (see Socinianism §§2-3). Their approach has its paradigmatic modern treatment in Kant’s *Religion within the Limits of Reason Alone* (1793) (see Kant, I. §11). Kant accepts two features of the orthodox teaching: a doctrine of the fallenness of the human race (‘radical evil’), and the requirement for some form of atonement. But the atonement cannot be anything other than a kind of individual philosophical and inner conversion. In describing this conversion, Kant uses all kinds of traditional atonement language, but transfers its reference from the historical cross to the individual’s soul.

On the other hand, the doctrine of atonement has been revised from within by a number of theologians who wished to remain true to its insight that Jesus Christ, and particularly his cross, is definitive for human salvation. Their criticism centred on the doctrine of a limited atonement taught by some Calvinists, that Christ died only for the

elect. Many have held this limitation on the universality of atonement to be inconsistent with the justice of God. Influential in the development of more universal theologies was John McLeod Campbell. Early in the twentieth century, the Scottish Congregationalist P.T. Forsyth, while accepting aspects of liberal criticism, yet felt it necessary to stress the holiness of God, in the light of which conception he argued for the need for the historic act of God in the substitutionary cross of Jesus. Similarly, Karl Barth (§§2-3) attempted to combine the elements of truth in substitutionary and representative theologies, while seeing the atonement as the historical outworking of God's universal electing and covenant love.

5 Theological and philosophical theses

Substitution and representation. There is a strong case for holding that Christian atonement theology requires some element of substitution if it is to give an adequate account of the teaching that human fallenness required the death of the saviour who on the cross took our place before God. Biblical teaching is, however, unanimous that there is no breach between the actions of God the Father and God the Son. The Son dies as a result of the love of God the Father, even though he also undergoes the effects of divine judgment on human sin. Here a distinction should be drawn between substitutionary atonement and substitutionary punishment. One cannot be punished for the offences of others, but one can make substitutionary atonement for them by taking their place in a transformative act of love. On this account, the Son of God, as representative of the human race, freely enters that relation to God which is the universal fate of those who reject God's love. His death is not so much a punishment as a sharing of the *relationlessness* which is the just fate of those who would deny their nature as existing in relation to God and others.

Justice and love. The classical Pauline view of the cross is that it expresses at once the love and justice of God. The cross and resurrection of Jesus show that he is at once just and justifies. That is to say, the reconstitution of human life by means of atonement establishes rather than undermines morality. Christian theology's claim is that God himself has provided the solution to the problem of moral evil by himself bearing its consequences, as a way of overcoming evil with good. This has encountered opposite objections from left and right: that God should be able to forgive simply by an exercise of power, and that morality is undermined by forgiveness. But the first objection fails to uphold the reality of the moral law, while the second ignores the transformative effects of atonement, the overcoming of evil by good.

Moral responsibility. A conception of atonement of this kind also requires a relational view of humanity. While I am responsible for my sins, what I am is also inextricable from my relation to God and to others. Modern objections, particularly those expressed in Kantian theories of autonomy, mistake the human condition in two important respects. They are individualist, and they assume a false or non-theological conception of human freedom. The participatory dimensions of atonement theology show that by participating in the (representative) achievement of Christ - particularly in those sacraments constitutive of the new community of forgiveness (baptism and the Lord's Supper) - the believer shares a form of community within which reconciled forms of life are realized.

The particular and the universal. As we have seen, Anselm's concept of universality derived from a particular conception of the divine act in Christ. Any attempt to show that a particular historical event or person is of universal moment depends on two features: its determination in divine intention to be what it is, and its answering to the needs of the human condition, particularly fallenness. If the human race does not have within itself the capacity for moral regeneration, there is a case for arguing that it is to be found in the reconstitutive acts of the life, death and resurrection of Jesus.

Augustine (AD 354-430)

Augustine was the first of the great Christian philosophers. For well over eight centuries following his death, in fact until the ascendancy of Thomas Aquinas at the end of the thirteenth century, he was also the single most influential Christian philosopher. As a theologian and Church Father, Augustine was the person who did the most to define Christian heresy and so, by implication, to formulate Christian orthodoxy. Of the three most prominent heresies defined by Augustine - Donatism, Pelagianism and Manicheism - the latter two also have especially important philosophical implications. In rejecting Pelagianism and its thesis of human perfectibility, Augustine rejected one form of the principle, often associated with Kant, that 'ought' implies 'can', and in rejecting Manicheism, with its doctrine that good and evil are equally basic metaphysical realities, Augustine rejected one solution to the philosophical problem of evil.

The Categories may have been the only work of Aristotle that Augustine actually read. Plato he knew somewhat better. He seems to have been familiar with several Platonic dialogues and he clearly felt a special affinity for Plato and the Platonists, which is particularly evident in De civitate Dei (The City of God) and De vera religione (On True Religion). Although he could be said to have responded to classical Greek philosophy in consequential ways, it must be added that what he responded to had been filtered through Neoplatonism, Hellenistic scepticism and Stoicism. It was principally through the writings of Cicero that Augustine became schooled in the opinions of his philosophical predecessors, and it was through the works of the Neoplatonists that he developed his deep appreciation for Plato.

Augustine's philosophy thus draws significantly on the philosophy of late antiquity as well as on Christian revelation. Its originality lies partly in its synthesis of Greek and Christian thought, and partly in its development of a novel ego-centred approach to philosophy that anticipates modern thought, especially as exemplified in the philosophy of Descartes. In his De trinitate (The Trinity) and De civitate Dei, Augustine presents a line of thinking that foreshadows Descartes' famous cogito, ergo sum. *Through his Confessionum libri tredecim (*Confessions, *more usually known as Confessiones), the first significant autobiography in Western literature, and also through his Soliloquia (Soliloquies), which is a dialogue between himself and Reason, Augustine introduced a first-person perspective to Western philosophy.*

Early in his career, Augustine found himself attracted to philosophical scepticism. In his earliest extant work he offers his most extensive response to the main sceptical arguments of his day, including those that raise the possibility one might only be dreaming. His later responses to scepticism, though less extensive, are better focused; they concentrate on the self-knowledge he considers directly available to each knowing subject, including the knowledge that one exists. Taking the first-person perspective one can also develop, he tries to show, in his De trinitate, a convincing argument for mind-body dualism. But supposing, as he does, that each of us knows from our own case what a mind is raises, as Augustine is perhaps the first philosopher to realize, a problem about how one can ever know that there are minds in addition to one's own.

Augustine's account of language and meaning influenced the development of 'terminist' logic in the high middle ages. His thoughts on language acquisition in Confessiones provide a foil for Wittgenstein in the latter's Philosophical Investigations. Yet, some of Augustine's own reflections on ostensive definition in his dialogue De magistro (The Teacher) anticipate Wittgenstein's own views on language learning.

Augustine develops what is described as an 'active' theory of sense perception, according to which rays of vision touch objects whose consequent action on the body is 'noticed' by the mind or soul. Although his ideas on sense perception are interesting, his most influential epistemological conception is certainly his 'theory of illumination'. Instead of supposing that what we know can be abstracted from sensible particulars that instantiate such knowledge, he insists that our mind is so constituted as to see 'intelligible realities' directly by an inner illumination.

The modern concept of the will is often said to originate with Augustine. Certainly the idea of will is central to his philosophy of mind, as well as to his account of sin and the origin of evil. Strikingly, he uses psychological 'trinities', including the trinity of memory, understanding and will, to illuminate the doctrine of the Divine Trinity, where there is also a baffling unity in plurality. The theological warrant for this analogy Augustine finds in the

biblical idea that God created human beings, and specifically the human mind, in his own image.

Augustine's attempts to achieve a philosophical understanding of theology and religious belief set the framework for much later medieval and early modern philosophy. On the issue of how reason should bear on religious faith, Augustine develops the idea that reason should work out an understanding of what we must first accept on faith. Yet he also displays a keen sensitivity to those issues most likely to challenge one's religious faith. Prominent among his concerns is the philosophical problem of evil, to which he offers what has proved to be perhaps the most influential type of solution.

Particularly striking is Augustine's virtually lifelong preoccupation with human freedom and how the fact that human beings are free to make their own choices can be reconciled with the Christian doctrines of God's foreknowledge, predestination and grace. Almost every important medieval philosopher in the Christian West would later contribute to the continuing effort to achieve a satisfactory reconciliation of these issues. It is significant that Leibniz, who gave the problem of freedom, foreknowledge, predestination and grace one of its most sophisticated treatments, also gave much of his philosophical attention to the equally Augustinian problem of evil.

Although Augustine did present an argument for the existence of God, it is his understanding of the divine attributes, and especially his insistence on divine 'simplicity', that is, on the idea that God is not distinct from his attributes, that has been especially influential on later thinkers. Also influential are his various attempts to understand the created world. Augustine made several important efforts, perhaps most notably in the last books of his Confessiones and in his De genesi ad litteram (The Literal Meaning of Genesis) to give a philosophically sophisticated account of the creation story in the biblical book of Genesis. His contrast between God's eternity and human temporality set the stage for later medieval and modern discussions of these issues, and his discussion of the nature of time in Book XI of his Confessiones is sometimes taken to epitomize philosophy.

Augustine's descriptions of mystical experience are among the most eloquent in Western literature; they belong among the classic texts of mysticism. However, Augustine's attempts to understand ritual are perhaps more remarkable for the directness with which he identifies and confronts difficult issues than for the success of his efforts to solve them. Those efforts seem to be hobbled by his version of mind-body dualism.

Augustine is a thoroughgoing intentionalist in ethics. This feature of his thought, as well as his unflinching insistence that one can do what one knows one ought not to be doing, mark him off from ethicists of the classical Greek period. Yet Augustine also preserves in his own thinking important strands of ancient Greek thought. Thus, for example, his development of the doctrine of the Christian virtues includes an echo of Plato's idea of the unity of the virtues. His insistence that 'ought' does not, in any straightforward way, imply 'can', distinguishes him, not only from his contemporary Pelagius, whom he helped brand as a Christian heretic, but also from most modern ethicists as well.

The philosophy of history Augustine develops in De civitate Dei initiates a branch of philosophy that came into full flower in the nineteenth century. Also in that same work Augustine makes an influential contribution to what has come to be called 'just war theory', an applied ethical theory that has continued to develop even into the latter half of the twentieth century.

1 Life

Augustine was born Aurelius Augustinus, in the North African town of Tagaste (modern Souk Ahras in eastern Algeria), in the Roman Province of Numidia in the waning years of the Roman Empire. Except for a five-year stay in Italy, he spent his entire life in North Africa. Ordained a priest in AD 391 and made a bishop four years later, he lived out the remaining thirty-five years of his life, first as a coadjutor and then as the diocesan Bishop of Hippo (later Bône, now Annaba, Algeria), which was at the time the second most important port city in Africa.

Augustine's mother, Monica, was a devout Christian; his father, Patricius, a man of modest means, was not given a Christian baptism until he was on his death bed. Augustine received a classical education, first in the local grammar school, then in a higher school in nearby Madaura and finally, under the patronage of a local nobleman named Romanianus, at the university in Carthage. It was in Carthage as a student of rhetoric that he read Cicero's now lost dialogue, *Hortensius*, which, as he later wrote in *Confessionum libri tredecim* (Confessions, more usually

known as *Confessiones*) altered his sensibility and brought him under the spell of philosophy.

After a brief period as a teacher of rhetoric in his home town, Augustine returned to Carthage and then, in AD 383, sailed for Rome. The five years he spent in Italy included a period as professor of rhetoric at Milan. Also in Milan, Augustine joined a circle of Neoplatonists and turned away from the Manicheism he had embraced in Carthage. In Book VII of *Confessiones* he explains how profoundly the Neoplatonic works he read in that Milanese circle helped him think about the nature of God and the problem of evil.

It was also in Milan, after he had immersed himself in Neoplatonism, that Augustine finally became a Christian convert, under the tutelage of Ambrose, Bishop of Milan, and through the continuing influence of his mother, who had followed him to Milan. The year before his baptism in AD 387 Augustine withdrew with several philosophically-minded relatives and associates to a villa at Cassiciacum, perhaps near Lake Como, where he wrote four of his earliest works, including an extremely interesting dialogue critical of the scepticism of the New Academy, *Contra academicos (Against the Academicians)*, as well as the *Soliloquia (Soliloquies)*.

Shortly after Augustine's baptism, his mother died. Following a brief stay in Rome, Augustine returned to Carthage in AD 388 and never left North Africa again. When he became first a priest and then a bishop, he sought to combine his pastoral duties with extensive excursions into philosophy and theology. It was in response to the spread of Donatism, Pelagianism and Manicheism in North Africa that Augustine wrote great treatises to expose those trends as heretical (see Manicheism; Pelagianism). It was in further response to the decline and fall of the Roman Empire, blamed by critics of Christianity on the Christianization of Rome, that Augustine wrote *De civitate Dei*. Rome had already been sacked in AD 410; Hippo itself was under siege as Augustine died twenty years later.

Augustine's literary output, produced with the help of scribes, is enormous. Chadwick (1986) claims that what survives of his work is the largest body of writing left by any ancient author. In addition to approximately one hundred books and treatises there are some two hundred letters and over five hundred sermons. Three years before his death, Augustine went through all his works and listed and commented on them in a great compendium, the *Retractationes*, or reviews. In some cases he retracts claims made in the works he reviews, or expresses regret at having made them. However, most of what he had written he lets stand. On the basis of these reviews, we may conclude that at least 90 per cent of Augustine's writings have survived.

After Augustine became a priest in AD 391, he wrote no single work that could be said to be entirely philosophical. On the other hand, hardly anything he wrote at any time in his life was entirely devoid of philosophy. Philosophical reflections, analyses and explorations turn up, often quite unexpectedly, in his sermons and letters and, of course, in the great theological, exegetical and doctrinal treatises. By the time Augustine came to write *De civitate Dei*, his lingering admiration for the grand ambitions of speculative philosophy and natural theology had become tempered with an acute awareness of how the human mind on its own is too crippled by old vices to be able to 'enjoy and abide in the changeless light' (*De civitate Dei* XI.2). Be that as it may, the philosophical light in his own eye burned brightly until the very end of his long and singularly productive life.

2 Scepticism

In Rome at the beginning of his stay in Italy Augustine grew increasingly dissatisfied with Manicheism, to which he had provisionally given his allegiance in Carthage. He found himself attracted to the sceptical viewpoint of the Academics, the followers of Arcesilaus and the New Academy, who 'held that everything was a matter of doubt and asserted that we can know nothing for certain' (*Confessiones* V.10.19). Augustine seems to have learned of ancient scepticism, and of the debate between Arcesilaus and the stoic Zeno of Citium from Cicero's *Academica* (see Cicero).

Augustine's most extensive discussion of scepticism is to be found in his earliest surviving work, the dialogue *Contra academicos*, written at Cassiciacum just months before his baptism. The Academics, according to him, base their claim that nothing can be known on the application of a strict criterion for knowledge put forward by Zeno. Although Augustine formulates Zeno's criterion in several ways and it is difficult to be certain exactly how he wants it to be understood, the point seems to be that, according to this criterion, something can be known just in case it cannot even seem to be false. Indubitability would then be both necessary and sufficient for knowledge. Against accepting such a criterion, Augustine proposes a dilemma: either the criterion is known to be true, or it is not. If it is known to be true, then the sceptics are wrong, since something is known. If it is not known to be true,

then the sceptics have given us no adequate reason to become sceptics.

Augustine is not satisfied, however, with merely demonstrating the self-defeating character of the Academic position; he goes on to offer sample knowledge claims that he dares the sceptic to challenge. These sample claims fall naturally into three groups: *logical truths* (for example, 'There is one world or there is not'), *mathematical truths* (for example, 'Three times three is nine'), and *reports of immediate experiences* (for example, 'That tastes pleasant to me'). Of special interest is Augustine's response to the sceptical challenge, 'How do you know that this world exists if the senses are deceptive?' (*Contra academicos* III.11.24). Augustine answers: 'I call this entire thing, whatever it is, which surrounds and nourishes us, this object, I say, which appears before my eyes and which I perceive is made up of earth and sky, or what appears to be earth and sky, the world.' His idea is that, even if he is asleep and dreaming, he can know that 'the world' exists in the stipulated sense that there is for him at least a phenomenal world.

Although Augustine never goes on, in the fashion of Descartes (§9) to offer an argument for the existence of a world that is independent of him and his sense-impressions - what came later to be called 'the external world' - he does at least entertain the thought that there might not be such a world. As we know from later philosophy, that supposition is of great philosophical moment. Furthermore, his idea of an apparent world that fills our phenomenal space, whether or not there is an independent external world that resembles it, suggests a very Cartesian concept of mind.

Augustine never again devoted a whole treatise to the refutation of scepticism, but he did respond, again and again, to the challenge of Academic scepticism. Among the most interesting of these anti-sceptical passages are two in which he presents reasoning remarkably like Descartes' *cogito, ergo sum*:

> In respect of those truths I have no fear of the arguments of the Academics. They say, 'What if you are mistaken?' If I am mistaken, I am [*Si fallor, sum*]. Whoever does not exist cannot be mistaken; therefore I exist, if I am mistaken. Because, then, I exist if I am mistaken, how am I mistaken in thinking that I exist, when it is certain to me that I am if I am mistaken?
>
> (*De civitate Dei* XI.26)

Similar reasoning is to be found in *De trinitate (On The Trinity)*, except that there Augustine defends the 'inner' knowledge by which we each know, in our own case, that we are alive. (Presumably 'alive' must be understood here not in a specifically biological sense, but rather in the sense in which we may ask if there is life after death.)

Although Augustine's way of certifying his claim to know that he exists is indeed very similar to the reasoning of Descartes, the similarities should not obscure the equally important differences. Perhaps the crucial difference is that, unlike Descartes, Augustine does not use 'I exist' as a foundation stone in a rational reconstruction of knowledge. Indeed, although there are passages in Augustine in works such as *De libero arbitrio (On Free Choice of the Will)* that suggest a foundationalist approach to knowledge, he never really offers anything that could be called a systematic reconstruction of what one can be said to know. His defence of 'I know I exist', in particular, is meant simply to defeat universal scepticism, of the sort that occupied his attention in *Contra academicos*. His idea is that, if universal scepticism can be defeated by an unassailable knowledge claim, then the Academics are not after all 'wiser than the rest' and not everything is 'a matter of doubt', as he had earlier been tempted to think.

An important weapon in the attacks of the Academic sceptics on putative knowledge claims was always the question, 'What if you are dreaming?' In a passage from Book XV of *De trinitate* that parallels the *si fallor, sum* passage from *De civitate Dei* just discussed, Augustine considers the Academic's taunt: 'Perhaps you are sleeping, and you do not know, and you see in your dreams.' Augustine replies: 'He who is certain about the knowledge of his own life does not say in it: "I know that I am awake," but "I know that I live"…. He cannot be deceived in his knowledge of this even by dreams, because both to sleep and to see in dreams belong to one who lives' (*De trinitate* XV.12.21). In *Contra academicos*, Augustine rejects in a similar way the idea that not knowing whether one is dreaming might be a threat to one's claim to know logical and mathematical truths, or truths about one's immediate experiences.

However, Augustine never questions the assumption that we are sometimes awake and having veridical sense experiences, as well as sometimes dreaming. (He asserts that he sometimes knows, while he is dreaming, that he is dreaming, but he does not explain how he can know this.) Thus Augustine seems never to have considered the

ultimate Cartesian challenge that perhaps no thought that has ever entered one's mind is any more nearly true than the illusions of one's dream: in effect, all life might be simply one's dream.

3 Philosophy of language

In Book I of *Confessiones*, Augustine presents a classic view of language acquisition through ostension: 'When [my elders] named some object, and accordingly moved towards something, I saw this and I grasped that the thing was called by the sound they uttered when they meant to point it out' (*Confessiones* I.8.13). This passage, made famous by Wittgenstein in his *Philosophical Investigations*, may seem to most readers of the work to be little more than an aside. Yet, reflections on language appear throughout Augustine's writings, and language acquisition is a special concern of a relatively early work, the dialogue *De magistro (The Teacher)*, a dialogue between Augustine and his young son Adeodatus (who died at age 16, shortly after the dialogue was written).

In *De magistro*, Augustine clearly poses the problem of the ambiguity of ostension, and indeed does so in a most memorable way. First, the issue is raised as to how one can point to the colour of a body as distinct from the body itself. Then, there are more general worries:

> Augustine: Come now, tell me; if I, knowing absolutely nothing of the meaning of the word, should ask you while you are walking what walking is, how would you teach me?
> Adeodatus: I should walk somewhat more quickly…
> Augustine: Don't you know that walking is one thing and hurrying is something else?

(*De magistro* 3.6)

This last worry is surprisingly Wittgensteinian; as is Augustine's response. Although Augustine admits there is no way to eliminate all conceivable ambiguity in ostension, an intelligent learner, he thinks, will eventually catch on.

In *De magistro*, Augustine seems to want to account for meaning solely by appeal to what terms refer to. However, he does point out that for some pairs of words, each signifies 'as much' (*tantundem*) as the other; that is, the terms are co-referential, even though they do not signify 'the same' (*idem*) in that they do not have the same meaning or sense. Thus 'word' (*verbum*) and 'name' (*nomen*) are said to be co-referential, though not identical in meaning. Here Augustine relies on blurring the distinction, made in later medieval philosophy, between the personal and the material supposition of a term, or, we might say today, between *using* a term and *mentioning* it by quoting it (see Language, medieval theories of).

The discussion in later writings such as Book XV of *De trinitate* of the 'inner word' that is in no natural language seems to be, in part at least, an attempt to allow that a sense or concept mediates between a general term in a natural language and its extension:

> For the thought formed from that thing which we know is the word which we speak in our heart, and it is neither Greek, nor Latin, nor of any other [natural] language; but when we have to bring it to the knowledge of those to whom we are speaking, then some sign is adopted by which it may be made known. And generally this is a sound, but at times also a nod; the former is exhibited to the ears, the latter to the eyes, in order that that word which we bear in our mind may also become known by bodily signs to the senses of the body.

(*De trinitate* XV.10.19)

Although the idea that thinking might be inner talking is as old as Plato's *Theaetetus*, it is to Book XV of *De trinitate* that William of Ockham, for example, makes reference in the *Summa logicae* (I.1) when he wants backing for the idea of there being a mental language, as well as spoken and written languages.

Augustine begins *De magistro* with an inquiry into the purpose of using language. His son's first suggestion, that we speak either to teach or to learn, encourages us to accept the common assumption that we use language, either mainly or solely, to pass on information. Although Augustine and his son quickly come to include singing and praying among the language activities they discuss, the dialogue never gives proper consideration in the manner of, for example, Wittgenstein or J.L. Austin, to the full range of activities that make use of language or to the variety of roles individual utterances may play in our lives. On the contrary, Augustine concludes his dialogue

with the suggestion, backed by an intriguing but somewhat elusive line of reasoning, that language only reminds us of what we already know.

Other important discussions of language are to be found in Augustine's *De doctrina Christiana (On Christian Doctrine)*, especially at the beginning of Book II, as well as in the early treatise *De dialectica (On Dialectic)* (the authenticity of which, though contested, seems now to be quite generally accepted).

4 Epistemology

Augustine is said to have an 'active' theory of sense perception. The term 'active' in this context includes the idea that in vision the eyes emit rays that touch the object of vision. This is an idea that can be found in Plato's *Timaeus*, for example, as well as in other ancient sources (see Perception; Plato). More generally, it is Augustine's contention that, although bodily sense organs undergo change during perception, perception is not something undergone by the soul. 'Perception', he writes in a famous passage, 'is something undergone by the body *per se* that is not hidden from the soul [*non latens animam*]' (*De quantitate animae* 48). The soul takes note of what the body undergoes: 'For it is not the body that perceives, but the soul through the body, which messenger, as it were, the soul uses to form in itself the very thing which is announced from the outside' (*De genesi ad litteram* XII.24.51).

In Book XII of *De genesi ad litteram*, Augustine departs altogether from commenting on the biblical book of Genesis and offers instead a somewhat independent treatise on three kinds of vision: bodily vision, spiritual vision and intellectual vision. What Augustine calls *bodily vision* is in fact sense perception; *spiritual vision* is the entertaining of mental imagery, whether in memory or imagination; and *intellectual vision* is the non-imaginal perception of universal objects, structures and truths. This work includes Augustine's most serious attempt to account for error in sense perception. It also includes one of his most beautiful descriptions of mystical vision, and in fact this work took on great significance for the discussion of mysticism in the later Middle Ages (see Mysticism, history of).

Augustine's theory of sense perception seems not to be representational in the sense of making an image or sense-datum the direct object of perception. Thus in his discussion of vision in *De trinitate*, he claims that in seeing a body, we immediately form an image of it in our sense; yet we cannot discriminate between the form of the body seen and the form of the image we produce in our sense. He offers analogies and arguments to convince his readers that sight does have an image of the body seen, as soon and as long as it is seen, an image we may retain in memory after the perception. However, he seems to consider the formation of this inner image to be part of the process of seeing the *body*, not the production of something that could properly be said to be the direct object of perception.

Augustine's account of knowing, for example, what is virtue or what is a square, is not based on the idea of abstraction, as the accounts of Aquinas and sometimes even Aristotle are said to be. Rather, he espouses what is called 'the theory of illumination'. Augustine's talk of illumination is, in part, simply the deployment of an apt and traditional metaphor, that of light. He often uses this metaphor in discussions of cognition, as in the *Soliloquia*:

> So, whoever apprehends what is transmitted in the sciences, admits without any hesitation that this is absolutely true; and it must be believed that it could not be apprehended, if it were not illuminated by another sun, as it were, of its own.
>
> (*Soliloquia* I.5)

Platonic resonances in this passage are obvious. What exactly is meant by 'illumination' in this context is, however, less immediately obvious. What is the cash value of this light metaphor? Why does Augustine insist that whatever is apprehended through the sciences could not be apprehended if it were not appropriately 'illuminated'?

Perhaps the basic idea in Augustinian illumination is a generalization of the problem of learning by ostention. No group of instances of F-ness will display F-ness unambiguously as the single feature those items have in common; thus, if we ever come to understand what F-ness is, it will be only by an inner illumination that reveals something that cannot be unambiguously pointed to or displayed. In *De magistro*, Augustine concludes that no 'outward' teacher can teach us what anything is by asking or telling us something. At most, the 'outward' teacher can admonish or remind us to look 'within', where Christ the inner teacher dwells. Christ is identified as 'the

unchangeable excellence of God and the everlasting wisdom that every rational soul does indeed consult' (*De magistro* 11.38) (see Illumination).

More generally, Augustine, like Plato before him, insists that 'intelligible realities', presumably including what we might think of as a priori truths, cannot be learned or even confirmed in sense experience. However, Augustine explicitly rejects Plato's idea that the soul might have been introduced to the intelligible realm before birth; instead he espouses innatism. Referring to the Socratic interrogation of the slave boy in Plato's *Meno*, which is meant to demonstrate that there is latent knowledge of geometry even among the untutored, Augustine protests that not all would have been geometricians in their previous life, 'since there are so few of them in the human race that one can hardly be found.' He goes on:

> We ought rather to believe that the nature of the intellectual mind is so formed as to see those things which, according to the disposition of the Creator, are subjoined to intelligible things in the natural order, in a sort of incorporeal light of its own kind.
>
> (*De trinitate* XII.15.24)

5 Philosophy of mind: dualism and memory

Although arguments for soul-body, or mind-body, dualism are almost as old as Western philosophy, all such reasoning before Augustine seems to have started from an externalist or third-person perspective. Thus when Plato in the *Phaedo*, for example, has Socrates claim that we have knowledge we could not have acquired in this life and therefore our souls must have existed before they took on this bodily form, he is reasoning from a perfectly impersonal point of view.

By contrast, Augustine's approach is ego-centred, or first-personal. In Book VIII of *De trinitate*, he claims that we, from our own individual first-person perspective, 'know what a soul is, since we have a soul'. In the next book he adds, 'When the mind knows itself, it alone is the parent of its own knowledge' (*De trinitate* IX.12.18). In the following book he surveys philosophical theories about what the mind is (for example, that it is blood, that it is the brain, that it is a collection of atoms, that it is air, that it is fire, that it is some 'fifth body' or that it is a harmony). Reflection on this divergence of philosophical views suggests that the mind does not really know what it is. Yet if, as Augustine has maintained, the mind knows what a mind is from its own case, then it knows and is certain what a mind is. Therefore if the mind is uncertain whether it is blood, or the brain, or fire, or air, or indeed anything corporeal, it is really none of these things; if it is in fact uncertain as to whether it is any of these corporeal things, then it is none of them (*De trinitate* X.10.16).

Of course, the idea that the mind can know what a mind is only from its own case raises the problem of other minds. How do I know that there are minds to go with other human or animal bodies, if all I can ever observe are the motions of those bodies? Augustine's response is the earliest statement of the notorious argument from analogy. 'Just as we move our body in living', Augustine writes, 'so, we notice, those bodies are moved'. We come to think that there is something present in another body 'such as is present in us to move our mass in a similar way'(*De trinitate* VIII.6.9).

Recently, philosophers such as Norman Malcolm (1963) have argued that it is a mistake to suppose that one could come to know from one's own case what a mind is, or what thinking or feeling or having a pain is. They argue that we need a criterion to determine whether x is in pain or whether y even has a mind. Since one does not use a criterion in one's own case, they continue, either the argument from analogy could never get started (because we lack the needed criterion) or it is otiose (because we have such a criterion). Argumentation of this sort is often taken to be directed at Descartes' philosophy of mind; but in fact it is Augustine, rather than Descartes, who offers the argument from analogy and who maintains that each of us knows what a mind is from our own case, and can know what a mind is only from our own case (see Descartes, R. §§7-8).

Although Augustine's theory of sense perception seems not to be representational in the sense of making an image or sense-datum the object, or at least the direct object, of perception, his account of memory does seem to be representational. He is inclined to think of what is remembered, or perhaps what is remembered directly, as an image rather than as what the memory image portrays. Indeed, in *De magistro* he asserts flatly, 'When a question arises not about what we sense before us, but about what we have sensed in the past, then we do not speak of the

things themselves, but of images impressed from them on the mind and committed to memory' (*De magistro* 12.39). Augustine concludes, incorrectly, from the fact that we have no direct access to absent persons and things, or past events, that there is no way one can make claims about *them*, as distinct from their images, and hence there is no way we can, either falsely or truly, remember those past or absent things themselves.

Although Augustine sometimes uses *memoria* in ways that suggest that it means simply 'memory', he also uses the term much more broadly. Thus Book X of the *Confessiones* is a treatise on *memoria* as mind. In that book, Augustine tells us that the storehouse of his *memoria* includes not only images of objects and of past events but also feelings and experiences, certain facts, himself (!), and principles and laws of various sorts.

About feelings, Augustine asks how one could know what the terms for them mean unless on hearing, for example, the term 'pain', one had in one's *memoria* what that term means. However, if one had pain itself in one's *memoria*, he reasons, it would hurt just to think about the meaning of the word. Yet surely, he goes on, one can think about what 'pain' means, or what a pain is, without being in pain. But how? Augustine is not able to say. Although this apparently original criticism of imagist accounts of meaning seems quite devastating, it did not lead Augustine himself to turn away from his effort to appeal to images in explaining how words for feelings, or moods (such as 'happy' and 'sad') have the meaning they do.

6 Philosophy of mind: will

As Albrecht Dihle (1982) and others have argued, the concept of the will, important in much medieval and modern philosophy including the idea of a volition as an act of will, can be said to originate with Augustine. Plato's division of the self in his *Republic* into reason, spirit and appetite, by contrast, seems to make no room for the will as a distinct faculty or power, and Aristotle's subtle discussion of the voluntary in Book III of his *Nicomachean Ethics* seems not to presuppose the idea of any such force or power as the will.

In *De trinitate*, Augustine presents among other putative analogies to the divine Trinity the mental trinity of memory, understanding and will. His suggestion is that just as each of the three divine persons, Father, Son and Holy Spirit, is distinct from the other two - though each is also God and not just part of God - so memory, understanding and will are each distinct from each other, though each is also mind and not just part of mind. Yet Augustine also recognizes that the human mind, with its various trinities, is only an imperfect image of the divine Trinity. The mind-as-will may well operate in opposition to the mind-as-understanding; indeed, a will that is evil does just that. The idea of there being such a thing as what the Greeks called *akrasia* - doing what one knows one ought not to be doing - is thus not a conundrum for Augustine, in the way that it is for Socrates and Plato, or even for Aristotle in *Nicomachean Ethics* VII 3 (see Akrasia).

Sometimes Augustine suggests that what he terms 'the first cause of sin', namely the will, is itself uncaused. 'What cause of the will could there be', he asks rhetorically in *De libero arbitrio* (III.17), 'except the will itself?' This point is important to Augustine since, as he claims in this passage, there would be no such thing as sin if the acts of one's will were caused by something extraneous to the will. The idea of the will as a first, uncaused cause, should be coupled with Augustine's claim that the will is 'in our power'. Since it is in our power, he writes, it is free for us (*De libero arbitrio* III.3).

There is also, however, a competing suggestion also to be found in Augustine, to the effect that God, through his knowledge, is the cause of all that he foreknows, including free choices of the will (see §7). Since Augustine defines 'will' (*voluntas*) as 'a movement of the soul, under no compulsion, either toward getting or not losing something' (*De duabis animabus contra Manichaeos (On the Two Souls)* 10.14), it follows that the will is free from compulsion. In discussing this definition Augustine makes clear that ignorance, though it may excuse an action that would otherwise count as sinful, does not render the will unfree (*Retractationes* 14.3).

In his efforts to define and reject Pelagianism as a heresy, however, Augustine has to explain how the grace of God can work on the human will without destroying its freedom. 'Do we then by grace make free will void?' is how he puts the challenge to himself in *De spiritu et littera (On The Spirit and the Letter)* XXX.52. His answer is that, no, 'free will is not made void through grace, but is established, since grace cures the will whereby righteousness is freely loved.' This is the doctrine of 'prevenient' grace, which Augustine distinguishes from various other kinds of grace. The concept of the will is thus a point of intersection for several characteristic Augustinian doctrines. First, human wills are depraved as a result of Adam's original sin. Second, a human will is able to act rightly only

through the grace of God. Third, if our wills were not free, we could not be justly punished for choosing wrongly. Fourth, God foreknew who among human creatures would choose rightly and become saints, and he also predestined them, or foreordained that they would do so. It seems that Augustine's emphasis on the efficacy and importance of God's grace must inevitably qualify his defense of free will. Nevertheless, the anti-Pelagian writings Augustine composed in the last two decades of his life are eloquent testimony to the ingenuity with which he sought to reconcile the doctrine of divine grace with his insistence that human beings are free to make their own choices (see Grace).

Augustine's efforts to establish the compatibility of God's foreknowledge with human free will were almost as extensive as his attempts to show that God's grace is also compatible with free will. However, Augustine paid much less attention to the worry that predestination also poses a threat to the possibility of free will. Thus in his *De praedestinatione sanctorum (On the Predestination of Saints)* 37, he insists that God chose the elect 'before the foundation of the world', not simply because they were in fact going to be 'holy and immaculate' but that they might become so. Clearly he thinks of predestination as something additional to mere foreknowledge. So, even if we understand how it can be that God's foreknowledge does not render our choices unfree, we will still need to deal with the additional threat to our freedom that seems to be posed by predestination (see Predestination).

Knowing, as already noted, can be thought of as a sort of seeing; and we are not usually tempted to think of seeing as determining the nature of what is seen. However, predestination is a form of predetermination, and how predetermination can be compatible with human freedom is much more difficult to understand. Augustine, though he certainly does not ignore this problem, is less helpful in showing how it can be dealt with than he is with the problem of foreknowledge and free will.

7 Metaphysics: God and divine attributes

In *De libero arbitrio* (II.15.39), Augustine offers an argument for the existence of God. He first gets his interlocutor to admit that (1) *x* is God if and only if *x* is more excellent than our minds and nothing is more excellent than *x*. He then tries to establish that (2) truth exists and is more excellent than our minds. From these two premises he concludes that (3) something is God (in other words, God exists). His idea is that either nothing is more excellent than truth, so that, since truth is more excellent than our minds, truth itself is God; or else something is more excellent even than truth, in which case it (or, we could add, something even more excellent than it) is God.

In fact, Augustine has the idea that God is not only something more excellent than our minds, but is also something than which our minds can conceive nothing more excellent. Thus he writes that 'God is the supreme good, and that than which nothing can be nor can be conceived to be better.' This formula is remarkably close to the one Anselm uses in formulating the ontological argument: 'For we believe that you are something than which nothing greater can be conceived' (*Proslogion* 2) (see God, concepts of).

Augustine made important contributions toward the project of giving a philosophical analysis of the divine attributes, or divine 'names', as philosophers of the high Middle Ages sometimes called them. Thus he made clear that, although God is omnipotent, he is unable to do certain things, such as sin, die or make a mistake. According to Augustine, '*x* is omnipotent' means that '*x* does whatever *x* wills'. However, Augustine does not deal with seeming difficulties posed by this account, for example, whether 'if God wills to sin, God sins' can be true even if its antecedent is necessarily false, or what to say about an agent with only minimal power whose wants, because they are also minimal, never outrun the agent's power to satisfy them (see Omnipotence).

Augustine is perhaps the first in a long line of philosophers to maintain that God is perfectly simple, that is, that God is identical with his attributes (*De civitate Dei* XI.10; *De trinitate* VI.7.8). Thus God is his goodness, he is his wisdom, and so forth. Later philosophers who made this claim central to their philosophical theologies include Anselm and Aquinas (see Immutability; Simplicity, divine).

Augustine links divine simplicity to God's immutability. Sometimes he even explains simplicity in terms of immutability. 'The reason why a nature is called simple', he writes, 'is that it cannot lose any attribute it possesses, that there is no difference between what it is and what it has' (*De civitate Dei* XI.10). He goes on to add that even the incorruptible body we shall receive in the resurrection is neither simple nor unchangeable. That body will not be simple, he maintains, because the substance 'in virtue of which it is called a body is other than the

quality from which it derives the epithet incorruptible.' Even the human soul, he continues, is other than its wisdom. Only God *is* his wisdom.

In his effort to clarify the divine attributes, Augustine sometimes admits defeat. Thus, in Book I of *De doctrina Christiana*, he concedes that his efforts to clarify the doctrine of the Trinity have been unworthy of God and suggests that God is ineffable. He then notes that to say God is ineffable is to describe God and therefore to show, by saying it, that what one says is false.

8 Metaphysics: creation, time and eternity

Plato, in his *Timaeus*, pictures creation as the action of a divine craftsman who looks at eternal paradigms to form instances in an also pre-existent 'receptacle'. Augustine, interpreting Genesis 1: 1 to mean that God created the heavens and the earth out of nothing (*ex nihilo*), insists that God created unformed matter, as well as what he formed from it. His rejection of the Platonic alternative is explicit: 'You did not hold anything in your hand, of which you made this heaven and earth; for how could you come by what you had not made, to make something? For what is there that exists, except because you exist?' (*Confessiones* XI.5.7). Augustine's assumption is that nothing exists, except because God exists. Moreover, because everything changeable has a beginning, and the heavens and the earth are certainly changeable, God created them.

Not only did God create the world, and create it out of nothing, according to Augustine, he also conserves or sustains it, lest it disappear into nothing. If God's power 'ever ceased to govern creatures', he writes:

> their essences would pass away and all nature would perish. When a builder puts up a house and departs, his work remains in spite of the fact that he is no longer there. But the universe will pass away in the twinkling of an eye if God withdraws his ruling hand.
>
> (*De genesi ad litteram* IV.12.22)

Here is the precursor of Descartes' idea that 'the same power and action are needed to preserve anything at each individual moment of its duration as would be required to create that thing anew if it were not yet in existence' (*Meditation* III) (see Creation and conservation, religious doctrine of).

If the idea that God created matter is philosophically troublesome, even more puzzling is the contention, which Augustine affirms, that God created time. To make sense of that claim, one must study what Augustine says about time. In a much cited passage, Augustine asks, 'What then is time?' and responds: 'If nobody asks me, I know; but if I am asked what it is and want to explain, I don't know how to' (*Confessiones* XI.14). Wittgenstein (1958a: 26) thought this question epitomized philosophy as a misguided search for definitions (see Wittgenstein, L. §§15-17). By contrast, Bertrand Russell praised Augustine's theory of time as 'a very able theory, deserving to be seriously considered', and 'a great advance on anything to be found on the subject in Greek philosophy' (Russell 1945: 354).

In his discussion, Augustine appeals to the fact that we speak of 'a long time' and 'a short time'. He then develops a perplexity that Aristotle had raised in a highly condensed form in Book IV of his *Physics* but never resolved. 'How can anything that does not exist', Augustine asks, 'be either long or short?' (*Confessiones* XI.15.18). But the past is no more and the future is not yet, he continues; only the present exists. 'Can present time be long?' he asks. For any present period of time, he notes - the present century, the present year, the present day, or whatever - part of it is no more and part is not yet. All that is ever really present is the instantaneous divider between what is not yet and what is no more. As a simple divider between the past and the future, the present, the 'now', has no duration at all and so cannot be either long or short. Therefore, how can times be either long or short? Augustine concludes that it is in his own mind that he measures time. It is mental impressions that one measures, he says, and therefore time is the measure of something mental.

Early on in Book XI, Augustine had sought to deal with the sceptical question, 'What was God doing before he made heaven and earth?' (*Confessiones* XI.10.12). His answer is to say that 'there cannot possibly be time without a creature [*sine creatura*]' (*Confessiones* XI. 30), presumably because the mind of God is timeless, as time is a measure of created minds.

In Book XI of *De civitate Dei*, Augustine seems to revert to a more Platonic theory of time, according to which

time is the motion of bodies, perhaps especially the motion of the heavenly bodies. The explicit question up for discussion is why God made the world at one time rather than another. Augustine may have derived this sceptical question, and the earlier one in *Confessiones* introducing the discussion of time, from Cicero's *De natura deorum*, although Cicero was himself passing on discussions that have their roots in Presocratic philosophy.

It would have been odd for Augustine to conclude that time is the measure of bodily motion, since he explicitly rejects such a theory in *Confessiones* with the apt objection that time may equally be the measure of a body's rest. In Book XII of *De civitate Dei*, however, Augustine makes it clear that he considers the movements of the angels to be sufficient for there to be time. Angels have always existed, he claims, in the sense that there is no time at which they failed to exist. Nevertheless, they are created beings; indeed time was created with them.

In supposing that God creates time, Augustine does not of course suppose that this creation took place in time. 'There can be no doubt', he writes, 'that the world was not created *in* time but *with* time' (*De civitate Dei* XI.6). Augustine's idea is that God timelessly creates time; indeed, God's own being is immutable and timeless. In supposing that God timelessly creates time, Augustine avoids a paradox in the idea of time having been created. One might otherwise suppose that the idea of time having been created must somehow involve a contrast between a time when there was no time and the temporal period that began with time's creation. The absurdity of that idea seems to have led Aristotle to reason that time, like the universe, is eternal. But Aristotle did not consider the Augustinian idea that God timelessly creates time, perhaps even a first time (see Time).

Though Augustine often uses temporal words to talk about God and God's actions, those words are to be understood in a special sense. Sometimes Augustine warns his readers of this need. Thus he writes in *Confessiones* (XI.13.16), addressing God: 'It is not in time that you are before times; otherwise you would not be before all times; you precede all past times in the loftiness of your ever-present eternity.' He adds, 'Your years, because they abide, all abide at once.'

One might suppose that, if God is eternal in the sense of being 'before' or 'outside' all time, God could have no causal efficacy *in* time. With similar reasoning, Aristotle complained that Plato's Forms, being eternal and unchanging, could not be the cause of something's happening now rather than earlier or later. With Aristotle's criticism in mind, a Christian believer might complain that Augustine's depiction of God as being out of time means that God could not act in history. Augustine is, however, in a rather different position from Plato, since he supposes God to have created time. Though we may speak of God's actions *in* history, God in Augustine's view brings it about timelessly; there is time in which the entities of creation can act and be acted on by him. In the dialogue *De libero arbitrio* (II.3), the character Evodius maintains that 'God has decided once and for all how the order of the universe he created is to be carried out, and does not arrange anything by a new act of will' (see Eternity).

Following in the Platonic and Neoplatonic tradition, Augustine supposes there are different senses of 'exist', or ways in which something may be said to exist. He assigns the highest way, or the strictest sense, to the existence of God: 'Being is in the highest and truest sense of the term, proper to Him from whom being derives its name' (*De trinitate* V.2.3). Here Augustine links Platonic metaphysics with God's saying to Moses in Exodus 3:14, 'I am who am.' God truly is, Augustine writes in *De natura boni* 19, because he is immutable. 'For every change', Augustine goes on, 'makes what was, not to be; therefore he truly is who is unchangeable.'

9 Philosophy of religion: problem of evil

Although the author of the biblical book of Job questioned how it can be that unjust suffering is compatible with the nature of God, he seems not to have had a problem with the mere existence of evil. It may be that Epicurus was the first thinker to ask how the existence of evil could be compatible with the nature of God (Lactantius, *De ira Dei (The Wrath of God)* 13).

In *Confessiones* (VII.5.7), Augustine raises this compatibility problem in a particularly persistent way. Put in a somewhat more modern way, the problem is how the statements (1) God is all-good and (2) God is all-powerful, can be consistent with (3) there is evil. Although the conjunction of these three statements is not logically inconsistent, it is natural to assume that (4) if there existed some being both all-good and all-powerful, evil would not exist. The conjunction of (1), (2), (3) and (4) is indeed logically inconsistent (see Evil, problem of; Leibniz, G.W. §3).

When Augustine was a Manichean, he rejected (2) and, insofar as for Manicheans the principle of evil was coequal with the principle of good, there is a way in which he could also be said to have rejected (1). However, as Augustine moved toward Christianity, those options became closed. In *Confessiones* (VII.5.7), Augustine considers rejecting (3). ‘Can it be’, he asks, ‘that there simply is no evil?’ But if there really is no evil, he reasons, our fear of evil is unfounded; however, an unfounded fear of evil would itself be evil. If there is no evil, therefore, there is evil; so, there is evil. Augustine returns a few sections later in the same work to embrace the Neoplatonic idea that evil is not a reality but a mere privation and so, in a way, does not exist. Yet the fear of something nonexistent can itself be evil.

In *De civitate Dei* (XII.8), Augustine finds the root cause of evil in human free will. ‘A will could not become evil’, he writes, ‘if it were unwilling to become so; and therefore its shortcomings are justly punished, being not necessary but voluntary.’ In insisting that the existence of free but evil choices of human agents is compatible with the all-goodness and all-power of God, Augustine thus rejects (4) above. Since the problem of evil, conceived as a problem about the apparent inconsistency among (1), (2) and (3), is a purely *a priori* problem, all one would need to do to solve it would be to show that (4) is not a necessary or conceptual truth. Augustine, however, tries to do more; he tries to show that (4) is actually false.

When Augustine uses what has recently come to be called the ‘free-will defence’ to solve the problem of evil, he does not reject the logical possibility that human beings might have been created to have free will, yet never sin. For example, he supposes that the saints in heaven will have free will, yet they will sin no more. ‘Now the fact that they will be unable to take pleasure in sin’, he writes in *De civitate Dei* (XXII.30), ‘does not entail that they will have no free choice. In fact, the will will be the freer in that it is freed from taking pleasure in sin and immovably fixed in the pleasure of not sinning.’ Adam’s freedom, Augustine goes on in the same passage, was an ability not to sin, combined with the possibility of sinning. The freedom the saints will enjoy in heaven will bring with it, he says, the impossibility of sinning. Lest we protest, in the manner of philosophers who have discussed this issue in our own time, that the impossibility of sinning would destroy free will, Augustine adds that God cannot sin, yet surely God has free will.

Thus Augustine’s rejection of (4) does not rest on a rejection of the logical possibility that God might have created a sinless world in which agents exercise their free will. Rather, it rests on Augustine’s belief that the impossibility of sinning, when it finally comes to the saints in heaven, is a free gift of God’s grace, not anything God is constrained to bestow on creatures, not even by his all-goodness. Another way that Augustine tries to show (4) is false is to suggest that evil, or sin, is like a dark colour in a beautiful painting: in itself, ugly, but in context something that contributes to the beauty and goodness of the whole (*De civitate Dei* XI.23).

10 Philosophy of religion: divine foreknowledge and free will

The problem of how God’s foreknowledge of what an agent will do is compatible with that agent’s acting freely seems to be a specific version of the problem Aristotle discusses in *De interpretatione* about how the prior truth of a statement about a future event is compatible with that event’s being contingent. Aristotle’s discussion and the commentaries on it by Boethius, as well as the latter’s own discussion of the problem of foreknowledge in Book V of his *De consolatione philosophiae (The Consolation of Philosophy)*, were influential on later medieval discussions. Also influential, however, was Augustine’s discussion in Book III of his *De libero arbitrio*, and perhaps even more so in Book V of the *De civitate Dei*.

In *De civitate Dei*, Augustine takes Cicero as his target. As represented by Augustine, Cicero argues that (1) if God foreknows all events, then all events happen according to a fixed, causal order, and (2) if all events happen according to a fixed, causal order, then nothing depends on us and there is no such thing as free will. If we can then add (3) God foreknows all events, as Augustine insists we can, we can conclude that (4) nothing depends on us and there is no such thing as free will. Augustine attempts to defeat this argument by insisting that ‘our wills themselves are in the order of causes’ (*De civitate Dei* V.9), and adds it is necessary that, ‘when we will, we will by free choice’ (V.10). Moreover, among the things that God foreknows are the things that we will to do of our own free choice. Thus premise (2) is false and God’s foreknowledge, rather than being a threat to free will, is in a way its guarantor.

Talk of God’s foreknowledge, as Augustine himself realizes and points out, is somewhat misleading. God, as an

eternal being, is outside time. However, for any event that to us temporal creatures is still in the future, it is true to say of God that God knows, as we should say from our own point of view, 'already' what will happen. Augustine's explicit discussion of the problem of foreknowledge and free will proceeds as though God's knowledge perfectly reflects the causal order in which human wills operate freely, without itself causing that order. Thus he insists in *De civitate Dei* (V.10), for example, that 'it is not that one sins because God foreknew that one would sin'. But in fact, Augustine, like Aquinas after him, seems to hold the view that God's knowledge actually causes to happen what God knows will happen.

The context for Augustine's assertion that God causes what he knows is a discussion of how God can know the material world without himself having a body or any sense organs. Rejecting the suggestion that God might need messengers of any sort, whether sense organs or angelic witnesses, Augustine boldly denies that God's knowledge is in any way dependent on what he knows. God does not know creatures because they are, he writes in *De trinitate* (XV.13.22); rather, they are because God knows them. Indeed, Augustine adds in the same passage, God learns nothing about creatures from the creatures themselves. If then we are unable to surprise God with any of our free choices, and God's perfect and immutable knowledge not merely reflects but actually causes us to be the (to God) unsurprising creatures we are, how is there any metaphysical room for human free will? And how can it not be the case that we sin because God foreknows we will?

It seems to be Augustine's view that God's foreknowledge that, for example, Peter would deny Christ three times somehow causes Peter's denial without making it unfree and, therefore, without detracting from Peter's responsibility for it. Indeed, the view seems to be that God's foreknowledge of a free choice can cause there to be the very free choice that there is. Moreover, even though the choice is caused by God, it is the agent, not God, who makes the choice. Since the free choice is voluntary, the agent is responsible for it.

Of course, the problem mentioned earlier as to how predestination is consistent with free will is directly relevant here. If Augustine's account of God's grace can make clear how it is possible for God to foreordain and predestinate human choices without rendering those choices unfree, then perhaps it will also make clear how God can cause them without making them unfree. On the face of it, however, the claim that (1) God causes everything he foreknows, including the free choices human beings make, seems simply to contradict the assurance that (2) 'it is not that one sins because God foreknew that one would sin' (*De civitate Dei* V.10). If there should be no satisfactory way of reconciling (1) and (2), (1) should be qualified or rejected as a true reflection of Augustine's view, since it is far less prominent in Augustine's writings than the repeated insistence on (2) (see Free will; Omniscience; Predestination).

11 Philosophy of religion: faith, reason and mysticism

When discussing the relationship of faith and reason, Augustine characteristically insists that faith must precede understanding. 'For understanding is the reward of faith', he writes in his *In Ioannis evangelium tractatum (Homilies on the Gospel of John)*, adding: 'Therefore do not seek to understand in order to believe, but believe that you may understand' (29.6).

The comment of Augustine's interlocutor, Evodius, in the dialogue *De libero arbitrio* (II.2), 'But we want to know and understand what we believe', is apt, not only for much of Augustine's own writing but for much of medieval philosophy as well. The *Proslogion*, the treatise in which Anselm develops his famous ontological argument, carries the Augustinian subtitle, 'Faith in Search of Understanding'.

In Question 48 of *De diversis quaestionibus LXXXIII (Eighty-Three Different Questions)*, Augustine divides the classes of things to be believed into three. In the first class, ranging over the temporal dealings of human beings, are things that are 'always believed and never understood'. In the second group, which are 'understood as soon as they are believed', are 'human reasonings'. It is the third group, which concern divine dealings, that are first believed and afterward understood. However, even if 'I believe in order that I may understand' applies only to theological questions, there is still a problem. How can one believe something before one even understands it? As Augustine himself points out in his sermons, his hearers need to understand what he is saying before they are in position to believe what he says. How can one believe, for example, the biblical claim that the earth was once invisible and without form before one even understands what that claim means? In *Confessiones* (XII.23), Augustine makes a distinction between questions about truth and those about meaning. He seems to suppose one

can accept that, for example, the biblical account of creation in Genesis 1 is true without knowing what each of the statements that make it up means. Of course one would need to have some general idea of what those statements might mean in order for one's faith in the truth of the account to have any real content, but even a minimal understanding might be enough to give one's faith some purchase.

How, though, did Augustine think one is to choose among rival authorities in coming to accept, for example, some biblical or creedal statement, or some commentary on the Bible or the creed, as true? He seems to have allowed for both prior and subsequent contraints on what should be believed. As for prior constraints, he writes in *De moribus ecclesiae catholicae (Morals of the Catholic Church)* 7.11: 'We must have recourse to the teachings of those who were in all probability wise'. As for subsequent constraints, he looked for predictions that are not borne out as discrediting a putative authority. Thus he discredited astrologers in *Confessiones* (VII.6) by pointing out that it sometimes happens that a slave in misery has a twin brother who prospers as a freeman, though the twins were born under precisely the same astrological sign.

Later in *Confessiones* (VII.17), Augustine describes an early attempt at mystical ascent. Though 'in an instant of awe', his mind, he says, caught sight of God, he had not the strength to continue the vision; the memory remained with him as something he longed for. In the same work, he describes a more prolonged ascent that grew out of conversation with his mother:

> As the flame of love burned stronger in us and raised us higher towards the Selfsame, we passed through all corporeal things, and the heavens themselves, from which the sun and the moon and the stars shine down upon the earth…. At length we came to our own minds and passed beyond them to that place of everlasting plenty, where you feed Israel forever with the food of truth. There life is the Wisdom by which all things are made.
>
> (*Confessiones* IX.10)

Shortly thereafter Augustine's mother died.

Augustine wonders whether the moment when he and his mother 'reached out in thought and touched the eternal Wisdom' prefigured life in heaven. In perhaps his most eloquent description of the beatific vision, Augustine suggests that such an experience may help one live a more moral life on earth:

> There the virtues of the soul are not laborious and wearisome. For there desire is not bridled by the work of temperance, or adversities borne by the work of fortitude, or iniquities punished by the work of justice, or evils shunned by the work of prudence. There the one virtue and the whole of virtue is to love what you see and the greatest happiness is to have what you love. For there the heavenly life is drunk at its source, from which a little is splashed over onto this human life so that it is lived among the temptations of this world with temperance, with fortitude, with justice, and with prudence.
>
> (*De genesi ad litteram* XII.26.54)

In Chapter 7 of the treatise *De cura pro mortuis (On the Care of the Dead)*, Augustine raises a problem for the understanding of religious ritual. He wonders what can be the point of bending one's knees, holding out one's hands or prostrating oneself in supplication to God when the prayer we have in our hearts is already known to God. Augustine's problem is really two problems. First, why should we go through a prayer, whether inwardly or outwardly, when God already knows what we want to say? Second, why should we give outward expression to a prayer, since God, the intended recipient, knows already what we say inwardly in our hearts? He then gives an answer which is intended to apply to both problems: 'Although these motions of the body cannot come to be without a motion of the mind preceding them, when they have been made, visibly and externally, that invisible inner motion which caused them is itself strengthened' (*De cura pro mortuis* 5.7). The idea is that going through a prayer intensifies the thoughts and feelings that the prayer expresses, which answers the first problem. Moreover, doing this outwardly, with appropriate bodily motions, strengthens the inner feelings that such bodily motions express, thus answering the second problem. Augustine must have known as well as we do today that ritual sometimes actually gets in the way of our thinking the thoughts and having the feelings that the ritual is supposed to express. However, it would be enough for him if religious ritual regularly, or even just often, had the effect of nurturing and strengthening religious feelings and attitudes.

An odd thing about Augustine's response to his problem is that, according to his own metaphysical principles, the

response is inappropriate, or even false. The reason is that, in Augustine's view, the soul or mind is superior to the body and what is superior cannot be affected by what is inferior to it (*De genesi ad litteram* XII.16.33). So, neither the physical productions of sound in saying a prayer nor the physical movements of kneeling or stretching out one's hands can possibly have the effect of intensifying thoughts or feelings.

No doubt what Augustine should have concentrated on is not the bodily motions of tongue, hand or knee in prayer, but rather the importance to a relationship, whether it is a relationship with God or with another human being, of giving expression to one's feelings of gratitude, remorse or whatever else might be appropriate. Thus God's omniscience is really inessential to the issues Augustine is raising. Because some person, A, knows another person, B, very well, it might be the case that A knows that B is sorry for having wronged A, even though B has not yet apologized or asked for forgiveness. In that case, for A to apologize or ask for forgiveness would not have the purpose of passing on information to A; nevertheless, it might be important to their relationship. This might also be true of a relationship between a human being and God. This alternative response to the problems Augustine raises about ritual should remind us of Augustine's tendency, noted in the discussion of *De magistro* above, to try to reduce the role of language as well as that of gesture to one of passing on information, or even to merely reminding us of what we already know.

12 Ethics: sin, vice and virtue

For Socrates, Plato and Aristotle, there existed the problem of how we can ever do what we know we ought not to be doing. This is the problem of *akrasia* (see Akrasia). From this ancient perspective, perhaps the most striking thing about Augustinian ethics is its easy acceptance of *akrasia*. In *Confessiones* II, Augustine tells of stealing pears as a boy of sixteen. He spends two chapters ruminating on what might have motivated his theft. It was not the pears themselves, he says, for he had better ones at home. He concludes that it was the flavour of sinning that motivated him.

In *De libero arbitrio* (I. 2), Augustine admits that the question of why we do evil disturbed him greatly when he was young and moved him toward Manicheism. Once he accepted the idea of original sin, however, he found nothing paradoxical in saying of someone: 'He hates the thing itself because he knows that it is evil; and yet he does it because he is bent on doing it' (*De nuptiis et concupiscentia (On Marriage and Concupiscience)* I.28.31).

Augustine was an extreme intentionalist in ethics. In *De sermone Domini in monte (Commentary on the Lord's Sermon on the Mount)* I.12.34, he identifies three necessary and sufficient conditions for committing a sin: receiving an evil suggestion, taking pleasure in the thought of performing the act suggested and consenting to perform the act. Thus in Augustine's view, whether one commits a sin is in no way dependent on whether the contemplated action is actually carried out. Even when the action is carried out, it is the intention (understood as suggestion, pleasure and consent), rather than the action itself, or its consequences, that is sinful.

Augustine also devoted two treatises to the topic of lying. In the first of these, *De mendacio (On Lying)*, he first suggests that a person *S* lies in saying *p* if, and only if (1) *p* is false, (2) *S* believes that *p* is false and (3) *S* says *p* with the intention of deceiving someone. He then considers three cases: first, that of someone with a false belief who wants to deceive another by saying something that is, unknown to them, quite true; second, the case of someone who expects to be disbelieved and so knowingly says what is false in order to instill a true belief; and third, the case of someone who, also expecting to be disbelieved, knowingly speaks the truth in order to instill a falsehood. Augustine seems not to know what to do about these problem cases. He contents himself with insisting that the conditions (1)-(3) are jointly sufficient, without taking a stand on whether each is singly necessary (*De mendacio* 4.5).

Discussing virtue and vice, Augustine contrasts those things that are desirable in themselves with those that are desirable for the sake of something else. He says that things of the first sort are to be enjoyed (*frui*) whereas those of the second sort are to be used (*uti*). Vice, he adds, is wanting to use what is meant to be enjoyed or wanting to enjoy what is meant to be used (*De diversis quaestionibus LXXXIII* 30).

Ambrose had already added the Pauline virtues of faith, hope and love to the classical virtues of temperance, courage, wisdom and justice. Augustine follows Ambrose in this, and he follows St Paul in assigning first importance to love; in fact, he offers an interpretation of each of the seven virtues that makes it an expression of the love of God. Thus temperance is love 'keeping itself whole and incorrupt for God'; fortitude, or courage, is

love ‘bearing everything readily for the sake of God’, and so on (*De moribus ecclesiae catholicae (On the Morals of the Catholic Church)* 15.25). Virtue, he says, is nothing but the perfect love of God. In this way Augustine provides a Christian analogue to Plato’s idea of the unity of the virtues (see Virtues and vices).

13 Ethics: ‘ought’ and ‘can’

Augustine also attacked the Pelagians for their views on the avoidance of sin, focusing on the question of ‘ought’ and ‘can’. Two of his contemporaries, the British monk Pelagius and his disciple Coelestius, had made the principle that ‘ought’ implies ‘can’ a central tenet of their religious and ethical teaching. As already noted, Augustine was the person primarily responsible for defining their teaching, Pelagianism, as a Christian heresy (see Pelagianism). In his treatise *De perfectione justicia hominis (On Man’s Perfection in Righteousness)*, subtitled ‘In opposition to those who assert that it is possible for one to become righteous by one’s own strength alone’, Augustine describes the chief thesis of Coelestius as the contention that if something is unavoidable, then it is not a sin; there is simply no such thing as an unavoidable sin. Augustine responds to Pelagius and his disciple by rejecting the simple disjunction that either something is not a sin or it can be avoided. ‘Sin can be avoided’, he writes, ‘if our corrupted nature be healed by God’s grace.’ Thus in a way, Augustine agrees that ‘ought’ does imply ‘can’, but only with a crucial qualification. ‘Ought’ implies ‘can with the gratuitous assistance of God’, but it does not imply ‘can without any outside help’ (see Kant, I.).

Augustine’s response to dreaming as a possible threat to knowledge claims fits together with his intentionalism in ethics and his anti-Pelagianism to produce an interesting problem as to whether one is morally responsible for the acts of one’s dream self. He agonizes over this problem in *Confessiones* (X.30). Three ways of justifying a claim of no responsibility suggest themselves. I could say I am not responsible (1) because I am not my dream self, or (2) because what happens in a dream does not really happen, or (3) because I am powerless to avoid doing what my dream self does, and ‘ought’ implies ‘can’.

Augustine’s philosophical and theological commitments seem to undercut each of these three responses. Thus (1) is undercut, it seems, by his somewhat concessive response to scepticism. I can know that something tastes sweet to me, Augustine insists in *Contra academicos* (III.11.26), whether or not I am dreaming. It seems to be a consequence of this insistence that, if I am dreaming, I am my dream self. As for (2), it seems to be undercut by Augustine’s strong intentionalism in ethics. Thus when I commit adultery in my dreams, even if no ‘outward’ adultery takes place, still I entertain the evil suggestion, take pleasure in the evil suggested and give consent; so there is wrongdoing. As for (3), as noted above, Augustine rejects the Pelagian insistence that ‘ought’ implies ‘can’. or rather, he accepts it only with an important qualification. Although ‘I ought to refrain from consenting to fornicate’ does, in Augustine’s view, entail that I can so refrain with the help of God’s grace, it does not entail that I can refrain strictly on my own, that is, without any divine grace. Yet if I receive no grace and consent to fornicate, I sin, according to Augustine, and it is just for God to punish me.

14 Ethics: on killing

Although Augustine’s thoughts on suicide are not particularly original, they have been extremely influential. His position became Christian orthodoxy, which in turn influenced decisively the legal thinking in predominantly Christian countries. Augustine’s position is that, with certain specifiable exceptions (primarily, lawful executions and killings in battle by soldiers fighting just wars (see below), anyone who kills a human being, whether himself or anyone else, is guilty of murder (*De civitate Dei* I.21), and murder is prohibited by divine commandment (see Death; Suicide, ethics of).

Augustine did not invent the idea that certain requirements must be satisfied if a war is to count as just. The theory of just warfare - both the conditions that must be satisfied if a war is to be entered into justly (*jus ad bellum*) as well as the requirements of justice in the waging of war (*jus in bello*) - are already well developed by Cicero in his *On the Republic*. Nor was Augustine the first Christian thinker to develop a theory of just warfare; Ambrose had already done so (Christopher 1994). Nevertheless, Augustine is usually considered the father of the modern theory of the just war. Such deference is appropriate in that it is in Augustine, more than in Cicero or Ambrose or anyone else in the ancient world, that later theorists have found their earliest inspiration.

Although Augustine accepts the commandment, ‘Thou shalt not kill’, he interprets it in such a way that not

everyone who brings about the death of another can be properly said to kill. Thus, he writes in *De civitate Dei* (I.21), ‘One who owes a duty of obedience to the giver of the command does not himself kill; he is an instrument, a sword in its user’s hand.’ Thus an executioner may bring about the death of a convict without killing, and so may a soldier end another’s life without killing, especially when war is being waged ‘on the authority of God’.

In general, Augustine takes over the Roman principles of just war as set forth by Cicero and adds his own emphasis on the intention with which the acts of war are performed. This following passage is characteristic:

> What is the evil in war? Is it the death of some who will soon die in any case, that others may live in peaceful subjection? This is merely cowardly dislike, not any religious feeling. The real evils in war are love of violence, revengeful cruelty, fierce and implacable enmity, wild resistance, the lust of power, and such like; and it is generally to punish these things, when force is required to inflict the punishment, that, in obedience to God or some lawful authority, good men undertake wars.
>
> (*Contra Faustum manichaeum* 22.74)

Beyond such insistence that war should not be fought from love of violence, revengeful cruelty or lust for power, Augustine did not work out specific principles for the just conduct of war. Still, in making it plausible to many Christians that killing in war need not fall under the divine commandment not to kill, Augustine freed others to develop principles for what might be considered the just declaration of war, as well as the just conduct of war, once it has been justly entered into (see War and peace, philosophy of).

15 Philosophy of history

In the *Poetics*, Aristotle remarks that poetry is more philosophical than history. He seems to have thought of the historian as the mere chronicler of events, whereas the tragedian tells us what sort of person would, probably or necessarily, do or say what sorts of things. Augustine was the first important philosopher to treat the writing of history in a more philosophical way. In *De civitate Dei*, he rejects the idea of eternal recurrence, later associated with Nietzsche, according to which:

> just as Plato, for example, taught his disciples at Athens in the fourth century, in the school called the Academy, so in innumerable centuries of the past, separated by immensely wide and yet finite intervals, the same Plato, the same city, the same school, the same disciples have appeared time after time, and are to reappear time after time in innumerable centuries in the future.
>
> (*De civitate Dei* XII.14)

Although Augustine does not offer philosophical arguments for his own ‘linear’ view of history, he does offer a variety of criticisms of what he takes to be the main philosophical argumentation in support of the cyclical theories (*De civitate Dei* XII.18).

The account of history Augustine offers is meant to be a universal history, that is, a history of the world. It divides the history of the world into seven ages, analogous to the seven days of creation. The discussion proceeds, however, more as a gloss on scripture than by appeal to rational considerations or nontheological evidence. Although he does not try to establish the nature of ‘God’s universal providence’ by general considerations or evidence that is independent of Christian revelation, he does seek to establish that divine providence, like divine foreknowledge and divine predestination, is compatible with human free will. On a more general level he tries to establish that history can have a meaning, in fact the meaning God foreordains it to have, even though human agents are perfectly free; and indeed, are foreordained to be free (see History, philosophy of).

GARETH B. MATTHEWS

List of works

Augustine (386-429) Collected Works.(The seventeenth-century Maurist edition of Augustine’s works is to be found in J.P. Migne (ed.) *Patrologia Latina*, Paris, 1844-6, vols 32-47. Critical editions of many of his works are to be found scattered through the Corpus Scriptorum Ecclesiasticorum, Vienna: Tempsky, 1866-, as well as

in the Corpus Christianorum, Series Latina, Turnholt: Brepols, and The Hague: Nijhoff, 1953-. English translations of Augustine's major works are to be found in P. Schaff (ed.) *A Select Library of the Nicene and Post-Nicene Fathers of the Christian Church*, First Series, Edinburgh: T. & T. Clark, 1886-8, repr: Grand Rapids, MI: Eerdmans, 1971-74. A smaller selection is found in W. Oates (ed.) *Basic Writings of Saint Augustine*, New York: Random House, 1948, 2 vols. Individual works are also to be found scattered through the series Fathers of the Church, Washington, DC: Catholic University of America, 1947-, and in the series Ancient Christian Writers: The Works of the Fathers in Translation, New York: Newman, 1946-. The first English translation of Augustine's complete works is currently being published in 46 vols, edited by J.E. Rotelle, Hyde Park, NY: New City Press, in conjunction with the Augustinian Heritage Institute.)

Augustine (386) *Soliloquia (Soliloquies)*, trans. C.C. Starbuck, in W. Oates (ed.) *Basic Writings of Saint Augustine*, New York: Random House, 1948, vol. 1, 257-97.(A dialogue between Augustine and Reason, this work assumes the first-person persepctive that marks one of Augustine's special contributions to philosophy.)

Augustine (386) *Contra academicos (Against the Academicians)*, trans. P. King (along with *The Teacher*), Indianapolis, IN: Hackett, 1995.(Augustine's most sustained effort to refute the scepticism of the New Academy.)

Augustine (387) *De dialectica (On Dialectic)*, trans. B.D. Jackson, Dordrecht: Reidel, 1975.(The first book in a planned but later abandoned series on the liberal arts.)

Augustine (387/8) *De quantitate animae (The Magnitude of the Soul)*, trans. J.J. McMahon, Fathers of the Church vol. 4, Washington, DC: Catholic University of America, 1947, 49-149.(Augustine's early philosophy of mind.)

Augustine (387-9) *De moribus ecclesiae catholicae (Morals of the Catholic Church)*, trans. R. Stothert in P. Schaff (ed.) *A Select Library of the Nicene and Post-Nicene Fathers of the Christian Church*, First Series, 1886-8, vol. 4, 37-63.(Includes a Christian definition of the classical virtues.)

Augustine (388-95) *De diversis quaestionibus LXXXIII (Eighty-three Different Questions)*, trans D.L. Mosher, Fathers of the Church vol. 70, Washington, DC: Catholic University of America, 1977.(Short discussions of a variety of metaphysical, epistemological and theological topics.)

Augustine (388-95) *De libero arbitrio (On Free Choice of the Will)*, trans. T. Williams, Indianapolis, IN: Hackett, 1993.(The first philosophically important treatment of how to reconcile human free will with divine foreknowledge.)

Augustine (389) *De magistro (The Teacher)*, trans. J.M. Colleran, *The Teacher* (along with *The Greatness of the Soul*), New York: Newman, 1950; trans. P. King, *The Teacher* (along with *Against the Academicians*), Indianapolis, IN: Hackett, 1995.(An important attempt to consider whether the meanings of words can be learned by ostension.)

Augustine (389/91) *De vera religione (On True Religion)*, trans. J.H.S. Burleigh, *Augstine: Earlier Writings*, London: SCM Press, 1953, 218-83.(Augustine here finds truth even in doubting.)

Augustine (392/3) *De duabus animabus contra Manichaeos (On the Two Souls)*, trans. A.H. Newman in P. Schaff (ed.) *A Select Library of the Nicene and Post-Nicene Fathers of the Christian Church*, First Series, 1886-8, vol. 4, 91-124.(A spirited rejection of the Manichean idea that each person has both a good and an evil soul.)

Augustine (394) *De mendacio (On Lying)*, trans. M.S. Muldowney, Fathers of the Church vol. 14, Washington, DC: Catholic University of America, 1952, 45-120.(The earlier of two treatises devoted to an analysis of the sin of lying.)

Augustine (394) *De sermone Domini in monte (Commentary on the Lord's Sermon on the Mount)*, trans. J.J. Jepson, New York: Newman Press, 1948.(Perhaps the most important statement of Augustine's intentionalist ethics.)

Augustine (396-426) *De doctrina christiana (On Christian Instruction)*, trans. J.J. Gavigan, Washington, DC: Catholic University of America, 1947.(Augustine's handbook of biblical exegesis.)

Augustine (397-401) *Confessionum libri tredecim (Confessions)*, trans. F.J. Sheed, Indianapolis, IN: Hackett, 1993; trans. R.S. Pine-Coffin, Harmondsworth: Penguin, 1961; trans. H. Chadwick, Oxford: Oxford University Press, 1991.(This is no doubt the most widely and frequently translated of Augustine's works. The above are the English translations deserving of special mention.)

Augustine (399) *De natura boni contra manichaeos (The Nature of the Good)*, trans. A.H. Newman in W. Oates (ed.) *Basic Writings of Saint Augustine*, New York: Random House, 1948, vol. 1, 429-57.(An attempt to make plausible the idea that evil is a privation.)

Augustine (400) *Contra Faustum manichaeum (Reply to Faustus)*, trans. R. Stothert in P. Schaff (ed.) *A Select Library of the Nicene and Post-Nicene Fathers of the Christian Church*, First Series, 1886-8, vol. 4, 151-345. (A major polemic against the leading Manichee of Augustine's time.)

Augustine (400-16) *De trinitate (The Trinity)*, trans. S. McKenna, Washington, DC: Catholic University of America, 1962.(The last eight of this work's fifteen books constitute Augustine's most fully stated philosophy of mind.)

Augustine (401-14) *De genesi ad litteram (The Literal Meaning of Genesis)*, trans. J.H. Taylor, New York: Newman, 1982, 2 vols.(Augustine's commentary on Genesis includes important discussions of metaphysics and philosophical theology; the last treatise is a separate treatise on vision, including mystical vision.)

Augustine (412) *De spiritu et littera (On the Spirit and the Letter)*, trans. P. Holmes in W. Oates (ed.) *Basic Writings of Saint Augustine*, New York: Random House, 1948, vol. 1.(An attempt to argue that God's grace does not void free will, but rather grounds it.)

Augustine (413-27) *De civitate Dei (The City of God)*, trans. J. O'Meara, Harmondsworth: Penguin, 1972.(Several good English translations exist, of which the above is the most notable.)

Augustine (415-16) *De perfectione justicia hominis (On Man's Perfection in Righteousness)*, trans. P. Holmes and R.E. Wallis in P. Schaff (ed.) *A Select Library of the Nicene and Post-Nicene Fathers of the Christian Church*, First Series, 1886-8, vol. 5, 177-212.(A treatise on the accusations against Pelagius.)

Augustine (416) *In ioannis evangelium tractatus (Homilies on the Gospel of John)*, trans. J.W. Rettig, Fathers of the Church vols 78-9, 88, 92, Washington, DC: Catholic University of America, 1988-95.(Sermons on St John's Gospel arranged systematically so as to constitute a complete commentary on that gospel.)

Augustine (419-21) *De nuptiis et concupiscentia (On Marriage and Concupiscence)*, trans. P. Holmes and R.E. Wallis in P. Schaff (ed.) *A Select Library of the Nicene and Post-Nicene Fathers of the Christian Church*, First Series, 1886-8, vol. 5, 257-308.(A somewhat qualified defence of the good of marriage in response to the Pelagians.)

Augustine (421) *De cura pro mortuis (On the Care of the Dead)*, trans. J.A. Lacey, Fathers of the Church vol. 27, Washington, DC: Catholic University of America, 1955, 347-84.(A defence of burial services that raises interesting questions about ritual.)

Augustine (426/7) *Retractationes (Retractations)*, trans. M.I. Bogan, Fathers of the Church vol. 60, Washington, DC: Catholic University of America, 1968.(Augustine's efforts to review, in order of composition, all of his earlier works and, where he thinks it necessary, correct his earlier views.)

Augustine (429) *De praedestinatione sanctorum (On the Predestination of Saints)*, trans. R.E. Wallis in W. Oates (ed.) *Basic Writings of Saint Augustine*, New York: Random House, 1948, vol. 1, 775-817.(A final effort to insist that even the beginning of a believer's faith is God's predestined gift, though God does not act in human sin.)

Augustinianism

The influence of Augustine on Western philosophy is exceeded in duration, extent and variety only by that of Plato and Aristotle. Augustine was an authority not just for the early Middle Ages, when he was often the lone authority, but well into modern times. He was in many ways the principal author in contention during the Reformation and Counter-Reformation, and in France alone he was variously received by authors as diverse as Montaigne, Descartes, Malebranche, Arnauld and Pascal. The breadth of Augustine's influence makes it difficult to give precise sense to the term 'Augustinianism', even when considering only a single period.

Historians of medieval philosophy use the term 'Augustinianism' to describe three rather different relations to the thought of Augustine. The first relation is a comprehensive dependence on Augustine both for philosophical principles or arguments, and for instruction in the topics and procedures of ancient philosophy. Augustine serves as the trustworthy guide to philosophy as a whole. The second kind of relation is a defence of specific Augustinian teachings in the face of rival teachings, most especially those of Aristotle. These Augustinian teachings include the function of divine ideas in knowledge, the unity of the human soul's essential powers, and the unfolding of potential intelligibilities in material substances. The third relation is the reappropriation of Augustinian principles, especially those of his later writings, to address quandaries newly formulated with the tools of nominalist semantics and the mathematics of continuities. Among these quandaries are the contingency of future human actions and the certainty of human cognition.

These three relations to Augustine can be found in texts throughout the medieval period. They are not neatly correlated with particular centuries, but one or another does tend to be predominant at different times. Thus the first relation, of comprehensive dependence, is seen in the great majority of Latin writers on philosophic topics through the twelfth century. The second relation, of topical defence, appears prominently during the thirteenth-century contest between so-called 'Augustianians' and 'Aristotelians'. The third relation, of reappropriation in reaction to newly formulated quandaries, is found particularly in writings of the fourteenth century and beyond.

1 Scope

At face value, 'Augustinianism' would seem to refer generally to the teaching of Augustine or to one of the many adaptations of it. To use the term in this sense is to rob it of usefulness. The influence of Augustine on Western philosophy is exceeded in duration, extent and variety only by that of Plato and Aristotle. Augustine's writings served as authoritative works in the early Middle Ages, when he was often the sole philosophical authority referred to; the influence of Augustine is so pervasive in Latin Christian thought that any medieval Latin author on philosophic topics will show some borrowings from Augustine, and most of the best-known authors can be seen to engage him in sustained ways. Augustine was traditionally counted one of four 'Fathers' or 'Teachers' of the Latin-speaking Church, along with Jerome, Ambrose and Gregory the Great (see Patristic philosophy). His influence exceeded that of the other three in most theological areas and in all philosophical ones except for ethics, where Gregory's *Moral Readings on Job* provided more detailed if less systematic teaching about virtues. Further, the influence of Augustine can be seen well beyond the medieval period. During the Reformation and Counter-Reformation in the sixteenth century he was one of the principal authors referred to by both contending parties, and he was variously received by modern philosophic authors as diverse as Montaigne, Descartes, Malebranche, Arnauld and Pascal.

The term 'Augustinianism' can be made useful only by being applied to specific relations to Augustine. Three rather different relations have been used by historians of medieval philosophy. The first is a *comprehensive dependence* on Augustine, both for philosophical principles or arguments and for instruction in the topics and procedures of ancient philosophy. Second, there was a *defence* of specific Augustinian teachings in the face of rival teachings, in particular those of Aristotle (see Aristotelianism, medieval). Third, there was a *reappropriation* of Augustinian principles, especially those from Augustine's later works, in order to address quandaries newly formulated in the languages of nominalist semantics and the mathematics of continuities (see Nominalism; Oxford Calculators).

All three relations can seem to be progressively narrower or more restricted; indeed, it is tempting to understand

them as a sequence of comprehensive Augustianism, disputed Augustinianism and adapted or revivified Augustinianism. This conception of a sequence would be false in two important ways. First, it would ignore Augustine's permanent and unsurpassed authority in Christian theology, which provides so much of the context for medieval philosophy and, indeed, for modern European philosophy. Second, it would mislead one into thinking that philosophical interest in Augustine was at a low ebb at the end of the Middle Ages, whereas in fact Renaissance and early modern philosophy shows a striking resurgence of interest in Augustine. Any narrowing in the application of the term 'Augustinianism' should be imputed as much to the optical illusions of historiography as to the facts of reception. Contemporary historians of philosophy know more of philosophical writing before the thirteenth century than of what was written during or after that period, in large measure because there is so much more of the latter to know. Hence any narrative of medieval thought tends to become much more selective as it proceeds.

From the very beginning, Augustine's work was not easy to appropriate for philosophical uses. His body of writings is enormous and topical, not to mention contradictory in some of its details. Although there were early attempts to make his work both more accessible and more systematic, the interpretations of Augustine's writings depended very much on which works were being read. There was not always a choice in what to read. The reception of any author in the earlier Middle Ages depended on the hard facts of manuscript survival and distribution. In the cultural disarray that destroyed books and the means of producing them, Augustine was relatively fortunate; his works were copied steadily and widely. But to say that Augustine was frequently copied is not to say that he was uniformly copied. Not all parts of the Augustinian corpus were equally well known, and even in the thirteenth and fourteenth centuries certain Augustinian texts were much more rare than others. Thomas Aquinas revised a number of his opinions in mid-career, after coming into possession of texts of Augustine that he had not known before. The period 1325-35 in England also saw a sharp increase in commentaries on Augustine's knottiest writings, especially those of his later years.

Beyond problems of access there was also, and from early on, the problem of spurious works. Given Augustine's immense authority and his reputation for universal genius, it is not surprising that pious readers would attribute to him any number of works they admired. To extract the authentic works from this mass has been the labour of many centuries, a labour still unfinished with regard to some sorts of works, such as the homilies. These variations and uncertainties in the availability of Augustine's texts should be kept in mind through all that follows.

2 The reception of Augustine through the twelfth century

The first sense of 'Augustinianism' distinguished above refers to comprehensive influence exerted by Augustine on philosophic writers from his own time through the twelfth century. The most popular of his works not only set the terms and starting points for addressing many theological questions that were to vex early medieval authors, they also passed down precious information about ancient pagan philosophy and provided much-needed introductions to its teachings. Even after the conditions of learning had improved significantly in western Europe, Augustine continued to be followed as a sure guide through the confusing thicket of ancient philosophical debates.

Three examples can show the variety of relations to Augustine. The first is John Scotus Eriugena, who is best known for his technical command of late Greek Neoplatonism (see Neoplatonism). Some find in his work a turning away from the eclectic philosophy of Augustine, but it is just as possible to read Eriugena's *Periphyseon* as the incorporation of newer Neoplatonic elements within a framework that is deliberately and thoroughly Augustinian. Certainly Eriugena knew Augustine's work well, and just as certainly he engages the latter even when he disagrees with him.

The second, more obvious example is that of Anselm of Canterbury. In the prologue of his *Monologion*, Anselm explicitly submits his works to the test of conformity with Augustine. He advises readers to take Augustine's *De trinitate (On the Trinity)* as the measure of his own 'little work'. There is no irony or duplicity here. If Anselm goes on in his treatises to argue by reasoning alone, without frequent appeal to authorities, his arguments are still just so many variations on Augustinian themes. The famous definition of God used in the *Proslogion* to begin what came to be called the 'ontological argument' is Augustinian, and the argument's procedure follows closely several of Augustine's hierarchical arguments for the existence of God. Again, Anselm's analysis of truth as 'rightness' (*rectitudo*), however much it depends on more recent logical techniques such as the substitution of equipollent propositions, remains in its premises an Augustinian teaching about the communicative intention in language.

A final example of the comprehensive reception of Augustine in philosophy can be found in the work of Hugh of St Victor. Hugh is principally and formally a writer of theology, and he understands highest 'philosophy' to be the monk's prayerful contemplation of God. Hugh's works also rehearse a number of doctrines that are philosophic in a less exalted sense. These doctrines are drawn from many sources, but they are given shape after Augustinian patterns. In the survey of philosophical topics in the *Didascalicon,* Hugh quotes from a number of authors, including Boethius and his commentators, Cicero, Macrobius (see Encyclopedists §3), Calcidius and Augustine. The judgments on the right ordering of philosophy, as on particular philosophic doctrines, are taken for the most part from Augustine. If Augustine is invoked at times to supply some bit of learning about ancient philosophy, he is relied upon throughout in subordinating philosophy to Christian theology.

These two examples only begin to suggest the various relations between Augustine and later writers on philosophy. It should also be remembered that in the twelfth century, Augustine was the chief authority on theology. His works are given pride of place in Peter Lombard's influential theological codification, the *Sententiae in IV libris distinctae (Four Books of Sentences)*, and many of the topics under debate there are ones that Augustine would have recognized. Roughly the same is true in philosophy, despite the influx of newly translated Aristotelian works. A century later, however, Augustine's work was being increasingly challenged (see Lombard, P.).

3 The thirteenth century

The second sense of 'Augustinianism' distinguished above refers to the defence of particular Augustinian tenets against increasingly attractive Aristotelian alternatives. Indeed, some historians of medieval philosophy describe the principal philosophical developments from the middle of the thirteenth century onwards as a protracted contest between 'Augustinians' and 'Aristotelians'. They find evidence of the contest in a number of struggles within the universities of Paris and Oxford, and they see an important triumph for the Augustinian party in the condemnations pronounced at Paris and Oxford in 1270 and 1277. The 'Aristotelians', in this account, were not just the teachers of extreme positions in the Faculty of Arts but also, perhaps especially, Dominican theologians such as Albert the Great and Thomas Aquinas who approved some Aristotelian doctrines in philosophy and appropriated them integrally for theological use. By contrast, the 'Augustinians' were not just conservative masters of theology, but theologians who found the growing use of Aristotle damaging both to faith and to philosophy. Among the 'Augustinians' are usually accounted the Franciscans Alexander of Hales, Bonaventure and John Pecham. Because these controversies seem to have divided Dominicans from Franciscans, the quarrel of 'Aristotelians' and 'Augustinians' is often made into a quarrel between the two religious orders.

This way of describing the controversies makes caricatures of them. Augustine and Aristotle were in fact studied, quoted and defended by controversialists on both sides. Some of the best known 'Augustinians' spent considerable time explicating the text of Aristotle precisely in order to resist attempts to Christianize him, offering instead exacting interpretations of his original sense. More generally, Aristotelian terminology was used as the lingua franca by all members of the universities. On the other side, some of the leading 'Aristotelians' argued that the Augustine of their opponents was not the authentic Augustine at all, but a hyper-Platonist drawn largely from Islamic sources. As a result, great care should be taken when using the terms 'Augustianian' and 'Aristotelian' as designations for groups of medieval authors.

What is clear is that some of the Franciscan controversialists described themselves as defenders of Augustinian tenets in philosophy. They were quite willing to specify at least some of tenets they meant. In a letter of 1285, John Pecham wrote that he was not attacking the 'study of philosophers' so much as the 'profane novelties' of the 'Aristotelians'. These novelties are opposed to 'whatever Augustine teaches on the eternal rules and the unchangeable [intellectual] light, the powers of the soul, on the seed-like intelligibilities inserted into matter, and on innumerable other things like these' (Pecham, Letter of 1 January 1285). The three doctrines that Pecham mentions were indeed at the centre of the thirteenth-century disputes; they are known to historians of philosophy as doctrines of divine illumination, psychic essentialism and seminal reasons.

Augustine was understood to have taught that all knowledge worthy of the name was made possible only by the 'illumination', that is, by the intelligible presence of the 'divine rules' or 'divine reasons', God's own patterns for making creatures (see Augustine §10). On most readings, this did not mean that a human mind in the present life

could see the divine essence or could know something just by relying on divine illumination. Bonaventure, for example, is explicit that the presence of the divine ideas is ordinarily a necessary but not sufficient cause for cognition. By contrast, Thomas Aquinas argues that no ‘special’ illumination is required; the mind’s ‘participation’ in the divine light given at its creation is sufficient for ordinary cognition.

The second doctrine singled out by Pecham concerns the relation of a soul to its powers, such as reason and will. Some authors, claiming to follow Augustine, held that the soul’s powers were nothing more than its relations to various acts. Hence there could be no essential distinctions among the powers, which were all referred to the soul’s single essence. Other authors, following Aristotle, held that the soul’s powers inhered in the soul as accidents in a substance. In this view, the powers were essentially distinct. A third group attempted to split the difference; they held that the soul’s powers were only derivatively or analogically located in the category of substance. They should be considered as really different, not as essences are different, but as powers of a single essence can still be essentially different. Proponents of this third view, such as Bonaventure, thought that this was Augustine’s most careful teaching on the matter. Bonaventure also remarks that the debate is more curious than useful; none of the positions, he says, is opposed to faith or good morals.

The third disputed doctrine, that of seminal reasons, is adapted by Augustine from Stoic physics (see Stoicism §3). Knowing little of the genealogy, medieval readers held this doctrine as an affirmation of the completeness of divine creation and as an alternative to Aristotelian accounts of the pure potency of matter. They understood Augustine to teach that God had inserted into matter, at the moment of creation, intelligible patterns that could be actualized over time. So, for example, Bonaventure holds that the souls of non-rational animals and of plants were created not out of nothing nor simply out of some pre-existing matter, but rather ‘in the manner of a seed’. They were created, in other words, by actualizing an active potency in matter, which serves as a ‘seed bed’ of such potencies. After the moment of creation, animal souls are reproduced without divine intervention by the natural actualization of such ‘seed-like reasons’. These ‘reasons’ also contain the latent forms of certain lower-order substances which are produced by the corruption or commingling of other specific forms. In this way, every kind of form that would sometime attain actuality was put into the created world at the beginning.

Pecham’s letter also alludes to other doctrines disputed between the followers of Augustine and their adversaries. Principal among these were two, the plurality of forms and the universality of the form-matter distinction. The teaching on the plurality of forms, to which Pecham was particularly attached, held that multiple forms could exist in a single substance without having to be reduced to accidents of a single substantial form. This teaching was particularly important in analysing the relation of human souls and bodies. Pecham thought it nonsensical to say that the separable, immortal soul was the single substantial form of the body-soul composite. As to the other point, defenders of Augustine taught that something properly called a form-matter distinction could be found in all creatures, including the incorporeal substances known to theology as angels. If this ‘spiritual matter’ was not identical with ordinary matter, it was nonetheless a material principle.

Pecham’s version of Augustine can be found in other writers, if not so emphatically articulated. His Augustinian programme is in some ways more retrospective than prospective. Already by Pecham’s time, Augustine was being appropriated in more subtle and novel ways by a new group of authors, most notably Henry of Ghent. From Henry through John Duns Scotus and William of Ockham, one can trace profoundly original transformations of Augustinian principles and problems. Indeed, Scotus and Ockham have been counted, in their very different ways, as a second ‘school’ of Franciscan Augustinians. Here, however, the term ‘Augustinianism’ begins to become much too diffuse to be useful.

A more specific ‘Augustinianism’ is sometimes claimed for the writers of the religious order of Augustinian friars. The order was organized out of existing communities between 1244 and 1256, and its constitutions were ratified in 1290. Some historians have wanted to see in this order an institutional home for an ‘Augustinian’ school of philosophy and theology, but the matter is not so simple. Giles of Rome, first Parisian master from the order and later its Prior General, was a student of Thomas Aquinas. He often appears in narrative histories as an ardent if somewhat inexact Thomist. In fact, he differs from Thomas on a number of points, such as the nature of the essence/existence distinction and the plurality of substantial forms. For these reasons among others, Giles was claimed by later members of the Augustinian order as founder of a ‘school’ of thought (the *schola Aegidiana*) which those members understood themselves to be continuing. But Giles was hardly a programmatic Augustinian

in philosophy, and the most interesting philosophical adaptations of Augustine at the end of the thirteenth century were happening outside the Augustinian order.

4 The fourteenth century

The third relation to Augustine distinguished above is the most difficult to characterize. It combines motives of textual fidelity with motives of reappropriation. Textual fidelity led to an intensive re-reading of Augustine, culminating in Oxford during the second quarter of the fourteenth century. Reappropriation stemmed from the desire to respond to the sea-change in philosophy marked by Scotus and Ockham. The most prominent fourteenth-century Augustinians wanted to understand and to rehabilitate Augustine's central teachings in response to the quandaries produced by the 'modern way' in philosophy; some of these writers, notably Thomas Bradwardine, are distinguished by their willingness to restate difficult Augustinian principles against accepted conclusions of the latest semantics and the mathematical analysis of nature. Other writers are marked out by their fidelity to Augustine across a range of topics and in the face of the increasingly popular alternative ways of thinking; the most famous of these is Gregory of Rimini.

Bradwardine was prominent among the Oxford 'Calculators', a group of Masters of Arts centred in Merton College, Oxford, during the 1320s and 1330s (see Oxford Calculators). He wrote important works on logical quandaries and on proportions. While at Oxford, Bradwardine also wrote what is counted a centrepiece of fourteenth-century Augustinianism, *Summa de causa Dei contra Pelagium et de virtute causarum (On God's Cause against Pelagius and on the Power of Causes)*. The work is, as its title proclaims, a polemical one, written against certain 'new Pelagians' (see Pelagianism). Bradwardine seems to refer by this epithet to some of his Oxford contemporaries, perhaps especially Richard Fitzralph, Robert Holcot, Adam Wodeham and Thomas Buckingham. He accuses them of denying all of God's providence, cooperation, conservation and predestination with respect to creaturely activity. Denying these things, Bradwardine's Pelagians effectively deny the existence of God, because they deny that God is God. Against them, Bradwardine offers 'the grace of God, which precedes all good merits with a priority of both time and nature; I mean the gracious will of God, prior in both these ways, which wills to save the one who merits it, and naturally produces merit in him even before he does, just as He is the first mover in all motions.' This Augustinian doctrine came to Bradwardine in a moment of intellectual conversion, which he explicitly links to Augustine's narrative in the *Confessiones*.

Though Bradwardine confronts the Pelagians on a number of fronts, his sharpest and most technical attack comes in considering the problem of future contingents. This problem had been much debated in Oxford for several decades. Bradwardine considered it the crucial case for the Pelagians - and the one that revealed the depth of their error. According to Bradwardine, the new Pelagians held that while singular propositions about future contingents always possessed a determinate truth, the contingents were themselves not determined. A truth about them could become false. By contrast, the truth of propositions about present events was fixed, and the truth of propositions about past events was necessary. It might seem a long way from Bradwardine's Augustinian conversion to these logical issues, but the way is in fact quite short. Views on the truth of future contingents had immediate consequences for the question of divine foreknowledge and, indeed, on such specific topics as the truth of prophetic revelations about future events. For Bradwardine, the Pelagians' doctrines concerning the mutability of future contingents denied both the immutability of divine knowledge and the honesty of divine revelation. If the truth of propositions about the future is different from the truth of propositions about the past, then the character of God's knowledge must change with time; and if the truth of a specific proposition about a future event is contingent, then a prophecy of that event can be falsified. Bradwardine finds both conclusions monstrous. The first makes God into a creature; the second, into a deceiver. Bradwardine teaches, on the contrary, that all future events are necessitated in respect to higher causes, though some of them may be understood to be free in present time with respect to lower causes. This position is, on Bradwardine's reading, precisely that of Augustine.

With Gregory of Rimini, one may begin to speak of an Augustinian school within the order of Augustinian friars. He was elected Prior General of the order in 1357 after a distinguished teaching career in Paris and Italy. Gregory's appropriation of Augustine is wider and more nuanced than Bradwardine's. A sample can be had in Gregory's discrimination among the types of human knowledge. He agrees with Ockham in criticizing the pretensions of empirical knowledge, and he is equally firm in advancing the claims of introspection, which he describes by citation from Augustine's *De trinitate*. More strikingly, Gregory claims that intelligible knowledge

depends upon certain innate ideas that direct the soul to its cognitive and moral end. His explicit source here is Augustine's *De libero arbitrio (On Free Choice of the Will)*. In these and other instances, Gregory aligns problems or models from the most recent philosophy with principles retrieved from Augustine.

It is difficult to assess the immediate influence of Thomas Bradwardine or Gregory of Rimini without deciding how far they contributed to the heterodox reform movements that would eventually lead into the Reformation. A case in point is John Wyclif, who invokes Bradwardine as one of his intellectual masters. Indeed, the study of Augustinianism shows with particular clarity how arbitrary is the division between late medieval and early modern philosophy. The culmination of the medieval relations to Augustine's philosophical texts is not to be found in the Middle Ages; the conclusion comes in the sixteenth and seventeenth centuries, in the Reformation and in the genesis of several of the most important philosophical movements of early modernity, including Cartesianism and the philosophy of the Jansenists.

Aureol, Peter (*c.*1280-1322)

A master of theology at the University of Paris and a member of the Franciscan order, Peter Aureol helped shape the philosophical agenda of the fourteenth century. His original and provocative views were widely discussed during the later Middle Ages, but his influence was rather indirect since his views almost always met with hostility. Although Aureol wrote extensively on a wide range of philosophical and theological issues, his most-discussed contributions to philosophy, in epistemology and metaphysics, centre on his theory of esse apparens *(apparent existence).*

Aureol, known as the *Doctor facundus* (Fluent Doctor), was born near Gourdon in the south of France. He seems to have joined the Franciscan order in his teens, and to have studied at Paris, perhaps in 1304. There has been speculation that he was a student of John Duns Scotus at that time, but there is little evidence for the claim. Aureol's magnum opus, his *In quatuor libros Sententiarum (Commentary on Peter Lombard's Sentences)*, began taking shape in his lectures at Franciscan houses of study in Bologna (beginning in 1312) and Toulouse (in 1314). In 1316 he was sent to Paris to continue his lectures, and he remained there until 1320, becoming regent master in 1318, lecturing on the Bible, and completing a single quodlibetal question. He became an archbishop in 1321, and died shortly thereafter.

Aureol thoroughly edited the first book of his *Sentences* commentary, and this so-called *Scriptum*, together with the other parts of his commentary (the less polished *Reportationes*), constitute Aureol's most significant philosophical work. In it, he ranges widely over the theological and philosophical problems of his day, making interesting and original suggestions about the relationship between soul and body, the nature of grace and justification, and the status of future contingents and divine foreknowledge, among many other topics. However, the issues that have drawn most attention are those that surround his theory of *esse apparens* (apparent existence), a kind of non-real, merely apparent existence that is the key to Aureol's theories of universals, perception and conceptual thought.

Aureol first alludes to this *esse apparens* when he takes up Duns Scotus' distinction between intuitive and abstractive cognition (*Scriptum* pro. s.2). This distinction applies at both the intellectual and sensory levels, and is most easily described by examples: imagination (in the absence of the imagined object) counts as abstractive cognition, for instance, whereas ordinary sense perception is one kind of intuitive cognition. But although the extension of these categories was relatively uncontroversial, it proved much more difficult to give a general account of what distinguishes intuitive from abstractive cognition. Duns Scotus claimed that intuitive cognition takes as its object something that is present to the cognitive agent. Aureol objects to this claim by describing various cases of non-veridical perception, such as after-images and double-vision, where there is no object corresponding to what is being perceived. These should all be counted as instances of intuitive cognition, Aureol argues, and he goes on to claim that this sort of empirical evidence should be taken more seriously than any logical argument that might be put forward. In opposition to Scotus' proposal, Aureol suggests that intuitive cognition, at both the sensory and intellectual levels, be defined as cognition that is direct (not inferential), and that makes the object appear present, actual and existent.

These claims naturally lead Aureol to raise more general questions about perception, and in particular to ask how perception is able to make an object appear present, whether or not it is actually present. His answer is that the senses give the object apparent existence. (He also speaks of this as *intentional* existence.) When a stick is swung rapidly in a circle, something circular appears. There is nothing circular that really exists, because the appearance is there only for as long as someone is watching. However, Aureol insists that the appearance, this apparent entity, exists in the very place where it appears to exist. It is not in the eye or the brain, nor anywhere in the intervening air. (Aureol does incorporate sensible and intelligible *species* into his account, but he attributes real existence to them, not apparent or intentional existence, and he takes them to be pure intermediaries which are never themselves the objects of cognition.) Aureol uses these illusory cases to establish a general theory of perception: all perception involves the formation of *esse apparens*, but it is illusions that point to the true nature of perception, because ordinarily we can't distinguish *esse apparens* from *esse reale*: 'In the case of true vision they occur together' (*Scriptum* d.3 s.14 a.1).

Aureol gives a similar account at the intellectual level. Indeed, he explicitly defines cognition, sensory and intellectual, as 'having something present as an appearance'. Thus if a picture of Caesar on a wall were to make Caesar appear to that wall, then 'the wall would be said to be cognizing Caesar' (*Scriptum* d.35 a.1). At the intellectual level, an apparent entity exists within the intellect, and is in fact the focus of intellect's attention (*Scriptum* d.9 a.1; d.27 a.2). Aureol thinks that he can make this claim without epistemological difficulties, for he stresses in many places that it is the object itself that has apparent existence within intellect. One's concept of a rose is not distinct from the thing itself in the external world. It just is that rose, in *esse apparens*: thus 'the objects are cognized directly' (*Scriptum* d.3 s.14 a.3).

These considerations form the basis for Aureol's conceptualist theory of universals (*II Reportationes* d.3 q.2; d.9 q.2). Nothing outside mind is universal; mental concepts are universal only in the sense that some concepts have a less determinate content than others. Indeed for Aureol, 'everything, inasmuch as it is, is singular'. Individuation is a primitive feature of reality, and so 'to seek that through which a thing outside the intellect is singular, is to seek nothing' (*II Reportationes* d.9 q.2). However, Aureol's position seems readily distinguishable from nominalism because he rejects the view that mental concepts might merely *denote* objects in a certain indefinite and universal way (see Nominalism §§1-2). Mental concepts, as universals, are more than mere representations, because they *are* the objects, in *esse apparens*.

Leroux.(The most detailed study of Aureol's thought in these areas.)

Aurobindo Ghose (1872-1950)

Aurobindo Ghose was a leading Indian nationalist at the beginning of the twentieth century who became a yogin and spiritual leader as well as a prolific writer (in English) on mysticism, crafting a mystic philosophy of Brahman (the Absolute or God). Aurobindo fashioned an entire worldview, a system intended to reflect both science and religion and to integrate several concerns of philosophy - epistemology, ontology, psychology, ethics - into a single vision. Of particular importance to his cosmological thinking was evolutionary biology. But Aurobindo also understood the fundamental nature of matter to include - for metaphysical reasons - an 'evolutionary nisus' that ensures the emergence of individuals capable of mystical experience in which the supreme reality, Brahman, is revealed.

1 Life

Commonly referred to as Aurobindo, or, by followers, as Sri Aurobindo ('Sri' is honorific), Aurobindo Ghose was born in Calcutta. He spent fourteen years in England from the age of seven until graduating from King's College, Cambridge University. He died surrounded by disciples in the French colony of Pondicherry in South India.

Aurobindo's politics were not of the passivist variety later endorsed by Gandhi. He used the editorial columns of the nationalist newspaper *Bande Mataram (Hail to Mother India)* to call rather openly for open rebellion. Arrested on charges of sedition and then 'waging war', he spent a year in prison before being acquitted in 1909. Still harassed by the British authorities, he retreated to Pondicherry, retired from politics and wrote voluminously while practising meditation and yoga. In addition to his metaphysical writings, Aurobindo wrote an epic poem (*Savitri*, one of the longest in English) and works on psychology, political philosophy, ethics, culture and yoga.

2 Metaphysics

Aurobindo puts forth in *The Life Divine*, his principal work of philosophy, a thoroughly realist metaphysics: there is an essential God or Brahman (the two terms are with Aurobindo roughly interchangeable) and real physical objects - transcendent in the sense of existing independently of our experience - with much intermediate to these two 'poles of being'. He couples his realism with an empiricist epistemology that brooks no illusory element. Illusions and misperceptions are analysed as false combinations of presentations of realities. Objects stand in causal relations to perceivers, though causal media vary. Aurobindo defends an epistemic parallelism between the indications of sensory and mystical experiences, with the latter carrying most of the weight regarding the existence and nature of Brahman - although variations on teleological, cosmological and other arguments of rational theology are presented too. Aurobindo's realism is not unreflective; he considers and rejects several varieties of phenomenalism, including Buddhist and Vedāntic theories that use a phenomenalist understanding of sensory objects to defend the possibility of enlightenment experiences held to be a supreme personal good. Aurobindo endorses such possibilities of enlightenment (*nirvāṇa*, for example), but proposes that his realist views provide better explanations both of mystical experiences and of our everyday world. There is tension, in Aurobindo's metaphysical writings, between a mystical foundationalism, Aurobindo's sense of the veridicality of yogic experiences, and a speculative theology, a sense that Brahman as the Absolute cannot be perfectly known.

Throughout *The Life Divine*, Aurobindo weaves a view of a 'self-manifesting Brahman' with close attention to an overall coherence of theory. Brahman - in essence perfect Being, Consciousness-Will and Bliss or Value (so Aurobindo renders a traditional characterization of Brahman as *saccidānanda*) - involutes aspects of itself - that is, contracts - so that certain finite possibilities can emerge, a process that has an outer limit in the 'inconscient' energies of matter. But such apparent inconscience cannot remain because it is nothing but Brahman. Conceivable universes that are incompatible with Brahman's essential nature are strictly impossible. Thus conscious beings are destined to evolve. In other words, God (that is, Brahman) works within limits, and could not, for example, make 2 + 2 = 5. God cannot create an entirely insentient world since God is constrained by the metaphysical law *ex nihilo nihil fit* ('nothing from nothing') to create out of God's own nature of Consciousness and Bliss. Thus this world is destined to evolve sentient material beings and eventually a divine life conceived as a society where many have experience of Brahman.

3 Views on evil

Evil, which is rooted in the insentience of matter and the limitations it imposes on life (the converse of valuable possibilities it secures), is fated to diminish and even disappear as evolution proceeds - possibly past the human species. The future evolution that Aurobindo envisages is the working out of a divine intention in which human effort, however, has a crucial role. Humans have developed a sufficient measure of freedom and self-determination to further the evolutionary progression, as divine delegates as it were. In a second, revised and expanded, edition of *The Life Divine* (1943-4), Aurobindo elaborates his theory of individual progress, amplifying a mystical psychology and enlarging on a theory of rebirth. Brahman's self-manifestation includes other 'worlds', or 'planes of being', said to be accessible to us in a mystic trance and which the developing divine individual ('psychic being' or 'soul') is said to enter upon the death of the body. The material universe does not exhaust the manifestation of Brahman, but it is, Aurobindo claims, the only evolutionary world. The others are 'typal', with no evolutionary emergence. In this world, the soul, profiting from all its experience, develops an increasingly refined and finely etched personality in terms of body, life and mind. The value of this development discounts, Aurobindo reasons, the evil made possible and even necessary by the insentience of matter inasmuch as matter makes possible such an evolutionary world.

4 Relation to classical Vedānta

Aurobindo manages an extraordinary consistency; critics have tended to fault him not for tensions among his many claims but for wrongly weighing 'mystical data'. Though little known in the West, his system enjoys in India significant influence both among professional philosophers and a larger intellectual community.

The speculative originality evident in Aurobindo's intricate theodicy and theory of evolutionary progress sets his system apart from classical Vedānta, the traditional Hindu philosophy based on sacred texts (principally Upaniṣads and the *Bhagavad Gītā*). But Aurobindo also relies heavily on these works. He says he understands them as records of mystical experiences similar to his own, not as mainstays of a revealed tradition. Critics, particularly in India, have often misunderstood Aurobindo's approach to traditionally sacred texts, viewing his philosophy as Neo-Vedānta and fuelling worries that Aurobindo, like all mystics perhaps, is ethnocentric in his claims. But despite the distancing from traditional Hinduism, such worries about cultural shaping remain (see Mysticism, nature of §3).

Western influences on Aurobindo's thought have not been adequately studied. Platonic and Neoplatonic reverberations abound, and there are echoes of Hegel and Nietzsche. Aurobindo read widely in Western literature (he won prizes in Classics at Cambridge) as well as in Sanskrit, which he learned through English, in effect his mother tongue. A hero of the Indian nationalist movement could be expected to cast his thought in the rich philosophical terminology of the classical Sanskrit tradition (consider also the case of Gandhi). But Aurobindo's inspirations were arguably as much Western as Indian. There is also with Aurobindo, as with all great thinkers, an element of creativity that transcends cultural precedent.

Austin, John (1790-1859)

Although written in the early nineteenth century, Austin's is probably the most coherent and sustained account of the theory of legal positivism. The complex relationships between legal positivism and the concepts of morality and politics are explored by him but are often neglected or misunderstood in modern commentaries.

John Austin became in 1829 the first Professor of Jurisprudence at the newly established University of London, having previously spent a brief spell in the army, followed by a somewhat longer period of work in barristers' chambers as an equity draftsman. In preparation to take up his chair, he spent two years studying in Bonn, acquainting himself with classical Romano-German legal science. A neighbour of James Mill and Jeremy Bentham, he was much of their intellectual circle, and had John Stuart Mill as a student. His main work was a systematic explanation of some basic social concepts in terms which have been received as the classical statement of 'legal positivism', according to which law is dependent on the will of superior(s) over inferior(s) (see Legal positivism §2).

Austin wanted all lawyers to commence their studies with the cognitive sciences, logic and ethics. Politics and the study of law were seen by him as subcategories of ethics. More than half of his introductory series of lectures was given over to an exposition of the principle of utility - seen either as the index to the laws of God, or as the rational basis of ethics (see Utilitarianism).

He said that all laws (apart from scientific laws) were set to intelligent beings by intelligent beings, having power over them. There are two basic types of laws - those set by God for people and those set by people for others. Of the laws set by God, Austin said that he would normally call these 'natural' laws, but as this word is likely to be confused with aspects of sociology, he would instead call them 'divine' laws. He recognized that 'non-believers' would prefer the word 'ethics'. On either view, these provide the standard by which all other laws should be judged. Many modern positivist scholars think that positivism and natural law are opposed to each other - not so for Austin.

Austin said that of laws set by people there can also be two types - those set by them as political superiors (positive law) and those set by them in other capacities (positive morality). Having set out the basic categories of ethics, positive law and positive morality, Austin went on to explain their common and distinctive features. They have in common the concepts of 'commands', 'duties' and 'sanctions'. The intelligent being or person lays down some *general* rule for the guidance of human conduct. If it is not complied with, the maker of the rule can exact some *detriment* for non-compliance.

The distinctive features of 'positive law' (the law of the state) are that it comprises rules made by 'sovereigns' addressed to 'subjects' within an 'independent political society'. While these ideas are scorned by most contemporary legal theorists, they remain fundamental in international politics and foreign affairs policy. Austin made it clear that the study of politics is logically and socially prior to the study of state law. Without political stability there is no state, and without the state no law of the state. The most contentious aspects of Austin's views were his claims that 'sovereigns' cannot be *bound* by state laws, and that the 'laws' operating between states would be better viewed as 'international positive morality'. Both points relate to the role of coercion, assuming that the author of a coercive law cannot, logically, also be subject to it, and that state boundaries limit the enforceability of state laws, but not necessarily their range of application (see Sovereignty §§2, 3).

Some suggest that his separation of the concepts of positive (state) law, positive (existing or customary) morality, and ethics (the critical base), entails that the positive law can be understood or implemented without understanding its relationship to the other factors. This is plainly wrong.

There has been much debate about this 'separation of law and morality'. Most writers on the topic forget that Austin said - 'Positive law (or *jus*), positive morality (or *mos*) together with the principles which form the test of both, are the inseparably connected parts of a vast organic whole' (1861-3: 17). An unfulfilled project of his was to write a book on *The Principles and Relations of Jurisprudence and Ethics*. It follows from Austin's analysis that as we are dealing with three types of rules there are also three types of duties as well as three types of commands and sanctions. Austin said that if there should be any conflict between the duties of positive law and the duties of

ethics or divine law, then because the sanctions which God could impose would greatly outweigh those which could be imposed by the human makers of positive law, it would accord with the principles of utility to act in accordance with the natural or divine law and not the law of the state.

The law of the state, he said, had its basis in the positive morality of the wider community, and should be guided in its development by the positive morality of the legal and international communities.

Austin had no time for 'the childish fiction employed by our judges, that judiciary law or common law is not made by them, but is a miraculous something made by nobody, existing, I suppose from eternity, and merely declared from time to time by the judges' (1861-3: 634). He explains at some length how it is that judges *make* the law rather than just find it, and entitles chapters 35-9 of his *Lectures* 'Judicial Legislation'. In its conceptual aspects, Austin's approach influenced the work of people such as W.N. Hohfeld, and in its social aspects has much in common with the writing of the later legal realists (see Hohfeld, W.N.; Legal realism).

Austin's strongest supporter was his wife Sarah, who was accomplished and well known in the intellectual circles of London and Paris, and with a number of important translations to her credit. As a teacher, Austin was not conspicuously successful, and his periods of formal academic employment were quite brief, at the University of London (1829-33) and at the Inns of Court in London (1834). He also worked with the British Criminal Law Commission (1833) and for a short period as a Commissioner to the Royal Commission on Malta (1836-8).

ROBERT N. MOLES

List of works

Austin, J. (1832) *The Province of Jurisprudence Determined*, London: John Murray; with intro. by H.L.A. Hart, London: Weidenfeld and Nicolson, 1954; with intro. by W.E. Rumble, Cambridge: Cambridge University Press, 1995.(The only book to be published by Austin in his lifetime, being a series of six lectures originally delivered as ten. It states his central tenets in clear terms, and has remained a focus of controversy, and of frequent attempts at refutation, more or less since its first publication. The 1995 edition includes a good bibliography.)

Austin, J. (1859) *A Plea for the Constitution*, London: John Murray.(This is the best known and most significant of Austin's later pamphlets; it is a forceful statement of opposition to radical reform of the franchise, based on the idea that habitual or customary acceptance of a constitutional order is the foundation of a stable polity and thus of law.)

Austin, J. (1861-3) *Lectures on Jurisprudence or the Philosophy of Positive Law*, ed. R. Campbell, London: John Murray, 5th edn, 1885.(This is the complete statement of Austin's views and of his legal-conceptual analyses, based on his London lectures. The two volumes were first published from his working papers as edited by Sarah Austin. First and subsequent editions contain the most moving piece about Austin's life, in the Preface written by Sarah.)

Austin, John Langshaw (1911-60)

J.L. Austin was a leading figure in analytic philosophy in the fifteen years following the Second World War. He developed a method of close examination of nonphilosophical language designed to illuminate the distinctions we make in ordinary life. Professional philosophers tended to obscure these important and subtle distinctions with undesirable jargon which was too far removed from everyday usage. Austin thought that a problem should therefore be tackled by an examination of the way in which its vocabulary is used in ordinary situations. Such an approach would then expose the misuses of language on which many philosophical claims were based.

In ‘Other Minds’ *([1946] 1961), Austin attacked the simplistic division of utterances into the ‘descriptive’ and ‘evaluative’ using his notion of a performatory, or performative utterances. His notion was that certain utterances, in the appropriate circumstances, are neither descriptive nor evaluative, but count as actions. Thus to say ‘I promise’ is to make a promise, not to talk about one. Later, he was to develop the concepts of locutionary force (what an utterance says or refers to), illocutionary force (what is intended by saying it) and perlocutionary force (what effects it has on others).*

1 Life and early period

John Langshaw Austin, a graduate of Balliol College, Oxford, was successively a Fellow of All Souls’ (1933) and Magdalen Colleges (1935) at Oxford until appointed White’s Professor of Moral Philosophy in 1952. He was a distinguished Intelligence Officer in the Second World War, latterly at Supreme Headquarters, Allied Expeditionary Force, being awarded the OBE, the Croix de Guerre and made an Officer of the Legion of Merit.

In the pre-war period Austin worked mainly on the history of philosophy, particularly on Aristotle and Leibniz, though publishing nothing on them. He was a caustic observer of the contemporary scene, as is clear from his only pre-war publication, the devastating, amusing and wholly negative paper ‘Are There A Priori Concepts?’ ([1939] 1961), but as yet he spoke with no clear voice of his own. He himself regarded his later work as quite different from anything he had done before the war.

2 Analysis of ordinary language

During his five years absence on military service Austin’s thought matured, and on returning to Oxford in 1945 he immediately became a leading force in philosophy there and, soon after, in analytic philosophy throughout the world. His work was based on three convictions.

(1) Ordinary language, by which is meant language other than that of philosophy, as the tool of communication, contains all the distinctions about the world that people have found it necessary to make - not, of course, all that can be made. As such, he thought, while it was not perfect, it was a much more powerful and subtle tool of thought than philosophers had traditionally recognized. What, for example, philosophers have hastily treated as synonyms, would usually be found on careful examination to mark distinctions that might be important. Where synonyms arose, the daily use of language would usually lead either to the abandonment of one or the development of a distinction in their employment.

(2) Philosophers consistently misused and abused ordinary language, blurring and perverting the distinctions it made. When they abandoned ordinary language in favour of a technical vocabulary of their own it was usually confused and imprecise, creating confusion and darkness rather than shedding light. Thus they neglected and damaged the powerful tool available to them in ordinary language in favour of a less efficient one; no wonder that little headway was made in answering the problems they tried to solve.

(3) While holding that much philosophical work was full of confusion, Austin did not, however, share the view that the sole task of the philosopher was to expose these confusions and to ‘show the fly the way out of the fly-bottle’ (see Wittgenstein, L. §17). He thought that progress could be made, and that philosophy could shed light as well as clear away fog. But this required slow and careful labour, especially including a thorough examination of the vocabulary available and used in the area where the problem arose, long before asking the huge and assault-defying major questions.

Some have wrongly thought that Austin believed that his way of working in accordance with these convictions was

the be-all and end-all of philosophy; this he denied, though he said that it might be the begin-all. But he once gave the title ‘One way of possibly doing one part of philosophy’ to an unpublished talk, and he ascribed his lack of use of more formal procedures to ignorance.

Most of Austin’s work based on these convictions was carried out in discussion and in lectures. He believed that his sort of work on language was best done by groups working together. He himself published only a handful of papers, never spontaneously, but almost always at the request of the Aristotelian Society and for symposia, the subjects of which were often not of his choosing. But from these, together with posthumous publications, it is possible to illustrate how his fundamental ideas were employed.

In his posthumously published lectures entitled *Sense and Sensibilia* (1962a) (Austin parodying Austen), he is mainly concerned to illustrate the second conviction above. He looks closely, very closely, at the invented philosophical terminology for discussing the problems of perception - terms such as ‘sensum’, ‘sensibile’ and ‘sense-datum’ - and also at the use (or, as he thought, abuse) by philosophers of such existing terms as ‘illusion’, ‘delusion’, ‘look’, seem’, ‘appear’ and ‘veridical’ (see Perception §1). Thus, for example, philosophers had tended to treat ‘look’, ‘seem’ and ‘appear’ as synonyms, which, he tries to show, they are not. The argument from illusion, he said, gained virtually all its force from misuse of words. That, for example, the fact that a penny looks elliptical from certain angles is part of our evidence that it is round, not an illusion that suggests that it is not round. He uses A.J. Ayer’s book *The Foundations of Empirical Knowledge* (1940) as his main illustrative text, attempting to show that Ayer’s problems are largely of his own making and result from abuse of language (see Ayer, A.J. §3). In his paper ‘Other Minds’ ([1946] 1961) he similarly seeks to show that much scepticism about the possibility of knowledge was based on continuing to use the word ‘know’, but with impossibly stringent criteria of application quite different from those of ordinary speech. If we cannot know according to criteria we never use, what then? In this paper Austin also insists that if, having made a claim to knowledge in circumstances which would normally be considered to provide complete justification for the claim, some freak circumstance arises (in Austin’s example, what the experts agree to be a goldfinch explodes or quotes Virginia Woolf), we should not naturally agree that the experts were wrong, but rather admit that words fail us. Language makes no provision for circumstances which do not in fact arise.

His more constructive work in this field is to be found in some of his papers. Thus there is the traditional problem of the nature of action. Austin was sure that to plunge in at the deep end by asking ‘What is an action?’ was mere folly. The way to start was by a close examination of the language ordinarily used for discussing action; a sub-area of this vocabulary is that which is concerned with the defects that actions may exhibit; they may, for example, be unintended, mistakes, inadvertences, involuntary or clumsy (see Action §5). As a deliberate illustration of his general ideas, he set out to examine some of these terms in a paper called ‘A Plea for Excuses’ ([1956a] 1961). His technique, as usual, was to take a real or imaginary situation and ask what we should say about it. Thus, take a situation in which you and I keep a donkey each in the same field and I, wishing to shoot mine, instead shoot yours. If I (a) fire accurately at your donkey, thinking it is mine, or (b) fire at mine, but the bullet ricochets and hits yours, which, if either, would you call a mistake or an accident? Or are the terms interchangeable? Austin had an unusual facility for bringing out differences which we implicitly observe in our daily use of language, but which we do not ordinarily make explicit and which we may fail to notice in philosophical discussion. ‘A Plea for Excuses’ also contains a short but illuminating account of his methods of work at a more general level.

Another important illustration of this aspect of Austin’s work is the paper ‘Ifs and Cans’ ([1956b] 1961). Here he typically approaches the problem of the freedom of the will by a careful examination of such expressions as ‘I could have…’ and, especially, ‘I could have if I had chosen…’, rather than by an immediate attempt on the big question (see Free will §§1-2). He brings out defects in the account given by G.E. Moore in his *Ethics* (1912), and by others, of the way such expressions are used in real life. Notably he brings out the inadequacy of the traditional accounts of hypotheticals. In the sentence, ‘There are biscuits on the sideboard if you want some’, for example, the truth of the conseqent should not be taken to follow from the truth of the antecedent. What is the force of ‘if I choose’? Does it give a necessary or sufficient condition of one’s being able to act, or does it function in some way more similar to that of ‘if you want some’ in the example above?

3 Philosophical linguistics

Austin thought that ordinary language did not provide us with ready-made distinctions for use in discussing the

nature of language, and that many of the technical terms already existing in philosophy were ill-suited to this purpose. Here was an area in which he thought that technical terms were necessary, not as a substitute for existing linguistic resources, but as a supplement to them. One of his most disliked targets was the distinction commonly made between the descriptive and evaluative uses of language, which he thought to blur a host of more effective distinctions that needed to be made. He started to remedy the situation by drawing attention to what he first called the performatory, later the performative, use of language. It was introduced in the paper ‘Other Minds’ with great brevity; a performative utterance is typically couched in an indicative sentence but is neither a description nor an evaluation, nor is it true or false; rather, one utters a formula or performs a ritual in appropriate circumstances which itself counts as the performance of an act which would not be naturally regarded as a linguistic act, provided that the utterer is in a position to make the utterance. Thus to say ‘I promise’ is to make a promise, not to talk about one, and to say ‘I name this ship "Generalissimo Stalin"’ is, if one is a duly authorized person, to give a ship a name. There are many types of action that can be best performed by such specified formulas, such as making contracts, making appointments and christening. Making a promise, for example, is more like shaking hands over a bargain in a recognized context, than describing anything whatsoever (see Performatives).

In his posthumously published William James Lectures, *How to Do Things with Words* (1962b), based on earlier lectures given at Oxford over a series of years with the title ‘Words and Deeds’, Austin set out to provide an ambitious classification of types of force of linguistic utterances on a far wider scale. Thus at a higher level he distinguished between different types of force, such as locutionary, illocutionary and perlocutionary force. The locutionary force is roughly the sense and reference of the utterance, the illocutionary force is what one is doing in making an utterance with a given locutionary force, and the perlocutionary force is the effect that is intended to be achieved by an utterance with a given illocutionary force. Thus the locutionary force of ‘The bull is charging’ is simply the predication of something of an animal; the illocutionary force may be that of a warning, a comment on the scenery or an exclamation; and if the illocutionary force is that of warning, the perlocutionary effect intended may well be to make somebody run for it. Not all these forces are always present; I may utter a sentence without even locutionary force merely to test a microphone or to give an example in a philosophical paper. So Austin further distinguishes the merely phonetic act of making a noise vocally and the phatic act of uttering an intelligible sentence (as when I say ‘The bull is charging’ merely to test a microphone) from each other and from the other forces (see Speech acts §1).

These and other distinctions have been widely used, sometimes with modifications, and also, needless to say, widely criticized (for example, Searle 1969). Their influence is apparent in theoretical linguistics as well as in philosophy. What is certain is that this work has had profound effects on philosophical linguistics. One notable feature is the way that Austin chose to present his classification of utterances as arising from a criticism and, eventually, the abandonment of the performative as a special type of utterance and its subsumption under the doctrine of illocutionary forces. Thus what had been counted as the action performed by the utterance of a performative now becomes the illocutionary force of that utterance, and the performative is no longer treated as importantly different from other speech acts having an illocutionary force. This may accurately reflect the historical development of Austin’s views, but it appears to some to involve a denaturing of the performative (Warnock 1973; Urmson 1977). In particular Austin now includes as performatives utterances which seem to lack the formulaic or ritual character early ascribed to performatives.

Australia, philosophy in

Australian academic philosophy has made an international impact disproportionate to the country's small population, though its beginnings contain little that might have suggested such influence. The first Philosophy Chair was established at the University of Melbourne in 1886 and its occupant Henry Laurie was more notable for extravagant shyness than public impact or academic achievement. Until the 1920s, the dominant philosophical outlook was idealism. After the arrival from Glasgow of the charismatic John Anderson to the Chair in Sydney in 1927, this outlook was challenged by his vigorous, distinctive, highly metaphysical and somewhat dogmatic version of realism. Anderson had little international recognition during his working life, but he had a powerful effect upon Australian cultural life and upon students who themselves achieved a significant international presence. Thinkers like David Armstrong, John Mackie and John Passmore diverged in many ways from Andersonianism but the indelible mark of the Sydney baptism remained with them even when they had accommodated to the international profile.

For twenty-five years or so, there was a strong contrast and rivalry between the style of philosophy done in Sydney and that done in Melbourne. Idealist influences persisted longer in Melbourne due to the two Boyce Gibsons (father and son) who occupied the Melbourne Chair successively, but the significant contrasts really began when Melbourne came under the sway of Wittgenstein's philosophy in the 1940s. This was due principally to the presence during the war years of G.A. Paul, one of Wittgenstein's pupils, and later Paul's friend Douglas Gasking, who had studied under Wittgenstein in Cambridge, and another pupil of Wittgenstein, A.C. ('Camo') Jackson. Where Anderson's orientation was systematic, metaphysical and provincial, the Melbournians were piecemeal, anti-metaphysical and (relatively) cosmopolitan. As a direct force in academic philosophy, Anderson's system died with him in 1962, as did the striking contrast in style between Melbourne and Sydney philosophy. With the expansion of universities and philosophy departments, the metaphysical emphasis of Sydney and the analytical professionalism of Melbourne merged in a technique that had no particular regional significance, even when some of its concerns were distinctive. Among these was the phenomenon known as Australian Materialism, associated principally with J.J.C. Smart and David Armstrong. This continued the metaphysical orientation of so much Australian philosophy, though deploying the analytical and argumentative skills by then common to English-speaking philosophy anywhere. Much of the passion surrounding the materialism debates of the 1960s and 1970s, involving the pros and cons of 'the scientific world view' and its reductionist enthusiasms, dissipated into broader metaphysical and psychological interests such as the discussion of universals and laws, realism versus antirealism, the ontology of space and time, and the status and pretensions of cognitive science.

There remains important work that is somewhat independent, even occasionally sceptical, of these metaphysical directions: work in epistemology, philosophical psychology, history of philosophy, and value theory. In pure value theory, there has been little home-grown work that is highly original though there have been many solid contributions by Australian philosophers to international debates, and Peter Singer is famous beyond philosophical circles for his theorizing of 'animal liberation' and opposition to 'sanctity of human life' outlooks in bioethics. The general tenor of Australian philosophy remains resolutely 'analytical' though there is a significant minority interest in 'continental' philosophy and some efforts to reach a modus vivendi *between the two. Until late in the twentieth century, women played no prominent role, but women philosophers and feminist philosophy have become increasingly significant and, although many find the 'continental' mode congenial to their approach, there is strong representation of the more 'analytic' tradition. Another prominent emphasis has been environmental philosophy which incorporates the traditional interest in metaphysics but with a less reductive touch than has been characteristic of the mainstream.*

1 Beginnings

Academic philosophy, the home for almost all contemporary philosophy, effectively began its Australian life in Melbourne where the first lecturer in logic was appointed at the University of Melbourne in 1881. The appointee was the Scottish-born journalist, Henry Laurie, who shortly afterwards (1886) became the country's first philosophy Professor. Prior to Laurie, some logic and political theory had been taught at Melbourne by the redoubtable W.E. Hearn, an extraordinary polymath with an international scholarly reputation, who also taught at

various times English, Ancient and Modern History, Political Economy and Classical Literature, before becoming the University's first Dean of Law. In Sydney, some logic had been taught along with classics since the University's foundation in 1850, but a lectureship in philosophy was not established until 1888. There had been a compendious Chair in English Language and Literature and Mental and Moral Philosophy established earlier at the University of Adelaide, but its first occupants had no philosophical claims. The professing of philosophy there really began in 1894 with the appointment of the gifted, if often obscure, William Mitchell who gave the prestigious Gifford Lectures in Aberdeen in 1924-6, later published as *The Place of Minds in the World*. Mitchell (later Sir William) was a great public figure in South Australia where he was Vice-Chancellor of the university for twenty-six years and Chancellor for a further six. He died in 1962 at the age of 101 and, in his nineties, was capable of vigorous exchanges with one of his young successors in the philosophy Chair, J.J.C. Smart.

Both Laurie and Mitchell were Scots and the Scottish influence on the formative years of Australian philosophy is even more remarkable than its notable influence upon Australian universities generally. In Sydney, the Scottish influence was if anything even more emphatic and enduring - it was Glasgow University that produced the first lecturer in philosophy (1888) and then the Challis Professor of Mental and Moral Philosophy (1890) in the (same) person of Francis Anderson. Like Mitchell, Francis Anderson was later knighted, but more for his services to education than philosophy. Some thirty-seven years after Anderson's appointment to the Chair, another (unrelated) Anderson came from Glasgow (via Cardiff and Edinburgh) as the third and most famous occupant of the Chair, though there was never any question of his being given, or accepting, Royal honours.

Philosophy in Australia in the late nineteenth century made little impact on the rest of the world and not much impact on the country's intellectual or social life. The US idealist philosopher, Josiah Royce, took leave from Harvard to sail to the Antipodes in 1887, seeking recovery from a bout of depression. The visit cured him, and much that he observed filled him with admiration for Australia and New Zealand. Upon his return to the USA, he wrote extensively of his impressions, but made no comment upon the fledgling state of academic philosophy or, indeed, of university life at all. In political philosophy, Royce was what would now be called a 'communitarian', and he was taken with what he thought was the more community-oriented nature of Australian attitudes compared to the individualism of the USA. If he made no contact with academic philosophers, he did become acquainted with some influential politicians and was greatly impressed by the philosophical outlook and statesmanship of the Victorian politician Alfred Deakin, who was to be one of the 'founding fathers' of the Federated Commonwealth, and eventually Australia's second Prime Minister. Royce described Deakin as 'a lover of metaphysics' and continued to correspond with him after returning to the US. Deakin seems to have drawn his own philosophical inspiration from overseas and, in any event, no Australian philosophers contributed significantly to theoretical debates about Federation or the form of the Australian Constitution as it was drawn up in 1900. Whether because of this, or because so few of its drafters had the philosophical and cultural leanings of a Deakin, the document is notably prosaic, legal, and uninspiring. This is in striking contrast to the highly philosophically oriented US constitution, but that was of course the product of a revolution of arms and of thought, whereas it was Australia's fate to achieve a peaceful evolution to independence.

2 Early influences

Well into the twentieth century, Australian philosophy was predominantly idealistic in orientation, eclectic in shape and inspired by foreign models. Its Scottish origins ensured the influence of Scots thought, but the great days of the Scottish School of Common Sense were past by the time philosophy began to be taught seriously in Australia, so it was Sir William Hamilton's rather windy, Neo-Kantian 'corrections' of Thomas Reid, and A.S. Pringle Pattison's idealism that prevailed, rather than Reid's own vigorous, realistic, somewhat Aristotelian elaboration of a common-sense philosophy (see Commonsensism). Earlier in the century, Reid had had a powerful influence upon the development of US philosophy, an influence which contributed to the growth of a distinctively national style of philosophy in the form of pragmatism. In Australia, however, the initial Scottish influences gave rise to no native school. Mitchell, it is true, made many shrewd philosophical observations and developed an original and, to some degree, internationally recognized version of idealism, but the opacity of his thought virtually prohibited its development by others. Laurie was a capable teacher, but he had no distinctive philosophy to impart and was, in addition, painfully shy. Francis Anderson, though more expansive, was notable for educational reforms rather than philosophical innovation.

Besides the Scottish influence, there were also sources from Continental Europe - Hegel, of course, but subsequently Bergson, Husserl and Eucken, these latter notably present in Laurie’s successor at Melbourne, W.R. Boyce Gibson. The older Gibson assumed the Chair in 1911 and his son Alexander followed him in 1935. The Gibson reign thus lasted fifty-four years, from 1911 to 1965. Gibson senior studied in Europe and, at Jena, came under the spell of Rudolf Eucken. Later, he attended Husserl’s seminars and translated one of his books. It is a curiosity of the history of thought that Eucken (now almost utterly forgotten) should have so influenced the older Boyce Gibson in Jena when there was in that same university at the time a philosopher at the height of his powers, destined to exert a massive influence upon modern analytical philosophy. Of course, Gottlob Frege was in the mathematics department and unacknowledged in his own time and his own university, but what a difference it might have made to the development of Australian philosophy had Gibson brought Frege rather than Eucken to Melbourne! Although Gibson had a mathematics background and was to co-author a logic text-book, he seems to have known nothing of Frege and would have found Frege’s realism nowhere near as sympathetic as Eucken’s personal idealism.

Idealism was thought to support certain forms of religion, indeed of Christianity, and there is much emphasis upon the significance of religious belief among the early Australian philosophers. This emphasis is both metaphysical and moral. It engages with the Victorian era’s anxieties about whether faith can survive the encounter with science and, even more urgently, whether morality can survive the demise of religion. The response is heavily, if sometimes inflatedly, metaphysical and the metaphysical interest will later survive the disappearance of the original question and the attempt to bolster religion. It is arguable that this metaphysical cast of mind is one of the most distinctive features of the Australian philosophical tradition, and it early received one of its most striking manifestations in the work of an expatriate Australian, Samuel Alexander.

Alexander was born in Sydney in 1859, but pursued undergraduate studies at the University of Melbourne before leaving Australia to study at Oxford. He was made Professor of Philosophy at Manchester in 1893, having earlier had the distinction of being the first Jew appointed to a Fellowship at either Oxford or Cambridge. During the First World War he gave the Gifford lectures in Glasgow, published as *Space, Time and Deity* in 1920. Alexander’s work is a fascinating blend of old and new. It has a traditional commitment to large-scale metaphysical vision, a commitment that would soon begin to appear outmoded, but it was determinedly realistic in a way that placed Alexander with the burgeoning revolt against idealism. He gave a primary emphasis to experience and science, but insisted on finding a role for religion and God. His moral philosophy was also markedly metaphysical and unusual. In spite of his birth and upbringing, Alexander can only be considered an Australian philosopher in a peripheral sense since his philosophical career was spent entirely in Britain, but his mode of thinking had a powerful influence in his birthplace through its impact upon John Anderson and, to a lesser degree, its very different effect on the second Boyce Gibson. Anderson took from him the opposition to idealism in any form, the resolute realism, the emphasis upon space-time and categories of reality, and the dedication to systematic thought. Gibson was impressed by the emphasis on the significance of religious experience. Interestingly, Alexander’s influence on Australian philosophy was not only abstractly intellectual - he was on the selection committees that appointed both of the Boyce Gibsons and seems also to have had a hand in Anderson’s appointment.

3 Anderson

When he was a lecturer at Glasgow, John Anderson had heard Alexander’s Gifford lectures, and when appointed to the Sydney Chair in 1927 Anderson had already begun to develop the highly individual outlook on philosophy that was to have such a powerful influence in his adopted country. It was an outlook that gave a distinctive cast to much of the philosophy done in Australia during his thirty-one years in the Chair.

The really remarkable features of Anderson’s work were less its realism and argumentativeness (aspects of a mood gathering force throughout much of the philosophical world during Anderson’s working life) than its commitment to systematic metaphysics and the eclecticism of its sources. These qualities set Anderson’s thought apart from the styles of philosophy that came increasingly to dominate Oxford and Cambridge from the 1920s to the 1950s, for these were mostly hostile to systematic, constructive metaphysics. To be educated by Anderson was to be inducted into a different world, though there was a similar commitment to close, often deflationary, examination and criticism of argument: the term ‘criticism’ had a mantra-like quality in Andersonian circles that sometimes consorted comically with the deferential use of the system.

Students found that there was not only an Andersonian position on everything from logic to love, from copula to community, from hypotheticals to Hegel, from reason to religion, but that these positions had an (at least apparent) interconnection that could be intoxicating. In addition, the system provided a comprehensive tool for the demolition of the conventional wisdoms of the day, whether religious, political, moral or institutional. Additional edge was provided by a special vocabulary which often employed familiar philosophical jargon in an unfamiliar sense. It was important to be ‘empiricist’ but not to believe in sense-data or ideas; ‘dualist’ errors abounded well beyond the philosophy of mind and were committed by believing in God or in any sort of ultimates. From within the system, the misguided were shot down in flames with monotonous regularity, though they were seldom persuaded since they rarely understood the terms of the debate. As the poet James McAuley put it: ‘Anderson had an answer to every conceivable question. It was "No"’. In Anderson’s case, as in many others, there was a sort of religious, even sectarian quality about his authoritarian presence, his campaigns and many of his followers, which may help explain the combination of liberation and enslavement that Anderson’s influence could produce.

David Stove, who absorbed Anderson’s influence, but rejected Andersonianism, and developed his own independent, highly polemical philosophical position, once remarked: ‘Anderson’s powers of dismissal were simply boundless…. Einstein scored just one two-line reference in print from Anderson: it said that his theory was "utterly illogical"’ (Grave 1984: 47). The conviction behind such sentiment owed nothing to the developments of modern mathematical logic which Anderson viewed with similar scorn. His logic was based on the traditional syllogistic, ingeniously adapted to try to deal with its apparent deficiencies, and had an almost mystically metaphysical solidity about it. The propositions it dealt with were not ideas or linguistic items or mathematical formulae, not anything representing or picturing other realities or states of affairs, but real states of affairs themselves. To suppose otherwise was to commit the cardinal sin against Anderson’s rigorous realism by proposing intermediaries between thinkers and the realities they were considering. For Anderson, the questions which greatly exercise many contemporary philosophers about the role of conceptual schemes in our understanding of reality would have been non-questions. Things, situations, processes existed in space-time and discussion should attend to determining the truth of such matters.

Anderson professed little concern for worldly success or academic advancement, and denounced the cosy certainties of consumerism and progressivism; indeed one of the few things he admired about religion was its potential for opposing such idols. Early on, he was involved with the Australian Communist Party, but became more and more critical of Marxism and moved to a strongly anti-communist position by the late 1930s. He wrote quite a lot but published little in major international journals, and some of his most important writings appeared in obscure places. Gilbert Ryle invited him to contribute to *Mind*, but he saw no point. He drew inspiration from the ancient Greeks, though selectively. He admired the objective attitude of the Presocratics which he contrasted unfavourably with the anthropocentric, subjective concerns of post-Cartesian philosophy, and he had a special admiration for Heraclitus. Hegel was respected, partly for his opposition to individualism and for the scope of his thought, and Moore, Russell and Alexander were considered significant enough to be critically adapted, but modern influences on his thought tended to come as much from outside the orthodox philosophical canon as from within: Marx and Freud, James Joyce and Sorel, Hilaire Belloc and James Burnham.

Some of his students pursued academic philosophy as rather imitative disciples, others became important contributors to philosophy on the Australian and the world scene. John Passmore, David Armstrong, John Mackie and Eugene Kamenka have all expressed a sense of indebtedness to Anderson and, although his system virtually died with him, its influence can be seen in some of their characteristic views. In other areas of the academy, and in the arts and the professions, people profoundly influenced by Anderson had a striking impact on Australian life, especially in New South Wales and Canberra. Two of Australia’s finest poets, James McAuley and Alec Hope, were students of Anderson and, as a young man, Hope engaged in print in respectful philosophical controversy about moral philosophy with his mentor. In mature life, neither could be regarded as Andersonians - indeed, McAuley converted to a very conservative version of Roman Catholicism - but typical Andersonian concerns remained with them, as with many journalists, senior lawyers, judges and public servants.

4 The Melbourne flavour

In Melbourne, Anderson’s influence was minimal during his heyday, for not only did idealism linger with the influence of Gibson in the 1930s, but Melbourne became an outpost of the new philosophical revolution associated

partly with logical positivism and more significantly with the later Wittgenstein. A primary influence in this development was the arrival of G.A. Paul in 1939, fresh from Wittgenstein's Cambridge. Stranded in Australia by the outbreak of the Second World War, Paul was another Scots-born philosopher to exert a great influence upon Australian philosophy. When he returned to England at the end of the war, he was replaced by his friend Douglas Gasking, whom he had earlier encouraged to migrate to a lectureship in Brisbane. Paul and Gasking had both studied under Wittgenstein as did A.C. ('Camo') Jackson, who went from Melbourne to Cambridge for Ph.D. studies in 1946 and returned to a lectureship in the Melbourne department in 1948. Paul not only brought the new philosophy to Australia, but had an immense influence upon the development of other disciplines at the University of Melbourne, most notably History. In one year, all the full-time members of the History department attended Paul's lectures on logic. Like Anderson's, Paul's impact could be partly explained by his being a big fish in a small pond (an especially small pond, in Paul's case, because of the drainage of intellectual talent caused by the war in the period of his greatest influence) but unlike Anderson, Paul was not an original thinker, and the power of his ideas came largely from afar even if he (like Jackson) clearly was a remarkable teacher. He published very little, and the best of that before he arrived in Australia; his paper 'Is there a Problem about Sense-Data?' was his most influential contribution.

The Wittgensteinian tradition thus established in Melbourne began with a somewhat positivist flavour, but later broadened under the impact of Oxford philosophy and the arrival of refugee intellectuals from continental Europe, many of whom had been absurdly deported from Great Britain and interned in Australia during much of the war. During the 1950s, the Melbourne department was host to a number of philosophers, both foreign-born and locally educated, who later left to pursue philosophy overseas. These included such well-known names as W.D. Falk, Kurt Baier (his New Zealand wife Annette also worked in Australia), Alan Donagan, Brian O'Shaughnessy, Paul Edwards, Michael Scriven and George Schlesinger. This established a trend for a later export industry - John Mackie, Jenny Teichman, Michael Devitt, Mark Johnston, to name a few - and the import-export aspect has continued with people like Michael Stocker and Michael Tooley coming to Australia from North America for long stays and then returning. Whereas Andersonian Sydney into the 1950s was confidently parochial and mostly contemptuous of recent developments in international philosophy, Melbourne stood for a more cosmopolitan and contemporary approach. It also hosted a diversity of outlooks and a professional, problem-oriented approach to the subject that Anderson dismissed as 'eclecticism'. The influence of Wittgenstein was strong, but not overwhelming, and indeed many of the best-known products of the department from that period, such as McCloskey, Baier, Donagan and Charlesworth were not in any sense Wittgensteinians. Douglas Gasking succeeded Boyce Gibson in the Melbourne Chair in 1966 and the Melbourne Department remained less metaphysically oriented than other departments in the country or indeed the new departments in the city of Melbourne. The rapid expansion of university education in Australia from the 1960s eliminated the dominance and the opposition of Melbourne and Sydney philosophy; what remains is mostly a Hegelian synthesis of the metaphysical interest derived from Sydney and the internationalist 'analytic' professionalism drawn from Melbourne.

5 Australian materialism

Since the late 1950s, the metaphysical stream in Australian philosophy has been in flood, first in the theory known as central state (or 'Australian') materialism, and then in a particularly forceful version of metaphysical realism. There has also been a persistent interest in the ontology of space and time. J.J.C. Smart, introduced to philosophy in Glasgow and continuing his studies in Oxford, was converted by U.T. Place from the influence of Ryle. In Adelaide he developed a version of materialism about the mind which was taken up and further developed by D.M. Armstrong, first in Melbourne and later when he moved to the Chair in Sydney in 1964. Armstrong's book, *A Materialist Theory of the Mind* (1968), became something of a bible for the materialist school. It propounded the view that 'the mind is the brain' and defended it against a variety of objections. There were differences of emphasis and formulation among the Australian materialists and there were similarities between their approaches and those of several physicalist and materialist philosophers in Britain and the USA.

The background to the movement was an increasing emphasis on the need to locate philosophy within the perspective of the physical sciences. The relation of philosophy to the developing modern sciences had posed a constant puzzle to philosophers since Descartes, but it became an abiding preoccupation once the 1960s saw the development of a dominance by the USA in academic philosophy. Much philosophy in the USA in the twentieth century has had a strong orientation to the physical (and sometimes social) sciences and, since Quine, the idea that

philosophy is at best a part of science has achieved a certain orthodoxy. Two aspects of the modern physical sciences particularly impressed the Australian materialists - comprehensiveness and reductionism. Armstrong writes with persistent admiration of 'the scientific world view' as something to which philosophy must not only be accommodated but subject, and the basic concept of the material is elucidated deferentially in terms of whatever may be the basic explanatory concepts of contemporary physics. The success of reductive strategies in chemistry and biology encouraged the idea that all manner of philosophically intractable realities would be more manageably understood in terms of scientific items. Much room remained for debate about the nature of the reduction. The identity theory that underpinned the approach generated worries about the respective merits of type identity and token identity, the precise role of functional explanations of mental concepts within the materialists' framework, and the relation of central-state materialism to eliminative materialism. Eliminativists treat the mental as rather like the magical, a category to be superseded by the march of science. Australian materialism, by and large, resisted eliminativism; its stand on mind-brain identities compared them with identities such as that of water with H_2O, and materialists thought that many of our 'folk' understandings of beliefs, pains, feelings and so on were, in their way, as valid and useful as much of our pre-theoretical thinking about water. Revision in the light of science was certainly possible, but elimination was a defiance of common sense.

The materialist mood was dominant for many years, but not all-conquering. Those more influenced by Wittgenstein or Oxford tended to think of the mental in linguistic or social terms; they were suspicious of ontology, especially a radically simplifying ontology, though some were attracted to the ambiguous physicalism of Donald Davidson. Epistemology, philosophy of language and 'moral psychology' were seen as more important than ontology, though the first two topics, at least, were also of concern to some of the materialists, as of course was the philosophy of science. (The Melbourne History and Philosophy of Science department was the second to be established anywhere, and produced such philosophers as Gerd Buchdahl, George Schlesinger, Hugh Lacey and Brian Ellis.) There were also critics of materialism, more sympathetic to the ontologizing mood, who held out for some residual dualism, often centred on the recalcitrance of 'qualia' to the materialist reduction (see Qualia). C.B. Martin in Adelaide was a significant influence here, and both Frank Jackson and Keith Campbell defended the ontological significance and irreducibility of the experiential, of what it is (and is 'like') to be aware of one's surroundings. Jackson even went so far as to support an unfashionable sense-data representational theory of perception in his book *Perception*. Campbell, a migrant from New Zealand, succeeded Armstrong in the Chair at Sydney, and Jackson (the son of A.C. Jackson) is a product of the University of Melbourne who was Professor at Monash University in Melbourne and then followed Jack Smart as Professor at the Australian National University. In a curious repetition of the Gibson dynastic tradition, Jackson succeeded his father in the Chair at Monash, and in 1995 became only the second Australian to give the prestigious John Locke Lectures at Oxford (his father was the first). The sympathies of Jackson and Campbell with the scientistic mood of their materialist colleagues, however, lead them to favour an epiphenomenalist account of 'qualia' so that the reality of the mental items they hope to reinstate is somewhat pallid and causally ineffectual (see Epiphenomenalism). The expatriate Australian, Brian O'Shaughnessy, developed a more positive and original, if sometimes more elusive, double aspect theory of the mind in *The Will* (1980).

More broadly, many critics and defenders of materialism in Australia tended to share a resolute realism in ontology that some believe to have climatic and geographical roots. One external influence has, however, been significant: regular visits since the 1970s of the eminent US philosopher David Lewis, himself an ultra-realist and something of an 'honorary Australian'. Some feel that Lewis' impact has been excessive; if so, it has merely reinforced a homegrown tendency. A sturdy realism is apparent even in some of the work on space and time; Graham Nerlich defends the view that space is not only absolute but a thing. What antirealism exists tends to be associated with the influence of Oxford's Michael Dummett and Harvard's Hilary Putnam (especially through the former's sometime pupil Barry Taylor) though there is a certain antirealist flavour about another interesting antipodean development, the work on alternative logics associated mostly with logicians at or connected with the Australian National University from the 1970s onwards. This was not indeed unique to Australia, but its development was vigorous and its interest in formalizing relevance and contextual relations and in allowing for 'good contradictions' was antiphonal to both the traditional Melbourne indifference to formal logic and the Andersonian scepticism about all its modern developments. It is perhaps significant that many of the practitioners of such arcana were migrants, notably Len Goddard and Graham Priest (from the UK), Bob Meyer (from the USA), and Richard Sylvan, formerly Routley (from New Zealand).

6 Besides metaphysics

Compared with achievements in philosophy of mind and metaphysics, Australians have produced little of originality in 'pure' value theory, though there have been some notable performances in applied ethics. Kurt Baier's *The Moral Point of View* (1958) and Alan Donagan's *The Theory of Morality* (1977) had genuine impact in moral theory, but both philosophers spent the major part of their careers in the USA. Similarly, J.L. Mackie's 'error theory' in his book *Ethics: Inventing Right and Wrong* has been much discussed, if seldom endorsed, but it was published long after he had migrated to the UK. D.H. Monro and H.J. McCloskey published books discussing fundamental moral theory, but they were basically intelligent refurbishings of, respectively, subjectivism and intuitionism. McCloskey's most influential work is found in his stern critiques of liberal political theory and his trenchant criticisms of utilitarianism. One notable feature of Australian moral philosophy in the latter part of the twentieth century has been the prevalence of utilitarianism. This parallels the dominance of materialism and the yearning after a 'scientific world view', although most of the materialists were indifferent to ethics, one of them famously sneering that 'ethics is for girls' - a delicious combination of sexism and philistinism. The materialist Jack Smart has, however, been a strong advocate of a rather traditional utilitarianism, and the theory fits the no-nonsense mood of much Australian metaphysics. In political philosophy, Philip Pettit and Robert Goodin also keep consequentialist and utilitarian flags flying (though C.L. Ten and Robert Young are notable non-utilitarians). In addition, Australia's best known moral philosopher, Peter Singer, has been an enthusiastic utilitarian and has deployed the theory in his various writings and activities in applied ethics. Singer's books, especially *Animal Liberation* and *Practical Ethics*, are among the few by professional philosophers in the latter part of the twentieth century to be widely read well beyond academic circles.

Singer has dedicated much of his work to an attack upon the pre-eminence traditionally given to human interests and values in moral thinking. Developing strands present in classical utilitarianism, especially in Bentham, and drawing on aspects of the thought of R.M. Hare, Singer has denounced any predominant ethical attachment to the value of human concerns as 'speciesist' on analogy with the sins of racism and sexism. Critics have found the analogy unpersuasive, and the Singer programme allows, in any event, that greater significance can be given the human where it can be shown that particular humans have endowments that deserve better treatment than particular animals or other living organisms. None the less, Singer's denunciation of speciesism has a radical and disturbing bite when it comes to the treatment of the very young, the very old and the seriously incapacitated, since many of these currently lack the endowments that differentiate most humans from animals. Such endowments (predominantly associated with the exercise of rationality) are those that Singer, along with many other philosophers, treat as definitive of a species-transcendent category of 'person'. Since only such persons are allowed a 'right to life' (though other beings should not be treated cruelly or callously without good reason) it follows that there is nothing even presumptively wrong with infanticide, and many other non-voluntary homicides. Consistent with this outlook, Singer has attacked any commitment to 'the sanctity of human life' as the outmoded vestige of religion and superstition.

If philosophy in Australia was marked until the 1920s, and to some degree beyond this, by a desire to reconcile religion with the rise of science and to show the continued relevance to ethics of a religious sense of life, there remains less sign of such concern at the end of the twentieth century. Not only is the mood of 'scientistic' metaphysics and the tenor of utilitarian thought generally hostile, or at best indifferent, to religious outlooks, but there has been little substantial positive work in the philosophy of religion. Several prominent Australian philosophers in the last quarter of the century have been committed Christians, and there is a burgeoning interest in certain Asian philosophies with strong religious components. But, apart from Max Charlesworth's founding of a journal in the philosophy of religion, *Sophia*, there has been little to indicate a revival of this project. Indeed, most of the contributions to *Sophia* come from overseas. Atheists have been more evident. C.B. Martin's *Religious Belief* (1959) accompanied a flurry of local interest in the 1950s in the problem of evil, mainly produced by atheists such as Mackie and McCloskey, but despite the high levels of religious attachment in the wider community (as attested by numerous surveys) academic philosophers in Australia have shown little recent interest in defending the religious outlook. There are some signs that this may be changing.

Something like the religious impulse does have a presence in philosophical engagement with problems of the environment, another area of applied philosophy which has had notable currency in Australia. A good deal of writing in this area invokes utilitarian or other more traditional considerations, but that which appeals to the

intrinsic value of the natural order often honours an ideal of respect and even reverence for nature that has distinct religious echoes. The metaphysical impulses of Australian philosophy are well to the fore in much writing on the environment, and appeals to scientific understanding are common enough, but the scientific models invoked are different from those beloved of the materialists. Freya Mathews' *The Ecological Self* (1991), for instance, presents a holistic metaphysics as the basis for appropriate environmental attitudes. There are points of connection between contemporary Australian environmental philosophy and attitudes to nature characteristic of the aboriginal inhabitants of the continent. Whether the aboriginal peoples had a philosophy of the environment is a moot point, but their religious cosmologies and ethical practices foreshadow some of the values and outlooks that many 'green' environmental philosophers seek to defend and systematize (see Ecological philosophy).

7 Feminism and other tendencies

Environmental and bioethical philosophers alike have an engaged dimension to their work, as do other Australian philosophers who work on questions that connect with different areas of public policy. But one of the most interesting developments of a style of philosophy allied to an activist programme has been the energetic expansion of feminist approaches to philosophy in the last quarter of the twentieth century. Genevieve Lloyd's *The Man of Reason* had a key role in this, and was also influential well beyond Australia. Lloyd, who became the first woman philosophy professor in Australia when appointed to the Chair at the University of New South Wales in 1987, has gone on to explore philosophical interests that are unusual in Australia. Like John Passmore, but in a different way, she works on the history of philosophical ideas and the connections between philosophy and literature. Partly because of the influence of feminism there are significant numbers of women in academic philosophy in Australia at the end of the twentieth century, where for most of its history there were very few. Virtually all women doing philosophy in Australia think of themselves as feminists, and most see their work in philosophy as having feminist aspects. There are complex questions here, not of course restricted to the Australian scene, about the sense in which there can be such a thing as a feminist philosophy (or a Catholic philosophy or a black philosophy) since there are constraints internal to any form of inquiry, whether it be mathematics, physics or philosophy, that rightly resist merely external 'doctrinal' imposition. This complexity, and debate about it, is complemented by another: the way in which feminist thinking is informed and often divided by different philosophical traditions, particularly those rather clumsily characterized as analytic and continental.

It is worth remarking in this connection, that most Australian philosophy departments approaching the twenty-first century are heavily 'analytic' in orientation, though there is usually some continental presence. The small Deakin University department and the General Philosophy department at Sydney University have long been much more continental in orientation, and the Faculties department at the Australian National University has been unique in forging an equal and amicable partnership between the traditions. The General department at Sydney resulted from an acrimonious division in the Sydney Department in 1973. The causes of the split were political and personal rather than philosophical: the Vietnam war and the upsurge of radicalism generated throughout the world in the late 1960s, plus a good deal of personal antagonism. The smaller half of the split, the Traditional and Modern department, included the Professor and Head, David Armstrong and his friend, David Stove, both tough-minded philosophers and dedicated anti-communists who supported the war and much else that the majority of the department opposed. The General Department initially had an assortment of radical feminists, Marxists and 'continentalists', but also contained several mainstream philosophers. Over the years, the General department became less political, and evolved into one specializing in continental philosophy, with a strongly historical approach to philosophy. But although continental philosophy had more presence in Australia at the end of the twentieth century, and there have been useful writings in a commentary style, there has been little distinguished creative philosophy produced. Of course, the terms 'analytic' and 'continental' can be distorting - a very interesting book in mixed mode is Max Deutscher's *Subjecting and Objecting* (1983) which acknowledges an equal debt to Gilbert Ryle and Jean Paul Sartre, and contains some pungent criticisms of materialism as a form of totalitarianism.

Some of the most distinctive features of Australian philosophy may have been partly a product of the country's isolation and its small academic population. Intellectual fashions were slow to arrive from overseas and, once transplanted, had plenty of time to develop their peculiar, local shapes. Schools like Andersonianism, Melbourne Wittgensteinianism and Australian Materialism flourished in a climate where you did not need to convert many people to have a dominant school. More recently, technology has considerably reduced the isolation, especially in

the world of ideas, and the philosophical community in Australia has greatly expanded from the small elite of the 1950s. Contemporary Australian work in philosophy remains very impressive, but it is much less distinctive than it once was; like philosophy elsewhere in the English-speaking world, it has acquired the polished professionalism that is part of a relatively homogenized international product. There remain some specifics of style that set it apart to some degree: on the positive side, a penchant for the direct and argumentative, and a widespread preference for a *modus vivendi* between the plain and the elaborately technical; more negatively, a certain tendency towards conformism, a sense that there are 'respectable' views behind which ranks should be closed to the exclusion of outsiders. This tendency was present in the old days and has curiously survived their passing. Maybe it reflects something in the complex national psyche. Australians romanticize rebels and outsiders, exalt egalitarianism, practice tolerance, and praise straight talking, but we have a strong need to belong and we find oddballs and deviants disturbing. A distinguished British philosopher visiting Australia in the late 1960s is said to have remarked of Australian philosophers (perhaps under the pressure of not being treated as deferentially as he had expected): 'They're either mad or boring.' If we read 'competent' for 'boring' and 'visionary' or 'unusual' for 'mad', then perhaps Australians should hope for more madness into the twenty-first century.

Authority

The notion of authority has two main senses: expertise and the right to rule. To have authority in matters of belief (to be 'an authority') is to have theoretical authority*; to have authority over action (to be 'in authority') is to have* practical authority*. Both senses involve the subordination of an individual's judgment or will to that of another person in a way that is binding, independent of the particular content of what that person says or requires. If a person's authority is recognized then it is effective or* de facto *authority; if it is justified then it is* de jure *authority. The latter is the primary notion, for* de jure *authority is what* de facto *authorities claim and what they are believed to have. Authority thus differs from effective power, but also from justified power, which may involve no subordination of judgment. In many cases, however, practical authority is justified only if it is also effective.*

Political authority involves a claim to the obedience of its subjects. Attempts to justify it have always been at the core of political philosophy. These include both instrumental arguments appealing to the expertise of rulers or to their capacity to promote social cooperation, and non-instrumental arguments resting on ideas such as consent or communal feeling. Whether any of these succeed in justifying the comprehensive authority that modern states claim is greatly disputed..

1 The nature and forms of authority

What do theoretical and practical authority have in common? George Cornewall Lewis aptly defined the acceptance of theoretical authority as: 'the principle of adopting the belief of others, on a matter of opinion, without reference to the particular grounds on which that belief may rest' (1849). Authority over action shares this feature. Hobbes (§7) put it this way: 'command is where a man saith, *Doe this* or *Doe not this*, without expecting any other reason than the Will of him that sayes it' (1651). Authority thus offers what H.L.A. Hart (1982) calls 'content-independent' reasons for belief or action: the opinion of an expert or the directive of a ruler, parent, manager and so on is itself meant to be taken as a reason, irrespective of the grounds on which that opinion or directive is based.

A second feature of authority is that its requirements bind its alleged subjects: authority has an exigency that advice or requests lack. Some political realists offer a reductionist account of this, claiming that the exigency ultimately amounts to the credible threat of force. Others suggest it is the justification for force. Neither, however, is plausible, for force is necessary only as a backup when authority fails in its primary aim of directing behaviour. A better view is suggested in John Locke's remark: 'All private judgment of every particular member being excluded, the community comes to be umpire, by settled standing rules; indifferent and the same to all parties' (1690). The key here is neither force nor its justifications but rather the exclusion of private judgment (see Locke, J. §10). Joseph Raz (1986) has influentially argued that authoritative reasons pre-empt or exclude other reasons the subject might have. Authoritative reasons are thus 'exclusionary': they do not outweigh competing considerations but instead make them irrelevant. (It is, however, unclear how sharp a distinction between outweighing and excluding may be sustained.)

The normative character of authority as content-independent and binding has misled some into thinking that genuine authority must always be justified and that 'illegitimate authority' is a contradiction in terms, but this is wrong. 'Illegitimate authority' is on a par with 'invalid proof': while it purports to be or is accepted as valid, in fact it is not. While 'legitimate authority' is thus not superfluous as a term, it is still the sense generally implicit in the term 'authority': authorities are believed to be legitimate. This is fully compatible with a sociological analysis of the structure and origins of such beliefs, like Weber's three ideal types of rational-bureaucratic, traditional or customary, and charismatic legitimacy (the latter resting on the personal virtue or knowledge of an extraordinary leader) (Weber 1922).

2 Political authority

Three important features distinguish the authority of the state. First, the state claims and enforces compulsory jurisdiction over everyone within its territory. Some, such as the English jurist John Austin, consider that the authority of a sovereign state must also be legally absolute (Austin 1832). In fact, however, while the authority of most states is supreme - that is, binding on all other authorities in its territory - it is normally subject to

constitutional limits, although these may consist of the absence of a power to legislate in a certain manner or field rather than the presence of an enforceable duty not to do so.

Second, even when limited the authority of the state is always serious, and it regulates the most vital interests of everyone within its territory. Political authority, as Locke (1690) states, includes the power to regulate life, liberty and property, and to impose any penalties up to and including death.

Finally, political authority claims to impose obligations of obedience. Hobbes doubted this, maintaining that political authority consists only of a liberty to coerce. Friedrich Hayek goes further and states: ‘The ideal type of law… provides merely additional information to be taken into account in the decision of the actor’ (1960). However, neither of these views can explain the nature of political authority as it is seen by state officials and by many subjects. The state is not indifferent to its citizens either obeying its directives or disobeying while suffering the prescribed penalty; it prefers obedience. It is true that not all authoritative government action purports to create obligations - the state also grants permissions, makes declarations of status, and so on - but creating obligations is central to its other activities.

3 Justifications

Anarchists deny that political authority is justifiable at all (see Anarchism §§1-2). Some of their arguments hold that governments are inherently unjust. Others focus on the subordination that is at the heart of authority relations. William Godwin (§3) and, recently, Robert Paul Wolff argue that there is a deep conflict between personal autonomy and the authority of the state, for the subordination of judgment always violates our most urgent duty, namely, to do what we at that moment think right (Godwin 1793; Wolff 1976). This is, however, an odd view of autonomy, for we regularly subject ourselves to the will of others, for example by making plans and promises without which we would have even less control over our own lives. The real issue is thus not the subordination of judgment as such, but its subordination to the state.

Some religions claim that all political authority is ordained by God. Divine right theories, however, merely defer the problem: what justifies the authority of scripture or of divine commands? Humanistic theories, on the other hand, begin on the footing that practical authorities must in some way benefit people, especially their putative subjects. These benefits may be instrumental or non-instrumental.

Joseph Raz (1986) argues that if authorities are to serve their subjects then justifications for authority must normally show that the alleged subjects are likely to comply with the relevant ultimate reasons if they take the directives as binding and attempt to follow them. They must be more likely to do so than they would if they tried to follow the ultimate reasons directly by relying on their own judgment. On this view, all instrumental justifications for authority are indirect.

Arguments of this form underlie a variety of theories, including consequentialist, natural duty and hypothetical contract arguments, all of which purport to establish a need for authority (see Legitimacy §1; Obligation, political §1). Two main considerations are offered. The first appeals to the expertise of the rulers; they have knowledge or wisdom that their subjects lack. The second rests on the purported capacity of the state to sustain valuable forms of social cooperation.

The force of these arguments, however, is limited. It is doubtful whether there is relevant expertise in all moral matters (for example, about distributive justice); nor is there any prospect of agreement about who has it, and no a priori reason to suppose it always lies with the government. Moreover, considerations of equality and democracy argue against rule by platonic guardians.

The argument stemming from social cooperation is more plausible. Owing to short-sightedness, limited information and self-defeating motives, we often fail to coordinate action for the common good. By marking certain actions as obligatory and by providing incentives for compliance the state helps overcome this, solving coordination problems, providing public goods and so on. Objections to such arguments are twofold. First, authority systems are themselves the product of social cooperation, so necessarily there is a problem getting them started. Second, there is risk of overkill; even if authority is sometimes needed to secure cooperation, the comprehensive authority of a state may not be. This marks a general difficulty with all indirect, instrumental arguments. It is not sufficient to show that some set of binding rules would be better than individuals following

their own judgment; it needs to be shown that the actual set of state-sponsored rules is better than the feasible alternative rules. Moreover, as anarchists argue, to rely generally on the state may weaken the capacity to find better modes of cooperation.

Non-instrumental justifications attempt instead to show that authority relations have an inherent value or are constituent parts or logical results of other valued relations. This may hold if authority is consented to, or if the acceptance of authority expresses gratitude to the state or feelings of communal solidarity. However, actual consent is rarely given and does not always bind, and while obedience may be one way of expressing those attitudes and relations, it is not the only way nor always the best way. In a multicultural world of identity politics, it is not even clear that the state is an appropriate locus of these feelings. Perhaps Harold Laski (1919) and the pluralists were right to state that we are each the nodal point of many competing allegiances, none with inherent priority.

Autonomy, ethical

The core idea of autonomy is that of sovereignty over oneself, self-governance or self-determination: an agent or political entity is autonomous if it is self-governing or self-determining. The ancient Greeks applied the term to city-states. In the modern period, the concept was extended to persons, in particular by Kant, who gave autonomy a central place in philosophical discourse. Kant argued for the autonomy of rational agents by arguing that moral principles, which authoritatively limit how we may act, originate in the exercise of reason. They are thus laws that we give to ourselves, and Kant thought that rational agents are bound only to self-given laws. Much contemporary discussion has focused on the somewhat different topic of personal autonomy, and autonomy continues to be an important value in contemporary liberalism and in ethical theory.

It is important to distinguish different senses of autonomy because of variation in how the concept is used. Self-governance or self-determination appears to require some control over the desires and values that move one to action, and some such control is provided by the capacity to subject them to rational scrutiny. Thus, autonomy is often understood as the capacity to critically assess one's basic desires and values, and to act on those that one endorses on reflection. In other contexts, autonomy is understood as a right, for example as the right to act on one's own judgment about matters affecting one's life, without interference by others. The term is also sometimes used in connection with ethics itself, to refer to the thesis that ethical claims cannot be reduced to nonethical claims.

1 Autonomy in the early modern period

Central to autonomy is the notion of self-governance. The earliest use of the term was by ancient Greek writers [*autonomia* (n.), *autonomos* (adj.) from *autos* - self, and *nomos* - law], for whom it was a political concept. A city-state had autonomy if it had authority to enact its own laws and to manage its own affairs, independently of any foreign power. Moral and political philosophy of the early modern period allowed autonomy to be a basic feature of persons, even where the term was not used explicitly. Many seventeenth- and eighteenth-century rationalists held that our moral capacities create the capacity for self-governance. They believed that reason or conscience gives all individuals the ability to discover objective truths either about duty, or about the good, without external guidance through revelation, the church or political authority (see Moral knowledge §3). In addition, they held that agents could be motivated to act simply by their knowledge of moral norms, without the imposition of rewards or punishment (see Moral motivation). Since the content of such norms is desire-independent, the capacity to be motivated by one's moral knowledge gives one control over one's desires. On the assumption that reason or conscience occupies an authoritative role within the self, action guided by one's moral knowledge is self-determined.

Social contract theories of this period conceived of human beings as autonomous in a somewhat different sense, by attributing to them an 'original sovereignty' over themselves. The social contract theorists regarded individuals as by nature free, equal and independent, with authority to regulate their own conduct. It follows that one individual can become subject to the authority of another only through an act of consent or agreement, and that legitimate state powers are those it would be rational to agree to. In Locke's view (1690), individuals in the state of nature are bound by a law of nature requiring them both to preserve themselves, and others in so far as they are able. But all individuals in the state of nature have equal authority to judge and to punish violations of the law of nature. This is the basis of political authority. Locke argues that rational individuals in the state of nature would agree among themselves to entrust this authority to enforce the law of nature to a central power, for the limited purposes of preserving one's own life and liberty. Thus, his theory derives political authority from one's original sovereignty over oneself, which in addition limits the legitimate uses of state power (see Contractarianism in ethics and political philosophy; Locke, J. §10).

Rousseau takes the idea of self-governance a step further, claiming that sovereignty - the power to enact laws - resides in the collective body of all citizens, and that legitimate laws must be self-imposed: 'the people that is subject to the laws ought to be their author' (1762: 67) (see Rousseau, J.-J. §3). Rousseau argued that the freedom and independence of each citizen could be preserved only when individuals agree to submit to the 'general will' - the will of society as a whole concerning matters of common interest. The general will is expressed in laws which

preserve freedom and equality, and which are, accordingly, enacted by a political process in which all citizens participate (see General will). Thus his political ideal is a participatory democracy preserving the autonomy of each citizen, in which individuals are bound only to laws which they have a role in making, and which express each individual's will. Rousseau's famous remark that 'freedom is obedience to the law one has prescribed for oneself' (1762: 56) provided a model of autonomy for later theorists, in particular for Kant.

2 Kant's conception of the autonomy of rational agents

Two different senses of autonomy emerge in the above theories. One is the capacity to guide one's conduct by one's grasp of moral norms. The other is 'sovereignty over oneself' - a basic right to self-governance, which is the basis of further rights and standards of justification. These aspects of autonomy come together in Kant's moral theory. Kant takes the autonomy of rational agents to be the fact that they have the ability to legislate universally valid principles (the principles of morality) through their will, and are bound only by principles that originate in their own reason. This is a capacity for self-determination because action guided by such principles follows self-given laws. Finally, the autonomy of agents is the basis of specific duties, which are requirements of respect for autonomy (see Kantian ethics; Kant, I. §9).

Kant writes: 'Autonomy of the will is the property that the will has of being a law to itself (independently of any property of the objects of volition)' ([1785] 1903: 440). One implication of this claim is 'that man [humanity] is subject only to his own, yet universal, legislation and that he is bound only to act in accordance with his own will' ([1785] 1903: 432). Autonomy has both a negative and a positive aspect. Rational agents are not bound by any principles that do not originate in the exercise of reason, or by any sources of authority external to reason. That is, considerations such as desire, convention, the will of God, or uncritically accepted authorities are not inherently reason-giving; they provide reasons for action only if the agent takes them to. Positively, rational agency is the source of authoritative normative principles. A deliberative process expressing the basic features of rational agency generates authoritative principles of action, in particular, the basic principles of morality (see Practical reason §§2-3). Kant's conception of autonomy reflects the political origin of the concept in that he regards rational agents as a kind of sovereign authority who can give universal law through their willing. So understood, autonomy presupposes certain deliberative and motivational capacities: the capacities to assess critically any proposed reason for action and to be motivated by reasons that are independent of one's desires and presently held values.

Comparisons with earlier moral theories bring out the full dimensions of Kant's conception. In contrast to empiricists, Kant recognized reasons and principles that are not desire-based. Like rationalist theorists, Kant thought that morality consists of necessary desire-independent principles. But he did not think that such principles represent an objective order of values existing independently of rational volition. Rational deliberation is not the discovery of objective principles, but rather the process by which they are generated. Thus, Kant held that agents who act on moral principles act from self-given laws, since these are principles that originate in the use of one's reason. Kant argued that earlier attempts to ground obligation in, for example, the will of God, an objective order of values or obligations, or features of human psychology, all lead to 'heteronomy of the will', because such theories would subject rational agents to an authority external to reason.

Kant thought that the autonomy of rational agents is consistent with moral objectivity. The categorical imperative is the basic principle to which any agent with autonomy is committed, and generates universally valid principles of action. Agents express their autonomy by deliberating and acting from the categorical imperative because it is a rational procedure through which any agent can arrive at principles that other agents can acknowledge as authoritative; that is, it enables one to give law through one's will. Though Kant conceived of autonomy primarily as a feature of persons, individual actions guided by the categorical imperative are autonomous in a derivative sense, since they are guided by self-given principles. By contrast, actions determined by desires or uncritically accepted values are guided by principles external to reason.

Kant's conception of agents as having autonomy determines the content of his normative theory. Kant held that the capacity to give moral principles through one's will is the basis of human dignity, and that all agents are committed to valuing the exercise of their rational capacities. These assumptions underlie his general principle that rational nature should be treated as an end, and never as a means only (see Respect for persons §2). The application of this principle leads to requirements not to undermine the exercise of rational agency through, for example, coercion, deception, paternalistic interference, or contempt and ridicule, as well as positive duties to

support the exercise of rational agency through mutual aid and perfection of one's talents. Thus, the autonomy of rational agents is the basis of specific duties to respect the exercise of rational agency.

3 Contemporary accounts of the nature of personal autonomy

Some contemporary writers concerned with the nature of personal autonomy have distinguished between autonomy as a capacity for self-governance or self-determination, as the actual condition of self-governance, as a personal ideal, and as a right or a social value. (see Feinberg 1986; Hill 1991). Though these notions are defined and related in differing ways, the capacity for self-governance may be viewed as the basis of the other notions. An agent who exercises this capacity effectively is in the condition of autonomy. The personal ideal or virtue of autonomy would be the set of character traits associated with the complete development of the capacity, viewed as a component of the admirable or fulfilling life (see Eudaimonia; Virtues and vices §3). Autonomy viewed as a right is the general right to the unimpeded exercise of this capacity in matters concerning one's own life. The next two sections will focus on contemporary accounts of the capacity for autonomy, and on autonomy as a value.

Self-governance intuitively requires that one have control over the psychological states that determine one's actions, and that the desires and values that guide one's choices be 'truly one's own'. One might hold that one's desires and values are one's own when one identifies with or endorses them as a result of critical reflection. Thus, autonomy may be defined as the capacity to assess critically one's basic desires and values, to revise them if one judges that there is reason to, and to act on those that one identifies with or endorses upon critical reflection. This capacity enables one to take responsibility for one's basic desires and values, and to shape the direction of one's life.

This definition relies on a distinction between first-order desires (desires for certain objects or activities) and higher-order reflection about one's first-order desires, and makes the capacity for higher-order critical reflection central to autonomy. Higher-order values may be viewed as judgments about which of one's first-order desires and values one wants to be moved by; or alternatively, as evaluative judgments as to whether goals or activities towards which one is inclined are really worth pursuing, whether certain of one's values or character traits are good, and so on. Take, for example, a person who cares greatly about material goods. Agents with autonomy can ask whether they want to be moved by materialistic desires to the extent they currently are, or whether it is good to care about material goods to that extent. Moreover, such agents can modify their values and conduct if they see reason to. Note that autonomy should not be interpreted as a capacity to create one's desires and values *ex nihilo*. That would imply, implausibly, that no one possesses autonomy, since individuals are deeply influenced by social and cultural factors. Autonomy need not require that one be the ultimate source of one's desires and values, but only that one have the capacity to assess them critically.

The capacity for critical higher-order reflection is a normal feature of rational agency which may be developed to differing degrees by different agents, and which can be interfered with by such factors as psychological disorder, external manipulation of an agent's deliberative processes, and social conditioning. A full treatment of personal autonomy must spell out the kinds of influence that undermine autonomy. It must also provide some account of the process of critical reflection. Here several questions arise. What guides the formation of one's higher-order values? While autonomy would seem to require some control over one's higher-order values, even they are unavoidably shaped by upbringing, culture, and other factors beyond one's control. Which forms of social and cultural influence at this level are consistent with autonomy? Some of these problems are illustrated by the following example. Imagine a woman who has been socialized to believe that women ought to be subordinate to men and who has internalized this social role. On conscious reflection she judges that she is leading a good life, identifying with her subservient social role and endorsing the character traits of submissiveness that enable her to fulfil the expectations imposed upon women in her society. This sort of example suggests that a capacity to apply critical reflection to one's higher-order values - which appears lacking in this person - is necessary for autonomy. The question of when one's values are 'truly one's own' arises for higher-order values, just as it does for first-order desires and values. Should we then conclude that the higher-order values leading to endorsement of one's first-order desires and values should themselves be accepted or endorsed through critical reflection? If so, how do we avoid ascending levels of higher-order evaluation continuing *ad infinitum*? The worry is that either critical reflection must continue indefinitely, or the point at which it terminates is arbitrary.

Most theorists would agree that a capacity for ongoing critical reflection about one's higher-order values is

necessary for autonomy; that there are empirical limitations on the level to which individuals can carry higher-order reflection, and that contingency is inevitable in the higher-order values that determine one's first order identifications; and that higher-order reflection can be terminated in non-arbitrary ways. But there are different views about the resolution of higher-order reflection, which represent different views about the critical reflection needed for autonomy. One might hold that critical higher-order reflection, in principle, permits individuals to call into question any deeply held value. While never totally free of social and cultural influence, individuals can, either on their own or in dialogue with others, achieve sufficient distance from their basic values to view them critically. Eventually, one must decide which values to accept. But such a decision is not arbitrary when underwritten by the judgment that further reflection will confirm one's present decision.

Other theorists have argued that the process of critical reflection must principally satisfy 'conditions of procedural independence': it must be free from such obstructions as internal obstacles (such as psychological disturbance), manipulation, coercion, and unacceptable social conditioning (Dworkin 1988). The burden on such a theory is to spell out these conditions of procedural independence. This approach places no constraints on the substantive values that an autonomous agent could accept. Any values are consistent with autonomy, as long as one accepts them on one's own. A different approach holds that autonomy requires the capacity to modify one's values in the light of objective or fully reasonable values. This theorist would take the failure of an agent's reflective values to satisfy certain objective standards (for example, if one's values are clearly detrimental to individual fulfilment, or are morally flawed) as indicating a lack of autonomy.

4 Normative dimensions of autonomy

In much contemporary ethical and political theory, autonomy plays both a foundational and a normative role, as illustrated by the structure of Kant's ethical theory. The capacity for autonomy, as described in the previous section, is so central to agency that respect for persons is plausibly construed as respect for the exercise of this capacity. Thus in much contemporary ethical theory, a view of persons as having autonomy is the basis of a general right to act on one's own judgment of what one has most reason to do, from which one can derive more specific principles, such as duties not to interfere with a person's freedom, duties to refrain from coercion, manipulation, paternalistic interference, and so on, as well as positive duties to support autonomy. Many theorists hold that the wrongness of certain kinds of actions may be explained by noting how they interfere with, or deprive individuals of their autonomy. It is important to note that what autonomy-centred theories value is the opportunity to guide one's actions by one's exercise of the capacity for critical reflection. This is considerably more complex than simply acting on one's own desires.

Similarly, autonomy is a central value in modern liberalism and democratic theory (see Liberalism §3). A conception of persons as having autonomy figures in liberal conceptions of justice, the liberal principle that the state should not promote any particular conception of the good, and in arguments against state paternalism (see Justice §5; Paternalism §3). It is the basis of those rights and liberties that are the institutional means necessary for individuals to exercise autonomy - including liberty of conscience, rights of free expression, liberty to develop one's own plan of life (within the limits of justice), and rights of political participation. While autonomy is more prominent in the Kantian and social contract traditions, it can also play a role in utilitarian theories (see Utilitarianism). Mill, for example, argues in *On Liberty* (1859) that the exercise of judgment, choice and responsibility, and the development of individuality are essential to individual fulfilment. This conception of happiness permits him to argue on utilitarian grounds against state paternalism and for a set of civil liberties that allow individuals to exercise autonomy. His view, in short, is that institutionalized liberties protecting individual autonomy will promote general happiness (see Mill, J.S. §§11-12).

The importance of autonomy to contemporary liberalism is illustrated by features of Rawls' theory of justice (1993). One of the organizing ideas of Rawls' theory is a conception of persons as possessing two 'moral powers', which they have a fundamental interest in exercising. These are a capacity to develop, revise and pursue a conception of the good and a capacity for a sense of justice. Possession of these moral powers is the basis of moral equality, entitling individuals to equal consideration. The principles of justice which Rawls derives set out the political and social conditions that guarantee to each individual opportunity to exercise these moral powers effectively, with the principle of equal liberty listing basic individual liberties, and the principle of equal opportunity together with the difference principle (that inequalities should benefit the least advantaged) spelling

out further social and material conditions. In this way, a conception of persons as having autonomy plays a role in determining the content of a conception of justice. A further aspect of Rawls' theory directly parallels Kant's conception of autonomy. Kant held that rational agents are bound only by principles that originate in their own will. Similarly, in Rawls' theory, the final standards of justice are those that persons would autonomously choose for themselves. Rawls supports his conception of justice by arguing that the two principles would be chosen in the 'original position' - a conceptual device representing a fair choice by free and equal persons, with an interest in securing the exercise of their two moral powers. This particular aspect of autonomy is seen in the fact that the agents in the original position are not bound by any antecedently given moral principles. They are free to choose whatever conception of justice will best advance their basic interest in the exercise of their moral powers, and whatever would result from such a choice determines what is just (see Rawls, J.).

The value placed on autonomy is not unchallenged. Many theorists have argued that the emphasis on autonomy ignores or fails to leave room for other important values, such as the value of ties and attachments to others, loyalty to groups, respect for tradition, or the value of community. Versions of this objection hold that within autonomy-centred theories, personal commitments and attachments and obligations to others become purely voluntary, and thus cannot be definitive of the self. But surely, the objection continues, we can have commitments, attachments and obligations that are essential to our identity (see Morality and identity §4). In reply, it is sufficient to say that autonomy need not be conceived in a way that makes it inconsistent with such values, and that viewing autonomy as central does not entail viewing it as the sole value (see Moral pluralism). Nothing in the conceptions of autonomy surveyed above precludes agents from deciding as a result of critical reflection to take on binding obligations or to affirm attachments to others, or from concluding that certain commitments and ties are inescapable because constitutive of who they are. We may conclude that autonomy is deeply embedded in the modern notion of the person and is an important modern value.

5 The autonomy of ethics

The autonomy of ethics uses 'autonomy' in a sense not directly related to the autonomy of agents. It is the thesis that ethical principles or claims cannot be reduced to, or explained in terms of, statements containing no normative terms (see Logic of ethical discourse §§2-4). 'Normative terms', such as 'ought', 'good' and 'bad', 'right' and 'wrong', 'just' and 'unjust', are those which state the intrinsic value of, approve or recommend an action or state of affairs, or state that there is reason to perform certain actions or pursue certain ends. (They contrast with 'descriptive terms', which describe or report purely factual states of affairs.) The autonomy of ethics, for example, can allow claims about what is right to be explained in terms of the good (or vice versa), but holds that any such explanation of an ethical claim must use some normative language. Theorists who accept the autonomy of ethics can include intuitionists, for whom ethical statements are claims about mind-independent ethical properties, such as rightness or goodness (see Intuitionism in ethics); noncognitivists, who take ethical claims to express attitudes of approval or recommendation (see Analytic ethics); or practical reason theorists, who hold that ethical claims are based on principles of practical reason - principles which we accept in virtue of being rational (see Practical reason). Common to these theories is the view that the normative aspect of ethical discourse is not capturable in language devoid of normative terms.

More broadly, the autonomy of ethics includes the independence of ethical theory both from other areas of philosophy and from the natural and behavioural sciences. This does not mean that ethical theory can ignore these fields. Rather, it means that questions about the content and validity of fundamental moral principles do not depend on answers to questions of, for example, metaphysics, epistemology, or philosophy of mind, and that they are not dictated by the results of empirical inquiry. Ethical theory, as concerned with normative questions, has its own distinctive subject matter and tools of inquiry. To give one example, modern Kantians have thought that the moral principles that we accept should not be restricted by a picture of motivation derived solely from empirical inquiry, rejecting the idea that our motivational capacities can be described without any reference to normative principles. If we can be motivated by our acceptance of moral principles, then certain motivational states can be described only by reference to the reasoning that underlies them. Moral theory is then required for insight into certain of our motivational capacities (see Rawls 1975, 1993; Nagel 1970).

Avenarius, Richard (1843-96)

Richard Avenarius, a German philosopher, is known as a proponent of 'empiriocriticism' and the principle of economy of thinking. Empiriocriticism is a modern version of empiricism which attempts to restore the concept of the natural world and 'pure experience' through the elimination of 'introjection', understood as an insertion of redundant or distorted ideas and images into the objects of our knowledge. Avenarius traced back the origin of introjection to the cultural stages dominated by magic and mythology, yet his criticism applied also to traditional philosophy and science. His position is usually classified as a version of positivism, closely resembling the empiricist doctrine of Ernst Mach. Although his influence on some members of the Vienna Circle, especially Moritz Schlick, was considerable, the impact of his contribution has been hampered by his idiosyncratic use of language, especially in his masterpiece Kritik der reinen Erfahrung (The Critique of Pure Experience) (1888-90).

Avenarius was born in Paris, where his father owned a German publishing house. However, he spent his formative years in Leipzig and Berlin and received his Ph.D. in 1868 for a dissertation concerned with aspects of Spinoza's philosophy. Avenarius' *Habilitationsschrift*, presented in Leipzig under the title *Philosophie als Denken der Welt gemäss dem Prinzip des kleinsten Kraftmasses (Philosophy as Thinking of the World in Accordance with the Principle of the Least Amount of Energy Expenditure)* (1876), contributed to his fame and facilitated his appointment as Professor for Inductive Philosophy in Zurich, Switzerland. Avenarius held this position until his untimely death in 1896. During this period he published his significant works: *Kritik der reinen Erfahrung (The Critique of Pure Experience)* (1888-90) and *Der menschliche Weltbegriff (The Human Concept of the World)* (1891). In 1877 Avenarius founded an important philosophical journal, *Vierteljahrsschrift für wissenschaftliche Philosophie (A Quarterly for Scientific Philosophy)*, which he edited until his death. Perhaps the most famous of his disciples isJoseph Petzoldt, who edited posthumous editions of Avenarius' works.

Avenarius combines his version of empiriocriticism with the concept of the natural world which he wanted to restore. His method comes very close to Husserl's phenomenological technique of pure description (see Husserl, E.). 'Findings' (phenomena) are the point of departure for such pure description, and they encompass environmental components including the bodies of other persons. To distinguish human persons from other environmental components, Avenarius employs a linguistically founded hypothesis amounting to the interpretation of certain movements and sounds of fellow humans as statements. Accordingly, the endorsement of the natural concept of the world assumes that fellow human beings are not mere thoughtless and emotionless mechanisms. This principle offers then an opportunity to treat the empirical (verifiable) content of human knowledge through an appropriate analysis of meaningful statement-components - a very modern method indeed. Avenarius underscores another basic interpretative principle of empiriocriticism: the 'democratic' supposition of 'human equality'. This principle enables him to make short-cut inferences (by analogy) to similar experiences in other persons, as long as their statement-contents are meaningfully interpreted by the observer. It is through the contents of statements made by other persons that the so-called *E*-values are recognized; the *E*-values are then divided into 'elements' (for example, 'green', 'warm' and so on) and 'characters' (such as 'pleasant', 'ugly' and so on). It seems that Avenarius anticipates here the distinction between cognitive and noncognitive (emotive) constituents of statements, so dear to the later positivists. The *E*-values ultimately depend on the environmental components - on the so-called *R*-values (for example, trees, rivers, the sun). These are the things within the natural environment which a person (called *M*) finds as 'given' - the 'independent factors' of the first kind. Among the environmental components one must further distinguish the physical bodies of other persons, for whom Avenarius reserves the symbol *T*. His empiriocritical triad *MRT* symbolizes the presence and relationship between these three factors. The dependence of the *E*-values on the *R*-values is mediated by the brain and the entire central nervous system of the person in question. This empirical system *C* is then regarded as the 'independent factor' of the second kind. Impressed by the optimistic results of neurophysiology in his time, Avenarius strongly emphasizes this system *C*. He assumes that there is an obvious dependence relation between an *E*-value (say, of the person *M*) and some change in the person's system *C*, symbolized by ΔC. The complete account of these dependencies yields the following:

$$R \rightarrow M \rightarrow C_M \rightarrow E_M$$

We read this: a certain environmental component *R* is affecting the body of the person *M* and further, through the

proper nervous channels, the brain of the person *M* who then produces the respective *E*-value (expressed in statements). In *Kritik der reinen Erfahrung* Avenarius offers the following explanation: 'In every case, in which *E* is regarded as dependent upon *R*, *E* is taken as immediately dependent upon a *change* of *C*' (1888-90: 1, 80). Yet the indirect dependence relation of E_M upon *R* is treated by Avenarius as a purely logical functional relation, in accord with his positivistic rejection of causality. Avenarius undertook a grandiose programme of biological reductionism, supported by his principle of economy of energy expenditure: the limited amount of energy possessed by human organisms should not be wasted beyond necessity. Actively or passively, the human organism (governed by its system *C*) participates in a multitude of processes which are arranged into time-dependent 'vital series' of two basic types: independent and dependent. Avenarius characterizes the vital preservation maximum of an organism as the equality of its partial systematic factors:

$$\Sigma f(R) + \Sigma f(S) = 0$$

In this equation, the sum of environmental factors *R* equals the (negatively prefixed) sum of the bodily factors *S*. Variations in these interactions are responsible for a variety of 'vital differences' expressed in inequalities. The organism tends to reduce or eliminate such differences if they weaken its preservation value. Allegedly, the system *C* of the organism is setting up an idealized goal of perfect vital series and it affects variations of the actual vital series in this direction.

This biologically founded teleological doctrine is related to Avenarius' rejection of 'introjection' as an unwarranted insertion of something which distorts the purity of the original experience. Avenarius believed that the elimination of introjection will lead to restoration or 'restitution' of the natural concept of the world, with beneficial results for human knowledge and action. His ideals of 'pure experience' demanded the rejection of any philosophical dualism and a positivistic revision of traditional metaphysical beliefs. Thus he got close to the 'neutral monism' of Ernst Mach (§4), William James (§6) or the early Bertrand Russell (§13) (see Neutral monism). In the Preface to *Kritik der reinen Erfahrung*,Avenarius programmatically declared his intention to go directly to things as such ('*an die Sachen anzuknüpfen*'), thus foreshadowing the later goals of Husserl and Heidegger.

Averroism

'Averroism', 'radical Aristotelianism' and 'heterodox Aristotelianism' are nineteenth- and twentieth-century labels for a late thirteenth-century movement among Parisian philosophers whose views were not easily reconcilable with Christian doctrine. The three most important points of difference were the individual immortality of human intellectual souls, the attainability of happiness in this life and the eternity of the world. An 'Averroist' or 'Radical Aristotelian' would hold that philosophy leads to the conclusions that there is only one intellect shared by all humans, that happiness is attainable in earthly life and that the world has no temporal beginning or end. Averroists have generally been credited with a 'theory of double truth', according to which there is an irreconcilable clash between truths of faith and truths arrived at by means of reason. Averroism has often been assigned the role of a dangerous line of thought, against which Thomas Aquinas opposed his synthesis of faith and reason. The term 'Averroism' is also used more broadly to characterize Western thought from the thirteenth through sixteenth centuries which was influenced by Averroes, and/or some philosophers' self-proclaimed allegiance to Averroes.

1 Rise of the terminology

Averroes, the twelfth-century Muslim commentator on Aristotle, exercised a strong influence on Latin scholastics from about 1230 onwards (see Ibn Rushd). Around 1270, the derogatory term *Averroistae* ([too ardent] followers of Averroes) began to be used, principally to characterize adherents of the view that there is only one shared human intellect. In 1277 the Bishop of Paris, Etienne Tempier, accused unnamed masters of arts of the University of Paris of paying more attention to heathen philosophers than to Christian revelation, and of behaving as if there were two truths, one of philosophy and another of faith. The theory of one shared intellect was among the 219 theses the bishop condemned. A generation later, Ramon Llull launched a series of attacks on university philosophers whom he saw as continuators of the lines of thought condemned in 1277, and used the term *Averroistae* to describe these philosophers.

Based on this medieval use of *Averroistae*, the term 'Averroism' was introduced in nineteenth-century historiography of philosophy. Averroism was conceived of as a movement of thirteenth-century thinkers faithful to Averroes, proclaiming that the same proposition could have different truth values in philosophy and theology, so that there was an unbridgeable inconsistency between philosophy and faith. Averroism was cast as a sinister force (a precursor of modern atheism), valiantly combatted by Albert the Great and Thomas Aquinas, notably in the latter's *De unitate intellectus (On the Unicity of Intellect)* and *De aeternitate mundi (On the Eternity of the World)*. Twentieth-century historiography came to identify three main currents in late thirteenth century philosophy: first, Augustinianism, mainly represented by Franciscan thinkers, which combatted the growing influence of Aristotelian philosophy (see Augustinianism); second, Averroism, which took a radically Aristotelian approach to philosophical problems, even though this must lead to conflict with Christian faith; and third, the current led by Albert the Great and Aquinas, who produced a synthesis of Aristotle and Christian faith (see Aristotelianism, medieval).

Early in the twentieth century, it was commonly assumed by historians that almost all the 219 theses condemned in 1277 were of Averroist provenance, and since there is medieval evidence that the main targets of the condemnation were Boethius of Dacia and Siger of Brabant, they were thought to have embraced most of the 'heterodox' opinions. Siger, who is known to have engaged in university politics, began to be seen as the leader of an Averroist party at the University of Paris in the 1260s and 1270s.

Subsequent research has undermined the foundations for the historiographical scheme in which a thirteenth-century 'Averroism' belongs. First, the majority of the theses condemned in 1277 were not inspired by Averroes. Moreover, scholars often apply the label 'Averroist' also to later philosophers who were influenced by Averroes or continued the views of writers such as Siger of Brabant: examples include the Parisian masters Ferrandus Hispanus in the late thirteenth century and John of Jandun in the early fourteenth century, and to a long list of Italian writers from Gentile da Cingoli in the 1290s and Angelo d'Arrezzo in the early fourteenth century to Agustino Nifo in the early sixteenth century. Some of these writers did indeed defend Averroes' views whenever possible, but such loyalty towards Averroes had not been a characteristic of the men who were condemned in

1277.

When these facts became apparent to historians of philosophy, they began to replace ‘Averroism’ with ‘radical Aristotelianism’ or ‘heterodox Aristotelianism’ as the name of this supposed thirteenth-century school of thought. However, so many historical misunderstandings and ideologically motivated judgments cling to all these labels that they are, in the 1990s, being abandoned. Yet, there are some interesting problems that these labels were meant to help explain, and which still have an important place in medieval philosophy.

2 ‘Averroist’ doctrine

In the later half of the thirteenth century, there was a common conviction that some philosophical tenets were inconsistent with Christian doctrine as standardly understood. ‘Philosophical’ in this connection means Aristotelian on the then standard interpretation of Aristotle, which leaned heavily on Arabic works including the writings of Avicenna and Averroes, and the *Liber de causis* (see Aristotelianism, medieval; Liber de causis).

Three issues stood in the foreground in the conflict between reason and faith: first, whether all humans share a common intellect (monopsychism); second, whether happiness is attainable in this life; and third, whether the world had a temporal beginning.

Monopsychism: It was generally accepted that the intellect (that is, the intellective soul) has both an active component, ‘the agent intellect’, which forms universal concepts on the basis of particular pieces of information provided by the senses, and a passive component, usually called the ‘possible intellect’, which is the initially blank wax tablet on which the active component leaves its imprints in the form of concepts and knowledge acquired. The question was, are the agent and possible intellects genuinely different, and if not, does each human being have its own intellect, or is there only one for all to share?

There was a tradition of considering only the agent intellect to be an extra-human separate substance, responsible for humans’ shared conceptual apparatus; in this view, the individuality of each person’s possible intellect explains why we do not share all our thoughts. One version of this view was held by Roger Bacon. By the 1260s, however, this radical separation of the agent and possible intellects had become rather old-fashioned. The main disputants of the time agreed that the two intellects are one substance, but they disagreed about whether that substance is extra-human. Averroes, as he was commonly understood after about 1250, taught that the intellect is a single impersonal substance with which individual souls enter into contact via their mental representations (phantasms) of extramental things; the intellect uses the phantasms as a basis for abstraction. Modern historiography has applied the term ‘monopsychism’ to this doctrine, which was attacked by Aquinas in his *De unitate intellectus*.

Monopsychism allows for the irrational part of a human soul to be destroyed on death without this affecting the intellect. Like the old assumption of a separate agent intellect, it also accounts for the ability of human beings to share knowledge; but it offers no convincing answer to the objection that if this is the case, then no thought belongs to one individual rather than another. During at least one phase of his career, Siger of Brabant accepted monopsychism, but believed that it was possible to save some private thought for the individual by making the operation of the intellect in a particular human depend on representations (*intentiones imaginatae*) with an origin in sensation unaided by intellect. In his somewhat obscure attempts to explain how the individual ‘plugs into’ (*continuatur*) the supra-individual intellect, Siger relied heavily on Averroes.

Contemporaries were alert to the Averroistic theory’s inability to explain how all humans can share an intellect without sharing all thoughts. However, to medieval thinkers the gravest objection against monopsychism was that it left no individual rational soul to carry responsibility for a deceased person’s acts. Nor was it easy to see how an immaterial intellect could fail to be eternal, which was contrary to Christian doctrine that God creates new souls every day and that they are in principle perishable (God could annihilate a soul if he wished). Nonetheless, for the next couple of centuries most philosophers seem to have held that monopsychism was one of the few rationally defensible views about the nature of the intellect, while standard Church doctrine continued to require the intellect to be both the form of the body and capable of separate, individual, existence. The issue was still very much alive in 1513 when the Fifth Lateran Council explicitly condemned the view that the intellective soul is either mortal or only one for all people, and explicitly asserted that it is the form of the human body, immortal, and as many in number as are the bodies into which it is infused.

Happiness in this life: Around 1260-70, masters from the Faculty of Arts at the University of Paris often expressed a great optimism about the attainability of happiness in this life. Their views strongly resemble those of ancient Neoplatonism, but the strongest impetus came from Arabic philosophy rather than directly from ancient sources (see Neoplatonism; Neoplatonism in Islamic philosophy). The way to happiness was thought to consist in an intellectual ascent to the contemplation of ever higher beings, culminating in contemplation of the First Cause and the (temporary) union of one’s possible intellect with the source of intellectual understanding, the agent intellect; In this tradition, the agent intellect was thought to be a separate substance and not identical with God. Such a state of intellectual bliss was held to be the fullest actualization of a person *qua* human, that is, a rational being.

This line of thought would seem to permit the construction of a naturalistic ethics with no need for either divine revelation or an individual life after death in order that human beings may reach their ultimate goal and happiness. Boethius of Dacia did indeed hold that a natural philosopher must deny the resurrection of the dead, and this was to be a common view for a long time. However, there is little evidence that anyone really wanted to abolish the belief in a second life. The philosophers’ point was simply that while it is known through revelation that supranaturally there will be such a life, a claim to that effect cannot be incorporated into a consistent theory of nature (see Natural philosophy, medieval).

Eternity of the world: Before the 1260s there had been some attempts to interpret Aristotle as if he accepted a temporal beginning of the world. Perhaps the first such attempt was made by William of Conches in the twelfth century. However, as Robert Grosseteste noted in the 1230s, such attempts had failed and the common assumption became that Aristotelian philosophy did in fact require the world to have existed for an unlimited time, partly because creation out of nothing could not be subsumed under any of the Aristotelian modes of change. Change implies the prior existence of something to be the subject of change, and so creation cannot be a species of change. By the 1270s, it was commonly recognized that the concept of creation out of nothing was consistent if not confused with change, but it also became a common conviction that this would wreak havoc on the natural sciences if incorporated among their concepts. The supposed Averroists were thought to have simply denied the temporal beginning of the world (see Eternity of the world, medieval views of).

Double truth: Averroists have been credited with a theory of double truth, occasioned by the fact that when medieval thinkers saw a conflict between philosophy (science) and the teaching of the church, they could not simply reject Church doctrine. Instead, they could hold that philosophers had misinterpreted some of the information obtained by natural means (as Aquinas held, for example), or they could hold that there was no way to detect any error in the derivation of the philosophical thesis, so that the only way out of the impasse consisted in rejecting the thesis on the authority of faith (as did Siger). Alternatively, they could try to explain how the assumption of a first cause makes it reasonable to expect that there are truths which no scientific theory can possibly account for; Boethius of Dacia, who distinguished the conditional truth of a scientific theorem from absolute truth, took that line. A fourth way, asserting that the same proposition can be absolutely true philosophically and also absolutely true theologically, had very few followers, if any at all, but has sometimes been imputed to the ‘Averroists’.

To understand how this misconception should arise, one should remember that most philosophers of the thirteenth to sixteenth centuries were masters of arts; it was their job to teach a non-Christian (Aristotelian) philosophy in a Christian society, and so they were caught in the contradiction between reason and faith. Guidelines on how to deal with this dilemma were given in a decision by the Faculty of Arts at Paris in 1272: henceforward, any master dealing with a problem that touched both philosophy and faith was bound by oath to solve it a way that was not contrary to faith. The result was a widespread use of the technique of first providing a philosophical solution and then adding one ‘according to the truth of faith’. For some twentieth-century scholars use of this technique has sufficed to stamp a philosopher as an adherent of a theory of double truth.

Averroism, Jewish

Averroism was enthusiastically taken up by many Jewish philosophers and adapted in a number of ways that extended its scope beyond mere repetition of Averroes' own arguments. Jewish Averroists were particularly drawn by the potential they found in Averroism for resolving the delicate questions they faced about the relationship between philosophy and religion. The idea that both philosophy and religion are true even when they appear to produce different answers to the same question. Fascinated by the Averroistic idea that religious claims can be interpreted as popular expressions of philosophical truths, the Jewish Averroists followed up with vigour the programme of showing how to translate traditional religious statements into philosophical statements.

Many Jewish philosophers found themselves in a difficulty which they took great pains to resolve, namely, how to reconcile what they believed through faith with what they believed through reason. Averroism seems to be the solution to this problem, since it embodies a theory that explains how faith and reason are connected and makes it possiblc to be both religious and rational at the same time. It is not surprising, then, that many Jewish thinkers were attracted to this philosophical doctrine.

1 Averroes in the Jewish world

Averroes (see Ibn Rushd) came to have a significance in both Christian and Jewish settings that far exceeded his influence in the Islamic lands. There are many reasons for this. Jewish philosophers were impressed with the depth of Ibn Rushd's arguments and with his understanding of Aristotle, who was typically regarded as the paradigmatic philosophical thinker. They were undoubtedly also fascinated by the radical implications of his views. There were many translations of his works into Hebrew and transliterations of Arabic texts of his work into Hebrew script, and these extended far beyond Spain and the intellectual world of the Iberian Peninsula. Many Jewish philosophers wrote commentaries on his works and were influenced by him, in particular Crescas and Gersonides, and he set the agenda for much of Jewish philosophy. The positive references that Maimonides had made to him obviously helped his reception in the Jewish world, and his thought is often linked with that of Maimonides, since on some important topics they are clearly not far apart.

It would be wrong to think of all the Jewish philosophers who were influenced by Averroes as Averroists. Many often argued with his central ideas and criticized his conclusions, and there is no clear category of thinkers who are 'Averroists' in the sense that they accepted everything that Averroes argued. The philosophers discussed below are those who came closest to sharing Averroes' main principles and who tried to adapt them to Jewish intellectual life.

2 Isaac Albalag

Isaac Albalag came from the Pyrenees region during the second half of the thirteenth century. He was in no doubt at all concerning the merits of Averroes over his Islamic predecessors, or even over Maimonides. He translated al-Ghazali's *Maqasid al-falasifah (Intentions of the Philosophers)* into Hebrew, and argued that this book represented al-Ghazali's real views - a thesis that would have horrified the original author (see al-Ghazali §3). Albalag does accept al-Ghazali's argument that there are certain doctrines that must be accepted by religion. These are the existence of reward and punishment for our actions, the survival of the soul after the death of the body and the fact of providence whereby God watches over our actions. In his *Sefer Tikkun ha-De'ot (Setting Doctrines Right)*, he recognizes that philosophy in its Averroistic form does not think much of these religious ideas, and suggests that they are to be accepted by ordinary people who are not capable of philosophy. These ideas will enable them to achieve the highest level of well-being of which they are capable; but that must be contrasted with the sort of felicity that philosophers can achieve, since philosophers can understand far more about the nature of reality than can ordinary believers. The vital tool of understanding here is demonstrative argument, which Albalag, like Averroes, saw as the paradigmatic method of philosophy. Only philosophers are really capable of this sort of thought, and as a consequence, only philosophers can really be allowed to say that they know what is the case.

But what about all those religious texts which it is not possible to verify demonstratively, and which are based on prophecy? Albalag argues that these can be known but not necessarily demonstratively, and that this is no criticism of them. Here Albalag deviates from Averroes, since the latter criticized the claims of *kalam* (dialectical theology)

to understand religious texts, especially difficult religious texts (see Islamic theology §2). There is no point in thinking that theology can help us with such texts, Averroes argued, since it possesses no methodology that can derive a valid conclusion from premisses. Albalag tends to place the interpretations of those in the Jewish mystical tradition of the Kabbalah (see Kabbalah) in the same position as Averroes' *kalam* theologians. He holds that they are capable only of providing dubious and weak readings of Scripture. Indeed, he tends to separate philosophical and religious explanations more radically than Averroes allows. Such a separation is a common feature of Christian and Jewish Averroists (see Averroism). In Albalag's case, what we find is acceptance of both views, but the treatment of one is much less vigorous and intellectually satisfying than the other: when the literal sense of a text cannot be reconciled with a philosophical understanding of the topic, both the literal sense and the philosophical understanding have to be accepted, but in different ways. The literal sense is accepted as something which one would understand completely if one were in the position of the prophets who had originally transmitted the text. One must assume, even though one cannot see how, that this meaning is reconcilable with the philosophical meaning.

A crucial example in Jewish philosophy is the creation of the world. According to the philosophers, on Albalag's account, this doctrine must be understood to cohere with the eternity of the world. What results is a theory according to which God creates the world eternally (see Eternity of the world, medieval views of). Albalag criticizes Maimonides for claiming that Aristotle did not claim to know with certainty whether the world is eternal. In fact, Albalag believes, Aristotle had no doubts concerning the eternity of the world; Maimonides agreed with Aristotle, but did not wish to threaten the faith of the ordinary believers in Judaism. That is the reason for what Albalag sees as Maimonides' ambivalence about the demonstrability of the origins of the world. However, Maimonides should not have suggested that the eternity of the world cannot be established by reason. It can, and philosophers have no choice but to acknowledge that eternity, although they need not broadcast their views widely if they think hearing such things would upset the beliefs and practices of the naive. It is possible to accept the eternity of the world through reason and its createdness through faith, and there is no need to work out how to reconcile these two diverse positions. Albalag does not say why not; but he seems to go further than Averroes, who argues that there is one truth expressible in two different ways, whereas Albalag appears to argue that there are two truths. This takes him closer to the so-called doctrine of double truth often ascribed to the Christian Averroists in their more radical moments.

3 Joseph ibn Caspi

Joseph ibn Caspi was born in 1279 in Provence, and wrote a variety of theological and philosophical works. He was heavily influenced by Maimonides, Averroes and Abraham ibn Ezra, especially by the latter's construction of a philosophical grammar of the Hebrew language (see Ibn Ezra, A.). Caspi defended the literal sense of many passages in Scripture as accurate accounts of past events, and criticized as misleading many of Maimonides' attempts at explaining many of them as prophetic allegories. On the other hand, he shares Averroes' rather ambivalent attitude towards miracles, suggesting that there is a natural explanation for miracles, were we able to understand all aspects of the events in question. To understand a report of a miracle, it seems, we need to understand the point of view and knowledge of those actually present at the time. Prophecy also has to be interpreted in terms of the audience it is designed to impress, and if there are aspects of the event which we do not now entirely grasp, we should put this down to our distance from its occurrence and to our relative lack of knowledge of how the event was regarded at that time. Prophets are able to tell what is going to happen in the future because they are able to understand how the things they observe in the present link with what is to come. The role of the deity in this process is quite limited. Many religious statements are not capable of a truth value; their function is to move people to action and to teach them how to behave. Where philosophy and prophecy diverge, we should remember that they are different and it is hardly surprising that they do not always agree. If we really knew why prophets said what they say and why miracles take the forms they do, then we should understand how they might be reconciled; indeed, we might understand how prophecies are merely more popularly accessible expressions of philosophical truth. Since we are limited in our understanding of religious statements by our distance from their original formulation, we have to accept them as aspects of faith. We can remain confident nonetheless that such statements are in principle equivalent to philosophical truths. Unlike Maimonides and Averroes, Caspi had little sympathy with the idea that the secrets of interpretation should be restricted to the intellectual elite. His point was that they have to remain secrets, since there is no possibility now of finding out

precisely what the ancient statements originally meant, given the differences in audience, language and context (see Prophecy).

4 Moses Narboni

Moses Narboni was born in Perpignan around 1300 and died approximately sixty-two years later. He wrote many commentaries on theological and religious texts, together with some original works and several commentaries on the works of Averroes. He wrote extensively on Maimonides, and tended to criticize Maimonides using arguments drawn from Averroes, as he was one of the few philosophers of the time to recognize that Averroes was seeking to challenge the Neoplatonic metaphysics of Ibn Sina (Avicenna) which formed so important a part of Maimonides' thinking. Narboni also developed Averroes' theory of the 'active intellect' in such a way as to make it relevant to Jewish philosophy.

As human thinking becomes progressively better perfected it moves from being imaginative to becoming intellectual. Ultimately it fuses with the active intellect itself, which is the very principle of intellectual thought. As a result, the material part of us comes under the control of our thought. Using this theory, Narboni is in a position to explain miracles and prophecy as resulting from a certain sort of thinking that produces appropriate material effects, that optimally illustrate the ideas in the consciousness of the prophets but which adapt those ideas to the level of understanding of the audience the prophet has in mind. Here a kind of Neoplatonism creeps back in, for Narboni's language is clearly based on the idea of a hierarchy of intellects where each intellect is connected with an existent (see Neoplatonism in Islamic philosophy §2).

The parallelism between intellects and existents usefully echoes a similar parallelism between doctrines and acts. The idea of what is to be done results in the creation of that state of affairs, and similarly a religious doctrine has as its material aspect a particular form of practice. All of this accords nicely with the unified approach that Averroes takes to the relationship between such diverse phenomena as body and mind, the material and the spiritual, and the theoretical and the practical. The Torah, which is perfect, consists of doctrines which are true and accord with practices designed to bring about a desirable end in line with those true beliefs. Of course, it takes a remarkable individual to understand all aspects of the Torah, and only Moses fulfils that role, a role very similar to that which Averroes ascribes to Muhammad.

Narboni, like Averroes, upholds the principle of plenitude, according to which something is possible only if it is (at some time) actual; and he uses this principle to argue that in an eternal universe, if there can be a most perfect created being then (at some time) there will be. Moses fits the bill exactly. Lesser mortals will not be able to grasp perspicuously the reasons for all the doctrines in the Torah, and will have to accept these doctrines on the basis of faith alone. Narboni thinks it is bad policy to encourage ordinary believers to trouble themselves excessively with finding out the reasons for the commandments. Most people would not understand these reasons even if they were presented with them, and a fruitless search would only frustrate and undermine the faith of the seekers. The prophets are provided precisely for such people, since they are capable of representing philosophical truths in imaginative language which will impress the masses and keep them on the right path. Only those capable of philosophy will understand precisely what is actually intended, and only they should seek such understanding. We see here a reformulation of a genuine doctrine of Averroes, that there is one truth that is expressed in at least two different ways, one intellectually respectable and the other practical and effective.

5 Further consequences

Clearly, there are aspects of Jewish Averroism which are very different both from the philosophy of Averroes himself and from Christian Averroism. In the Jewish milieu, Averroes was commonly linked with Maimonides and, more surprisingly perhaps, with Abraham ibn Ezra. Some thinkers such as Narboni were interested in introducing Kabbalistic doctrines in their explication of the thought of Averroes. Narboni's discussion of providence in terms of astrological causation would have surprised Averroes and horrified Maimonides, but this is by no means a criticism of the approach of the Jewish Averroists to Averroes himself. They employed his thought, and what they considered could be derived from his thought, creatively and combined it with other relevant philosophical and theological theses to produce a novel account of the issues then of concern to the philosophical community.

There were a large number of other thinkers whose work is largely based upon Averroes but who have not been discussed here in detail. The work of Joseph ibn Waqar and Moses ibn Crispin, for example, provides evidence of considerable discussion on Averroistic themes within the Jewish community. It is only with the onset of the Renaissance and the last major Averroist thinker in the community, Elijah Delmedigo, that the passionate interest in Averroes started to decline. Averroes was long seen as the first commentator on Aristotle, and the relative decline in interest in Aristotle was matched with decreasing concern for the thought of Averroes.

One of the contributions of Jewish Averroism is its way of tackling the distinction between religious and philosophical truths. The argument that the pursuit of philosophy is not only permitted by religion but is even necessary for the intelligent adherent comes straight from Averroes himself in his *Fasl al-maqal (Decisive Treatise)*. The warning against trying to prove the truth of religion through philosophy was taken very seriously by the Jewish Averroists, for two reasons. It is a category mistake to try to explain through philosophy what is capable only of religious explanation. Also, the discovery that the truths of Judaism cannot be established philosophically might lead to disbelief or scepticism. This gives rise to an interesting question. If it is inappropriate to refer to the rational basis of a religion as the justification of that religion, what reason is there to prefer one religion to another? This was a lively issue during the Middle Ages, since there were strenuous efforts by Islam and Christianity to convert Jews, and equally strenuous efforts by Jewish thinkers to resist such pressure. The Jewish Averroists had no doubt of the superiority of their religion over its competitors, and they argued that Christianity in particular involves the acceptance of self-contradictory notions.

We must distinguish between those ideas which are in themselves possible and can be actualized through the miraculous intervention of the deity, and those ideas which even God could not bring about, since they are impossible and only an imperfect deity could wish to bring them about. This was the approach which Jewish philosophers took to the notion of God becoming man, the Incarnation, which they regarded as obviously an imperfection, along with a whole range of other crucial Christian doctrines such as the Trinity, transubstantiation and the Virgin Birth (see Incarnation and Christology; Trinity). A whole range of logical problems were discovered in these doctrines and contrasted with the bases of Judaism which, it was argued, is an acceptably rational faith. At least Judaism does not involve the acceptance of self-contradictory notions, although it is true that some of the stories of miracles offend against our understanding of natural necessity. As Aristotelians, the Jewish Averroists might have been expected to have been more wary of allowing for miraculous interventions in nature, since Averroes seems to have regarded such events as just as impossible as logical self contradictions. This is where the use of Maimonides and Abraham ibn Ezra in combination with Averroes proves so useful. Maimonides was used to suggest that the accounts of miracles need not be taken to be literally true (by philosophical readers), and Ibn Ezra was used to show that we are so distant from the time of the miraculous events that we do not really know precisely what the narratives about them are supposed to mean. We do not even know what the language used then really meant, nor how astrological forces brought about change in the sublunar world.

Jewish Averroism should not, then, be seen as a slavish adaptation of Averroes to issues of interest in Jewish philosophy. Some of Averroes' main theses were combined with the opinions of quite disparate philosophers and out of this heady mixture a rich variety of arguments emerges. These arguments are generally more than merely eclectic and they involve a sustained treatment of the logic of the relationship between religious and philosophical language.

Awakening of faith in Mahāyāna

*The Awakening of Faith in Mahāyāna (Dasheng qixinlun) is one of the most influential philosophical texts in East Asian Buddhism. It is most important for developing the Indian Buddhist doctrine of an inherent potentiality for Buddhahood (*tathāgatagarbha*) into a monistic ontology based on the mind as the ultimate ground of all experience. Its most significant contribution to East Asian Buddhist thought is its formulation of the idea of original enlightenment (*benjue*, or in Japanese,* hongaku*).*

Although attributed to Aśvaghoṣa and supposedly translated into Chinese by Paramārtha, there is general consensus among modern scholars that the *Awakening of Faith in Mahāhāyana (Dasheng qixunlun)* was most likely composed in China during the third quarter of the sixth century. Apocryphal texts such as the *Awakening of Faith* played a crucial role in justifying innovations in practice and belief that helped give shape to a uniquely East Asian form of Buddhism.

The *Awakening of Faith* was valued as a concise compendium of essential Mahāyāna doctrines. Its style is terse, often to the point of being cryptic. It thus allows for a range of different interpretations, so much so that some of the commentaries on the work sometimes seem to have been written on different texts.

It would be difficult to exaggerate the importance of this text on the development of East Asian Buddhist thought. Beginning with the influential commentary of Fazang (643-712), for example, it played an increasingly central role within the Huayan tradition, sometimes even eclipsing in importance the *Avataṃsaka (Huayan) Sūtra* on which the tradition based its authority. Its influence permeated early Chan texts in the Tang dynasty (618-907) as well. During the Song dynasty (960-1279), it was at the centre of the doctrinal debates that raged within the Tiantai tradition, as well as to a lesser extent those between the Tiantai and Chan (see Buddhist philosophy, Chinese). It also occupied a central place in the thought of Chinul (1158-1210), whose grand synthesis of Huayan (Hwaôm) and Chan (Sôn) was formative in defining the course of Korean Buddhism (see Buddhist philosophy, Korean). In Japan, it provided the cornerstone for the articulation of the so-called 'theory of original enlightenment' (*hongaku shisō*), which provided the doctrinal matrix out of which emerged the great medieval reform movements of Pure Land, Nichiren and Zen (see Buddhist philosophy, Japanese).

The *Awakening of Faith* developed the doctrine of *tathāgatagarbha* (embryo or womb of the Tathāgata) that had been introduced to China in such Indian Mahāyāna scriptures as the *Lion's Roar of Queen Śrīmālā* and the *Lankāvatāra Sūtra*. This doctrine had proclaimed the inherent potentiality of enlightenment in all sentient beings. Whereas this doctrine seems to have been of relatively minor importance in Indian Buddhism, it became the underlying premise on which the most distinctively East Asian Buddhist beliefs and practices were built. It was particularly valued because it guaranteed the universal accessibility of enlightenment and because it qualified the radical suspicion of language found in the Madhyamaka tradition by ascribing a series of positive predicates to the absolute (see Buddhism, Mādhyamika: India and Tibet).

The *Awakening of Faith* addressed a fundamental philosophical problem in the *tathāgatagarbha* tradition having to do with the relationship between enlightenment and ignorance. This problem was even more acute for *Awakening of Faith*'s ontologized understanding of mind. If the fundamental ground of all phenomena is the intrinsically enlightened mind, then how can ignorance be accounted for? The text tries to answer this question by linking the *tathāgatagarbha* with the *ālayavijñāna* (store consciousness), which explained the process of mental conditioning.

The *Awakening of Faith* begins by positing the one mind as the ultimate source of all phenomena. This mind has two aspects, which together totally comprehend all *dharmas*. The first is the mind as suchness (*xin zhenru men*), which the text defines as that which neither is born nor dies. The mind as suchness is the *tathāgatagarbha* in its true guise as the all-pervading, undifferentiated absolute reality (*dharmakāya*). Even though this mind is unborn and imperishable, differentiations come into being because of deluded thinking. Nevertheless, the true nature of the mind is beyond all predication and thought.

The second aspect of the one mind is referred to as the mind subject to birth-and-death (*xin shengmie men*). Founded on the *tathāgatagarbha*, this aspect of the one mind is identified with the *ālayavijñāna*, which the *Awakening of Faith* defines as 'the interfusion of that which is not subject to birth-and-death [that is, the mind as

suchness] and that which is subject to birth-and-death in such a way that they are neither one nor different.'

The *ālayavijñāna* also has two modes, which embrace and give rise to all *dharmas*. The first is enlightened (*jue*), and the second is unenlightened (*bujue*). 'Enlightened' is explained as meaning that the essence of the mind is free from thoughts. The characteristic of being free from thoughts is likened to the realm of empty space that pervades everywhere and is equal to the undifferentiated absolute body (*dharmakāya*) of the Buddha. Since the essence of mind is based on the *dharmakāya*, it is said to be intrinsically enlightened.

The *Awakening of Faith* goes on to distinguish intrinsic enlightenment (*benjue*) from experiential enlightenment (*shijue*). Experiential enlightenment, moreover, is contrasted with unenlightenment. In fact, the text states that experiential enlightenment can only be spoken of in the context of unenlightenment. Experiential enlightenment refers to the process by which one awakens to the ultimate source of the mind. Intrinsic enlightenment is at once the ontological ground that makes experiential enlightenment possible, and that which experiential enlightenment realizes.

At this point the *Awakening of Faith* introduces a famous metaphor to explain the relationship between ignorance and enlightenment: just as the originally tranquil ocean is stirred into waves by the wind, so the intrinsically enlightened mind is stirred into thoughts by ignorance. Under the heading of the unenlightened mode of the *ālayavijñāna*, the text then enumerates a series of nine stages that, like the classical twelve-link chain of interdependent origination (*pratītyasamutpāda*), explains how the process of karmic bondage develops. The process begins with the first subtle movement of thought. Based on the unenlightened mode of the *ālayavijñāna*, thought stirs the originally tranquil consciousness, which then manifests itself in terms of subject and object. This bifurcation of consciousness leads to the discrimation of likes and dislikes, and the awareness of pleasure and pain gives rise to associative patterns, which produce attachments, which lead to the generation of karma, which leads to becoming bound within the continuous process of birth and death (see Karma and rebirth, Indian conceptions of).

The theory of mind developed in the *Awakening of Faith* can be seen as an attempt to address the problem of ignorance. The relationship between the absolute and conditioned aspects of the one mind, or the *tathāgatagarbha* and the *ālayavijñāna*, traces back to a paradox at the core of the *tathāgatagarbha* doctrine: the *tathāgatagarbha* is at once intrinsically pure and identical with the *dharmakāya* and yet appears to be defiled. The two aspects of the one mind thus seem to be a matter of perspective, and their difference can be seen as corresponding to the point of view of ultimate and conventional truth. The *tathāgatagarbha* as seen from the enlightened perspective of a Buddha is perfectly pure and undefiled. It is only due to the deluded thinking of unenlightened beings that it appears to be otherwise.

The relationship between these two aspects of the one mind brings into focus the central philosophical problem for the *tathāgatagarbha* tradition: the origin of ignorance. If the mind is intrinsically enlightened, how can it become deluded? The problem arises because it is the consistent position of *tathāgatagarbha* theory that ignorance is only adventitious. The *Awakening of Faith*'s metaphor of the water and waves is thus an unsatisfactory resolution of the problem insofar as the comparison of the wind to ignorance posits a separate origin for ignorance. If ignorance had a separate origin, it would have its own autonomous ontological status placing it on an equal footing with enlightenment. The resulting dualistic ontology would undermine the axial premise of the *tathāgatagarbha* tradition that enlightenment is universally accessible to all beings.

In identifying the *ālayavijñāna* with the *tathāgatagarbha*, the *Awakening of Faith* grounds the process of conditioned origination on an intrinsically pure ontological foundation. This means that the defilements that appear to obscure the intrinsically enlightened mind of suchness are merely the manifestation of that mind as it adapts conditions and have no independent basis of their own.

Awareness in Indian thought

Classical Indian schools all stake out positions on awareness, its intrinsic nature, its place in the causal processes crucial to human accomplishment, its relations to objects in the world, and the possibilities, according to certain religious or spiritual theories, of mystical transformation. In several prominent instances, stances taken on awareness may be said to constitute the most salient differentiation among schools, so central to a school's overall outlook is its view on the topic. Classical epistemological conceptions, for example, are in large part shaped by positions on awareness, and the spiritual philosophies for which Indian thought is best known present theories of awareness to guide meditation and mystical practice. Yogic, Vedāntic and Buddhist mysticism all came to be supported by views of the true nature of awareness or its native state.

In the professionalized debates that fill the immense proliferation of philosophical texts in the classical period (from approximately AD 100 to the eighteenth century and later), key issues are whether awarenesses have forms of their own or assume content only with reference to objects, and the precise nature of the relation, or relations, of awarenesses to objects in the world, including the role of awareness in human activity. Some important positions are shared across schools, and apart from the anti-theoretic polemics of Mādhyamaka Buddhists and others, a phenomenalist and idealist stance, a representationalism, and a direct or causal realism are the major theories concerning the content of awarenesses.

The world-oriented philosophies of Logic (Nyāya) and Exegesis (Mīmāṃsā) engage spiritual or mystical views (principally, Buddhist Yogācāra and Advaita Vedānta) on the issue of self-awareness or awareness of awareness. The exchange between upholders of Nyāya and Advaita Vedānta (Vedāntic Monism) on this score is, in particular, an admirable philosophical achievement.

1 Spiritual theories of awareness

According to preclassical texts called Upaniṣads ('secret doctrines'), human awareness offers a latent possibility of world-transcendence, of 'liberation' (*mukti*) of consciousness from embodiment and finite experience. The classical schools of Vedānta, Sāōkhya and Yoga develop views centred on such a mystical possibility, as do the socially revolutionary movements of Buddhism and Jainism (though the latter reject Upaniṣadic authority). In Advaita Vedānta, which of the Vedāntic (or Upaniṣadic) subschools is the most emphatic about the world-transcendent nature of awareness, the only veridical content of awareness is self-aware awareness itself. Awareness is by nature *kūṭastha*, 'stationed at the tip', at the far extreme, remote from the world; at least, it is so in its true nature or native state. In fact, awareness' worldly content is viewed as an illusion and a deformation, a falling away from what awareness is in itself. In this way, apparently, discoveries in meditation would be emphasized (see Monism, Indian §§1-2).

A dualistic view of awareness and the world can be teased out of the Advaita position: the world is contrary to the true nature of awareness, albeit the cosmic illusion depends on awareness, which is its substratum. In the schools of Sāōkhya and Yoga, in contrast, dualism is explicitly maintained: nature and awareness are separate realities, and it is problematic how they are related at all. As in Advaita, the only true content of awareness is awareness itself. With regard to the world, uninvolved witnessing - though, again, problematic (since the witness and the witnessed are unrelated in reality) - is upheld as the state the least estranged from what awareness is in itself (see Sāōkhya §§1-2, 6). (The similarities, by the way, among Advaita, Sāōkhya and Yoga on awareness hold despite the contrast between Advaita's claim that there is in reality only a single self, *ātman* - the appearance of multiple persons belongs to the cosmic illusion - and Yoga's and Sāōkhya's view that there are an infinite number of true persons, *puruṣa*, who are aware.)

The motivations for all three spiritual philosophies appear to be to show intellectually the possibility of a meditative state of self-absorption as well as to maintain its supreme value and desirability. By viewing awareness in its native state as without content other than self-aware awareness itself, the schools avoid having to explain the possibility of meditative self-absorption; rather, it is deviation from that state that is the mystery.

Taking a different angle on the three schools, we find that with respect to the everyday sort of awareness - perceptual awareness, in particular - intricate and carefully formulated theories emerge. According to Sāōkhya and

Yoga, nature ranges without break from luminous and malleable mentality to gross material elements, with the mind viewed as capable of presenting to the witnessing person or self representations of things that are continuous with the things represented both substantially and causally. In the *Yogasūtra*, which is the Yoga school's foundational text, this view is interwoven with a theory of personal transformation through yogic practice. That is, through psychophysical exercises centring on the ability to focus on and identify with any object whatsoever without distraction, there are, according to Yoga philosophy, practically unlimited possibilities of knowledge by extension of personal identity, a knowing of something ordinarily foreign to the self in the direct manner in which one knows oneself. According to Advaita Vedānta, modifications of a malleable 'internal organ' (*antaḥkaraṇa*) account for perceptions psychologically, although it is continually insisted that awareness itself belongs to another realm of reality. In Advaita's long history, a variety of cosmological theories are presented about how awareness comes to be associated with the internal organ, or mind.

Within Indian Buddhism, distinct views of awareness are constrained by the core teaching of an experiential *nirvāṇa* as the supreme good. Disidentification with the body, emotions, sensory presentations and thought is promoted by a 'no-self' doctrine (Sanskrit: *anātman*), a doctrine central to most Buddhist teachings about the way or path to *nirvāṇa*. Thus the real possibility of *nirvāṇa* experience, along with various prerequisites, is thought to demand a view of awareness as free-floating, unmoored by any enduring self or substratum, as well as a view of the apparent self as a bundle of awarenesses (see Buddhist philosophy, Indian §1; Nirvāṇa). Within this common frame, different schools of Buddhist philosophy uphold views of awareness that command attention in a host of classical texts that are less, or only peripherally, concerned with mystical possibilities. We shall take up the more refined Buddhist theories of awareness within that broader context.

2 Representationalism, idealism and direct realism

According to a view that appears in schools of early Buddhist philosophy (as well as in Sāōkhya and, arguably, Advaita Vedānta), awarenesses are of mental figures that represent objects external to awareness. External objects stand in causal relation to their representations, but are not what awarenesses are directly of. Such representationalism is attacked from two sides, from the perspective of phenomenalism and idealism (or at least scepticism about objects' independence of awareness) championed in the Yogācāra Buddhist school, and from the point of view of direct realism formulated in the sister schools of Nyāya (Logic) and Vaiśeṣika (Atomism), as well as in the traditionalist school of Brāhmanism known as Mīmāṃsā(Exegesis). The comparative advantages of representationalism are, first, that different types of awareness - perceptions, memories, imaginings, and so on - can be understood as all of the same type of object, namely, of mental objects, and, second, that the common intuition is affirmed of the independence from awareness of the pots and trees of the world as variously perceived, imagined, and so on, by different perceivers and by the same perceiver at different times. Direct realism has to assume that illusions have ontologically distinct objects from veridical awarenesses (the unreal and the real, respectively), although on any given occasion these cannot be differentiated from a first-person perspective: an illusion can seem to present a real object no less than a veridical awareness. And idealism embraces the counterintuitive position of putting the world in the head (or in the 'warehouse consciousness', *ālaya-vijñāna*; see below).

The Buddhist representationalists (sometimes known as Sautrāntikas) distinguish between the phenomenally existent (*saṃvṛti-sat*) and the substantially real (*dravya-sat*). Substantial existents are ultimate particulars (*svalakṣaṇa*), or atoms, which give rise to, for example, the phenomenon of a pot. Composites are not substantially real - the representation of a particular grouping of atoms, such as a pot, is mind-dependent - and particulars, that is, the substantially real atoms, while causally effective for appearances (though not for wholes *qua* wholes), do not themselves appear, at least not as atoms. The appearance of a pot represents a cluster of atoms, but the particular configuration is determined by human purposes and desires.

Dignāga (born *c*.480), a Yogācārin and an innovative logician (studied by philosophers of all schools), voices empiricist criticism of this position. The assumption that atoms cause the content of awareness although awareness does not represent the specific image of atoms means that a pot or a cup or anything might be perceived as anything else. The attributes of the atoms are not perceived, and everything that is perceived is considered, with respect to the atoms, to be like a double moon. 'It [the truly substantial objective support of awareness] is the object which exists internally to knowledge itself as knowable aspect and which appears to us as if it exists

externally' (*Ālambanaparīkṣā*, 1942: 48). Whether things really exist externally cannot be known.

According to Yogācāra, an awareness manifests a form internal to itself; it is *sākāra*, 'with form'. Yogācārins earlier than Dignāga maintained that a common 'warehouse consciousness' (*ālaya-vijñāna*) accounts for the intersubjectivity of objects among different subjects, and a beginningless psychological impulsion (*anādi-vāsanā*) for the ineluctable error of taking things to be external. Scholars have also supposed that the idealism here is motivated by a cosmological understanding of *nirvāṇa* or by a sense of a need to explain how *nirvāṇa* is an interactive possibility embracing everyone. Yogācāra is a Mahāyāna Buddhist school, and at the core of Mahāyāna is the teaching that we and everything are all interconnected, and that through the efforts of the Bodhisattvas (those of superlative wisdom and compassion) we shall eventually all arrive together at the supreme felicity (see Buddhism, Yogacārāschool of).

But whether Dignāga (or his equally illustrious follower, Dharmakīrti) himself embraced such an idealism has come to be disputed. What is clear is that the later Yogācāra philosophers work out a conceptual logic and a pragmatic epistemology that are supposed to be independent of such metaphysical questions as whether objects of awareness are merely internal to awareness or whether they also reflect external causes (see Epistemology, Indian schools of §1). Awareness guides action, and the touchstone of veridicality is success in action as shown by the coherence of the propositional content of one awareness with that of other awarenesses. The main criticism of representationalism is that it is otiose - as is also the direct realism of the Brāhmanical schools.

The direct realists, for their part, ably defend a contrary view of awareness, and voice criticisms of Yogācāra - including the pragmatism and scepticism of the late Yogācāra logicians and epistemologists - as well as of the earlier representationalism. We here focus on Nyāya (the 'Logic' school), although, especially with respect to attacks on Buddhist philosophy, Nyāya reasoners learned much from Mīmāṃsā(the 'Exegesis' school) (see Nyāya-Vaiśeṣika §6; MīmāṃsāČsect;2).

Awarenesses, according to Buddhists and Nyāya realists alike, are fleeting psychological episodes. So if they do not have extra-mental facts as content, then, since each awareness is itself a unique particular, linguistic practice (*vyavahāra*) could not be based on awarenesses. This is an unhappy ramification of the Buddhist theory. Communicable verbalization of awareness requires generalities or class characters as the content of awareness, because communication requires commonality in the experience of conversers (to talk to oneself would similarly require commonality among one's own experiential episodes). If each awareness has to itself content that is only an internal form, then each awareness, as itself a unique particular, will remain unverbalizable. According to Nyāya, awareness is *nirākāra*, 'without intrinsic form'; its content, including characters shared by things of the same type, is imparted to it by causal processes commencing with contact between sense organ and object.

The Buddhist representationalists, who, to their credit, saw the need for extra-mental causes of awareness content, still made two important mistakes, Nyāya advocates claim. First, generalities have to obtain in nature; neither awareness nor mentality can create the characters shared among things that we are aware of and that make communication possible (this thing as exhibiting the pothood that you from other experiences are acquainted with). Second, there is no need to postulate a third realm of mental figures, for to understand an awareness, itself a mental or internal event (properly, an episodic quality of the self or soul), as directly indicating facts, not mediated by mental figures, is the simpler hypothesis (*lāghavatva*). The occurrence of illusion does not establish such a third realm, because illusion can be explained on realist suppositions: due to an abnormality in a perceptual process, there is projection of a general character with which the subject is acquainted through prior experience and which is stored (associatively) in the subject's memory bank, projection on a particular that is being immediately experienced (see Error and illusion, Indian conceptions of §3).

The realist view is plainly vulnerable with respect to the role of memory it finds in illusion; the generality imparted to an awareness thereby is apparently better captured by a Yogācāra theory of a two-stage perceptual process, the first sensory and nonconceptual (involving only individuals or particulars), the second mental and conceptual (where salient groupings, or class characters, are imparted by the mind, in part based on human purposes). Philosophers of early Nyāya, in fact, struggled much with this, and tried, often confusedly, to concoct a similar two-stage realist theory. But the fourteenth-century 'New Logician' (*navya-naiyāyika*) Gaōgeśa (§2) managed to formulate a much clearer view of a pre-verbalizable stage of sensory awareness in which there is direct grasping of naturally obtaining generalities (and not only, as in the Yogācāra theory, particulars), followed by a verbalizable

stage in which these are attributed to particulars (see Sense perception, Indian views of §6).

3 Self-awareness

According to Nyāya, again in opposition to Yogācāra and also to Advaita Vedānta, self-awareness is not intrinsic to awareness, but is a matter of apperception (*anuvyavasāya*, literally 'after-cognition'), an awareness whose object is a previous awareness (that is, a 'scoped awareness', to use B.K. Matilal's happy phrase). Advaitins, such as the brilliant polemicist Śrīharṣa (*c.*1150), charge that the Nyāya view would make self-awareness impossible, in that as soon as one became aware of an awareness, A_1, the grasping awareness, A_2, not itself self-aware, would require an A_3 to be known, *ad infinitum*. The Advaita view, in contrast, is that every awareness is intrinsically self-aware (Yogcārins also defend this position). Moreover, awarenesses are infallibly known. Śrīharṣa argues, echoing the renowned Śaōkara (*c.*700, usually regarded as the greatest classical Advaitin), that if an awareness *qua* awareness could be doubted, then no resolution of any dispute would be possible. If anything is known, it must be awareness of awareness; awareness is self-luminous (see Śaōkara §2).

Gaōgeśa and other Nyāya philosophers respond by admitting the potential for a regress; it is simply that we normally have no call to make explicit in further apperception a lower-order apperception. We could do so, however, for as long as we wished to play that game. Normally we have no call to introspect, involved as we are in action and getting things done. Not every fact in the world is cognized by a human being. Similarly, not every awareness is apperceived. As the *Nyāyasūtra* indicates, however, some doubt does result from conflicts of theory, from the opposed positions of different schools, especially concerning the nature of awareness. Thus in philosophy we have special occasion to consult apperception to resolve higher-order doubts and disputes.

According to Gaōgeśa, in apperception, unlike in first-order awarenesses, the content of the scoped awareness is infallibly cognized as awareness content; that is to say, the scoped awareness is, *qua* awareness, known precisely as the phenomenon it is. Nyāya philosophers are generally fallibilists, taking the position that just about any bit of awareness content could prove to be erroneous. The exception is apperception, where the content of a previous awareness is infallibly known as awareness content. For example, the apperception verbalized as 'I took myself to be seeing a snake' will be veridical whether the scoped awareness' content (namely that something is a snake) obtains in fact. By taking this stance, Gaōgeśa is able to undercut the criticism of some of his opponents that Nyāya's realism about objects in the external world makes it blind to the infallible presentation of awareness to itself: Nyāya in fact holds that, *qua* subjective phenomenon, an awareness can be infallibly known. The view is also vital to Nyāya philosophers' being able to talk so discriminatingly about awarenesses, despite their direct realism.

Axiology

Axiology is the branch of practical philosophy which studies the nature of value. Axiologists study value in general rather than moral values in particular and frequently emphasize the plurality and heterogeneity of values while at the same time adopting different forms of realism about values. Historically, three groups of philosophers can be described as axiologists: the original Austrian and German schools of value phenomenologists; American theorists of value who offered an account of value which reduces it to human interests; and an English school, influenced by Austro-German phenomenology, which included such diverse figures as G.E. Moore, Hastings Rashdall and W.D. Ross. Recent philosophy has seen a resurgence of interest in value realism in the broadly axiological tradition.

1 Introduction

'Axiology' is a translation of the German *Axiologie*, which simply means 'theory of value'. Axiology is the branch of practical philosophy which seeks to provide a theoretical account of the nature of values, whether moral, prudential or aesthetic (see Values). Values are understood in their tradition to be the proper objects of practical attitudes, analogous to the way truth is the proper object of our theoretical judgments. Historically, there have been three important groups of philosophers whose work can be described under the heading of 'axiology'. One of these is the American school of John Dewey and C.I. Lewis (see Pragmatism in ethics). The American school was subjectivist; values were viewed as created by subjective interests, in the form of desires. The Austro-German and British traditions, in contrast, were primarily realist or objectivist (see Moral realism §§1).

2 The Austro-German school of phenomenology

Historically the earliest group are the value theorists of nineteenth-century Austria and Germany, a group which includes Franz Brentano, Alexius Meinong, Max Scheler, and Nicolai Hartmann. Their work has been neglected, not least because of a perceived distinction between 'analytic' and 'continental' philosophy, which came to dominate post-war analytical philosophy to the detriment of both traditions. These philosophers based their approach to practical philosophy on a 'psychological' or 'phenomenological' method which involves giving a precise description of one's experience, freed as far as possible from all presuppositions and all theoretical interpretation, and paying special attention to the objects of experience precisely as they are experienced (see Phenomenological movement). They aimed to give an account of the contents and objects of evaluative acts which paralleled the move towards the investigation of the contents and objects of theoretical judgments on the part of Husserl, Frege and other logical realists at the turn of the century.

The work on value of Brentano (1889) and Meinong (1917) was grounded in Brentano's revision of the medieval concept of intentionality, which he and his successors took to mean the directedness of thought upon its objects (see Intentionality). Mental acts, for Brentano, are built up out of three elements: the presentation of an object, for example a sense datum; a dimension of positive or negative belief in the existence of the object of the belief; and finally a third dimension called a 'phenomenon of interest'. Just as judgments may be positive or negative, so also phenomena of interest are divided into positive interest phenomena, or 'love', and negative interest phenomena, or 'hate'. Just as some judgments are 'correct' or 'incorrect' according to whether they are marked by a special quality of clear and distinct evidence, so acts of love and hate, too, may be correct or incorrect. Brentano sees the origin of all ethical knowledge as lying in our experience of correct love and hate. At the same time, with his student Christian von Ehrenfels, he emphasized the role of organic unity in constituting valued objects.

Meinong's theory is a refinement of Brentano's doctrine. Meinong, however, objectified Brentano's phenomena of interest, conceiving of the corresponding acts as having special objects of their own in the realms of value and 'oughtness'.

Complementing the Austrian emphasis on the psychological complexities of valuing, the German contributions of Scheler (1913, 1916) and Hartmann (1926) focus on describing the structures of valuable objects. However, both theories also contain a doctrine of the 'emotional a priori' in which emotion serves as an a priori principle of practical thinking, a view influenced by Lotze and by Brentano's theory of correct and incorrect emotions (see Lotze, R.H.). The phenomenological investigations of Scheler and Hartmann focus on the classification of the

objects of practical judgments into classes such as the ‘higher’ and the ‘lower’, on the basis of such criteria as permanence, fundamentality, universality and so on. Hartmann’s version of the theory has the merit of emphasizing the possibility of tension and conflict amidst this experienced plurality of values (see Moral pluralism). Scheler sought to provide a ‘material’ ethics doing justice to the vast plethora of different types of things that different agents in different cultures value. He also emphasized the religious aspects of the value pantheon.

3 The British axiological tradition

In the analytical tradition axiological theses are to be found above all in Moore’s *Principia Ethica* (1903), and in the writings of Rashdall and Ross (see Moore, G.E.). Both Moore and Rashdall were ‘ideal consequentialists’, whose account of right action sees rightness as consisting in the production of goodness (see Consequentialism). Moore’s axiological theses in *Principia* reflect to some degree the influence of the Austrian school which Moore admired: Moore’s much criticized account of the faculty of moral intuition includes a reference to feeling and the will (see Intuitionism in ethics); his account of goodness and beauty is indebted to Brentano, as is his account of ‘organic unities’ in value; Moore even offers an account of the structure of the value realm, although it is perhaps rather too committed to the idiosyncratic values of the Bloomsbury group to be entirely convincing.

Hastings Rashdall’s now neglected *Theory of Good and Evil* (1912) offers an account similar to that of Moore, with the emphasis falling not on organic wholes, but on states of consciousness as the ultimately valuable objects of our judgment. Interestingly, Rashdall also believes that all values are ultimately commensurable (see Rashdall, H.).

W.D. Ross (1930) was the third great mid-century English axiologist. While his historical reputation rests largely on his neo-Aristotelian account of duty, axiological themes nevertheless run throughout his work, not least because he exploited the principle of Moore’s argument against the definability of ‘good’ to argue that the term ‘right’ was similarly undefinable. Ross saw the term ‘good’ as attaching to states of affairs, whereas ‘rightness’ is predicated of acts. Ross offers a three-fold classification of values, combined with a thesis of value incommensurability that marked his divergence from Rashdall’s otherwise similar position (see Ross, W.D.; Right and good).

4 The eclipse of value theory

Value theory has been eclipsed in recent Anglo-American analytical philosophy for several reasons: first, the rise of evolutionary psychology; second, the dominance of rational decision theory; third, the dominance of meta-ethical scepticism about the place of values in the world; fourth, the problem of motivational internalism; and finally certain key changes in the modern view of morality itself.

Evolutionary psychology seems to offer an account of the evolution of our ‘moral sense’ that dispenses with any reference to objective values. Its apparent elimination of objective values on the grounds of their explanatory dispensability has offered a new impetus to ethical scepticism, as illustrated above all in the work of J.L. Mackie and Michael Ruse, although this interpretation of evolutionary theory has been strongly contested, for example by Robert Nozick. Nozick (1981) argues that an evolutionary account of the moral sense can no more dispense with values than an evolutionary account of perception can dispense with perceptual objects objectively present in the world.

Decision theory seems to be evaluatively neutral, formulating simply the rules a rational agent must employ to determine the means to established ends; it therefore seems to suggest that values are theoretically eliminable, replaceable by subjective preferences (see Decision and game theory §2). Susan Hurley (1989) and Henry S. Richardson (1994), among others, have argued that the theory of practical reasoning cannot be an autonomous theory which can dispense with reference to values. A central line of argument is that decision theory rests on an insufficiently realistic model of the psychology of practical agents and that a more realistic theory must necessarily refer to values. Hurley argues that the theory of practical reasoning embodied in contemporary decision theory cannot be an empirical theory, applicable to real world agents, unless supplemented by assumptions about what agents value.

Moral scepticism questions how values could be part of the world as described by natural science (see Naturalism in ethics §1); the sceptic cannot see the justification for postulating values as real entities. On this point David

Wiggins (1987) and John McDowell concur with the naturalistic realists known as the 'Cornell school', such as Richard Boyd and David Brink (1989). Evaluative properties are postulated just like any other kind of properties: they are theoretical entities which must earn their keep, ontologically, by playing a role in explaining the responses of a rational agent. However, the Cornell school add the further insistence that such properties must ultimately be naturalistically reducible. This claim is resisted by Wiggins and McDowell; the insight of their much misunderstood secondary property model for evaluative properties is that values may be subjective, in the sense of tied to anthropocentric interests of ours, but nevertheless real in the only way any property is real - by pulling its weight in successful explanations (see Moral realism §4-5).

The problem of motivational internalism marks a major point of divergence between the British and American versions of moral realism. If one accepts the intuition expressed by internalism to the effect that moral judgments necessarily have an impact on action, how can a perception of objective properties explain such a connection? The Cornell realists simply dispense with the intuition and claim that the link between judgment and motivation is contingent - the thesis of externalism (see Moral motivation §1). Wiggins and McDowell argue that the connection is secured via a model of the ideal agent, the virtuous person, who is both equipped to perceive moral properties and disposed to assign these perceptions authority in their practical deliberation. Such a model, in their view, offers a defensible version of internalism.

The last reason for the decline in axiology turns on the fact that objective values seem dispensable to a modern conception of the self as autonomous, a spontaneous creator of value, which values freedom and autonomy above all else (see Autonomy, ethical). The value theorist can, however, argue that those features of this modern view of morality that seem to make reference to values dispensable in fact rest on suppressed commitments to certain specific evaluative frameworks - frameworks within which our commitment to such values as autonomy and freedom make sense. This is the central argument of Charles Taylor's *Sources of the Self* (1989), which seeks to overcome the philosophical basis of what he correctly calls an 'ethics of inarticulacy', which is based on the modern values of procedural rationality and freedom, but which is, by its own lights, unable to articulate the ways in which our moral commitments are ultimately based in the theory of value.

5 The revival of value theory in recent moral philosophy

Powerful forces, both outside and inside moral philosophy, have conspired to marginalize value theory in contemporary moral philosophy. Yet the foregoing demonstrates that value theory has undergone a considerable revival in recent moral philosophy.

A strong influence on recent developments was the work of the émigré moral phenomenologist Aurel Kolnai; other 'transmitters' of the Austro-German tradition to Anglo-American moral philosophy were J.N. Findlay (1963), R.M. Chisholm and Maurice Mandelbaum. Kolnai's work has in turn influenced the account of moral knowledge found in the work of Wiggins and McDowell.

Quite independent 'theorists of value' in contemporary ethics are Platonists such as Iris Murdoch and Neo-Kantian theorists such as John Rawls and Robert Nozick. Nozick in particular has looked back to the Austrian and German schools of axiology as inspiration for his work, which even includes a delineation of the valuable 'facets of being', including such categories as 'richness', 'completeness' and 'amplitude', in the manner of Scheler and Hartmann.

Axiom of choice

The axiom of choice is a mathematical postulate about sets: for each family of non-empty sets, there exists a function selecting one member from each set in the family. If those sets have no member in common, it postulates that there is a set having exactly one element in common with each set in the family. First formulated in 1904, the axiom of choice was highly controversial among mathematicians and philosophers, because it epitomized 'non-constructive' mathematics. Nevertheless, as time passed, it had an increasingly broad range of consequences in many branches of mathematics.

1 History of the axiom

Consider a whimsical example, due to Bertrand Russell, illustrating the need for an axiom of choice (stated above). Suppose a millionaire buys as many pairs of socks as pairs of boots and suppose that at last he has infinitely many pairs of each. Then (1) he has exactly as many boots as he does pairs of boots, and (2) he has exactly as many socks as he does pairs of socks. To show (1), we make use of the fact that there is a rule to pick a boot from each pair (for example, the left one). To establish (2) we must be able to pick a sock from each pair. Leaving aside artificial devices, such as the position of socks in space, there is no way to distinguish a sock in each pair and hence no way to prove (2). The axiom of choice implies the existence of such a choice from each pair, even when no rule is available to make the choice.

Thus the axiom involves infinitely many choices from sets. Despite misunderstandings by some philosophers, it has nothing to do with a single choice from a set or even with a finite number of choices, since these are already validated by first-order logic. Nor does the axiom concern the empirical possibility of actually doing the choosing, although this red herring was once taken seriously.

When first formulated by Ernst Zermelo in 1904, the axiom of choice was highly controversial. It led a number of British, French and German mathematicians to consider the philosophical side of mathematics, and induced several of them, especially in France, to adopt various constructivist philosophies of mathematics (see Constructivism in mathematics). At issue was the question of what is meant by 'existence' in mathematics.

The axiom of choice also motivated the axiomatization of set theory. Concerned primarily to defend this axiom against its numerous critics and secondarily to avoid the contradictions recently discovered (see Paradoxes of set and property), Zermelo axiomatized set theory in 1908. The axiom of choice figured prominently in his axiomatization. It turned out that many mathematical theorems required the axiom, and quite a few were actually equivalent to it (see §3 below).

The axiom is intimately involved with the emergence of important techniques for constructing models of set theory in first-order logic. The first such technique (1938) was Kurt Gödel's constructible sets (see Constructible universe). The second (1963) was Paul Cohen's method of forcing. These techniques established that the axiom of choice is consistent with the usual axioms of set theory, but also independent from them.

2 Philosophical questions surrounding the axiom

Today almost all mathematicians accept the axiom of choice, although many still remark when they use it. Earlier, Zermelo defended the axiom against its critics on two grounds: its usefulness and its self-evidence. He remarked that it had already been widely used, without being formulated explicitly. Such widespread use, he argued, could only be explained by the axiom's self-evidence.

Opponents of the axiom had various views. Some, such as Emile Borel, accepted the axiom when applied to a denumerable family of sets, but rejected it when applied to a family of larger cardinality, such as the set of all real numbers. Others, including René Baire, tentatively accepted the real numbers but argued against the existence of the set of all subsets of the real numbers, from which subsets Zermelo's choices were made. Many opponents rejected the axiom because it provided no rule for making the choices. Apparently thinking of axioms in the traditional way as self-evident truths, they often failed to understand that the axiom is needed precisely when no rule is available.

Opponents were encouraged by the axiom's counter-intuitive consequences. The most vivid of these was the

Banach-Tarski paradox, whereby a sphere *S* can be decomposed into a finite number of pieces and reassembled into two spheres each of the same size as *S*. The three-dimensionality is important here, since such a decomposition cannot be done with a two-dimensional figure such as a circle. Euclidean geometry also plays a role, since hyperbolic geometry (in which the parallel postulate is false) allows the various counter-intuitive decompositions without using the axiom.

The irony for the axiom's opponents was that if set theory is understood in a sufficiently constructivist way, then the axiom is true. In the extreme case, when all sets are finite, the axiom is true but trivial. If set theory is restricted to Gödel's constructible sets, then again the axiom is true but now distinctly non-trivial. It is only when set theory is taken in a non-constructive way that the axiom might be false. Even in intuitionism, various restricted forms of the axiom are true, but their meaning is changed since the underlying logic is not first-order logic (see Intuitionism).

3 Mathematical theorems that need the axiom

Zermelo introduced the axiom of choice to prove the well-ordering theorem: every set can be well-ordered (see Set theory). Previously Georg Cantor had assumed this well-ordering theorem as a 'law of thought', but mathematicians had been sceptical. Zermelo showed that the well-ordering theorem follows from an axiom that is conceptually much simpler: the axiom of choice.

The axiom of choice is vital to the arithmetic of infinite cardinal numbers. In particular, it is equivalent to the proposition that if two cardinals are unequal, then one is greater than the other. It is needed in order to define the addition or multiplication of infinitely many cardinals.

Various definitions of the finiteness of a set involve the axiom. The usual definition says that a set *M* is finite if it is empty or if there is some counting number *n* such that *M* can be put into one-one correspondence with $\{1, 2, \ldots, n\}$; otherwise *M* is infinite. Richard Dedekind formulated the first definition that made no use of numbers. A set *M* is said to be 'Dedekind-infinite' if there is a one-one function from *M* to a proper subset of itself; otherwise, *M* is 'Dedekind-finite'. The philosophical significance of this definition is not only that it dispensed with numbers but also that the infinite is defined positively, rather than as the absence of some property. Intuitively, a set should be finite if and only if it is Dedekind-finite, but this equivalence requires a weak form of the axiom of choice. Moreover, there are definitions of finiteness whose equivalence to the usual definition is itself equivalent to the axiom.

The axiom permeates most branches of mathematics, except geometry. Without the axiom, much of algebra, analysis and topology would not exist. A typical algebraic theorem equivalent to the axiom is that every vector space has a basis. In topology, an equivalent theorem is the proposition that the product of compact topological spaces is compact. In analysis, we rarely need the full strength of the axiom but can get along with a weaker assumption: the principle of dependent choices. This principle asserts the existence of a sequence of choices, each depending on the finitely many choices previously made.

In logic, the axiom of choice also plays an essential role in many important results. It is needed to prove the completeness theorem for first-order logic, as well as the compactness theorem and the completeness theorem for propositional logic, provided that the set of primitive symbols of the logic may have any infinite cardinality. With such a language, the downward Löwenheim-Skolem theorem is also equivalent to the axiom: every model of an infinite set *M* of sentences has a model whose cardinal is at most that of *M* (see Löwenheim-Skolem theorems and nonstandard models; Model theory). It is ironic, and of philosophical significance, that the axiom must be used to prove, via forcing, that there exists a model of set theory in which the axiom is false.

The axiom of choice is implied by various stronger propositions in set theory, such as the axiom of constructibility and the generalized continuum hypothesis (see Constructible universe; Continuum hypothesis). Another such proposition, which, unlike those two, is very intuitive, was discovered by John von Neumann: a class *M* is a proper class (that is, not a set) if and only if *M* can be put into one-one correspondence with the class of all sets. This beautiful proposition turns Burali-Forti's paradox (see Paradoxes of set and property) into an argument that the universe of all sets is well-ordered, and illustrates how paradoxical results, if viewed correctly, can often be transformed into useful theorems.

Ayer, Alfred Jules (1910-89)

A.J. Ayer made his name as a philosopher with the publication of Language, Truth and Logic in 1936, a book which established him as the leading English representative of logical positivism, a doctrine put forward by a group of philosophers known as members of the Vienna Circle. The major thesis of logical positivism defended by Ayer was that all literally meaningful propositions were either analytic (true or false in virtue of the meaning of the proposition alone) or verifiable by experience. This, the verificationist theory of meaning, was used by Ayer to deny the literal significance of any metaphysical propositions, including those that affirmed or denied the existence of God. Statements about physical objects were said to be translatable into sentences about our sensory experiences (the doctrine known as phenomenalism). Ayer further claimed that the propositions of logic and mathematics were analytic truths and that there was no natural necessity, necessity being a purely logical notion. Finally the assertion of an ethical proposition, such as 'Stealing is wrong', was analysed as an expression of emotion or attitude to an action, in this case the expression of a negative attitude to the act of stealing.

During the rest of his philosophical career Ayer remained faithful to most of these theses, but came to reject his early phenomenalism in favour of a sophisticated realism about physical objects. This still gives priority to our experiences, now called percepts, but the existence of physical objects is postulated to explain the coherence and consistency of our percepts. Ayer continued to deny that there were any natural necessities, analysing causation as consisting in law-like regularities. He used this analysis to defend a compatibilist position about free action, claiming that a free action is to be contrasted with one done under constraint or compulsion. Causation involves mere regularity, and so neither constrains nor compels.

1 Life

A.J. Ayer was educated at Eton and Christ Church, Oxford. As an undergraduate he formed an interest in philosophy and was encouraged by Gilbert Ryle to spend some time in Vienna in 1932. It was at this time that he attended meetings of the Vienna Circle and was converted to logical positivism (see Logical positivism §4; Vienna Circle §2). During the Second World War he spent most of his time in military intelligence. After the war he became Grote Professor of Philosophy of Mind and Logic at University College, London, leaving London in 1959 to become the Wykeham Professor of Logic at New College, Oxford. During this time Ayer became a well-known public figure, appearing in radio and television programmes, and he was knighted in 1970. Ayer took a special interest in encouraging younger philosophers, to whom he was always known as 'Freddie'; and well after his retirement in 1978 he continued to enliven the annual British philosophical meetings (the 'Joint Sessions'). He married four times, including one remarriage, and wrote two autobiographies (1977; 1984).

Philosophically Ayer saw himself as being part of the tradition of British empiricism started by Locke and Hume and continued by Russell. He was a prolific writer, contributing especially to epistemology, but also producing many articles in the philosophy of science and philosophy of mind. In addition he wrote books on Hume, Russell and Moore, Wittgenstein, and the American pragmatists, Peirce and James.

2 Verificationism

The anti-metaphysical doctrines of logical positivism attracted Ayer at least partly because of his adverse reaction to the British idealists F.H. Bradley and McTaggart, who denied the reality of matter, space and time (see Bradley, F.H. §5; McTaggart, J.M.E. §3). Positivism provided Ayer with the weapon he needed to denounce such claims as metaphysical nonsense. That weapon was the verificationist theory of meaning, which divided meaningful sentences into those that were analytically true (or false) and so known a priori, and those that expressed propositions that were empirically verifiable. Sentences purporting to express the traditional metaphysical views were deemed to be either disguised analytic statements, reflecting a decision to use words in a certain way, or nonsensical. Ayer's first book, *Language, Truth and Logic* (1936), formulated the verificationist criterion of meaning and pursued its consequences for various philosophical controversies. The book became notorious partly because of its confident and aggressive style, and partly because of the distinctive theses endorsed concerning the nonsensical nature of assertions of God's existence and the analysis of ethical statements as expressive of our emotions, with no cognitive significance. Given the controversial nature of these claims, much rested on a satisfactory formulation of the positivist criterion of meaning, the verification principle.

In the first edition of *Language, Truth and Logic*, Ayer stipulated that a proposition is strongly verifiable if and only if its truth can be conclusively established by experience, and that a proposition is weakly verifiable if and only if it is made probable by experience. Ayer sharpened this definition of weak verifiability to the following: a proposition is weakly verifiable if and only if an observation statement is deducible from it in conjunction with other premises, and not deducible from those other premises alone. This definition proved too permissive: take *any* sentence '*S*' and observation statement '*O*'; the latter will follow from '*S*' and 'if *S* then *O*', without following from 'If *S* then *O*' alone. To remedy this defect Ayer reformulated the criterion in the introduction to the second edition of *Language, Truth and Logic* (1946). Here he calls a statement 'directly verifiable' if it is either itself an observation statement, or, in conjunction with other observation statements, it entails at least one observation statement not deducible from these other observation statements alone. And a statement is 'indirectly verifiable' if, in conjunction with other premises, it entails a directly verifiable statement which is not deducible from these other premises alone, and provided that these premises are themselves either analytic, or directly verifiable, or independently established as indirectly verifiable. A statement was meaningful if and only if it was either directly or indirectly verifiable in the above sense.

Unfortunately for Ayer this reformulated criterion of meaning was shown to be too permissive as well. Alonzo Church (1949) showed that one can again render *any* statement meaningful according to the reformulated criterion. Let O_1, O_2 and O_3 be logically independent observation statements and *S* be any statement.

(1) $(\sim O_1 \;\&\; O_2) \vee (O_3 \;\&\; \sim S)$

is then directly verifiable ((1) in conjunction with O_1 entails O_3). As long as O_2 does not follow from (1) alone, *S* is then indirectly verifiable, as O_2 follows from *S* and (1), and (1) is directly verifiable. Furthermore, if O_2 follows from (1) alone then O_2 follows from $O_3 \;\&\; \sim S$, which implies that $\sim S$ is directly verifiable, since O_2 and $O_3 \;\&\; \sim S$ are logically independent. Ayer acknowledged the force of this argument, but retained his belief that verifiability was crucial to meaning. He thought that once the theory of confirmation had been worked out in detail it would be possible to overcome the problems posed by Church.

Most of *Language, Truth and Logic* drew out the consequences of Ayer's verificationist theory of meaning. Material objects were construed as being constituted by actual and possible sense-data. Statements about other minds were meaningful on the basis of their verification by behaviour, whereas statements about one's own mind were not analysed as having a behaviourist basis. As a consequence mental predicates had different meanings, depending on whether they were used in judgments about others or oneself. Past-tense statements were originally thought to be rules for the prediction of the experiences which would verify them, a view which made them translatable into propositions about present and future experience. Ayer retracted this in the introduction to the second edition, where he asserted that the present unobservability of such events was accidental, so past-tense statements could be interpreted as analogous to statements about spatially distant events which we could not see. He proposed that they be analysed as being verifiable by those experiences we would have if we were to 'travel' to the historical event being described (see Meaning and verification §§2-4).

Two categories of expression were given fairly extended treatment in *Language, Truth and Logic*: those of logic and mathematics, and those of morality. The truths of logic and mathematics were too important to be declared meaningless, but Ayer resisted the thought that they were empirically verified. Instead such necessary truths were classified as analytic truths, and as such their truth depended solely on facts about how we used certain terms. For example, given that '$\rightarrow$' had been given a meaning in Russell and Whitehead's system of logic, the a priori proposition '$(q \rightarrow (p \rightarrow q))$' was analytically true. The merits of such an account were famously called into question by Quine (1936, 1951) (see Necessary truth and convention §1; Quine, W.V. §8). The category of moral statements was approached differently, and will be discussed later.

3 Perception

Verification of sentences proceeded by singling out a favoured class of sentences - 'observation statements' or 'basic sentences', which were the principal verifiers. There was a great deal of controversy among the positivists as to the nature of these sentences. Given the role they are assigned, they cannot themselves be verified by another set of sentences, so they have to be either self-verifiers or chosen independently of a verification criterion. The latter strategy - conventionalism - was favoured by Otto von Neurath, who persuaded Carnap of its virtues (see

Conventionalism §1). Ayer consistently opposed it, arguing that the use of any independent criterion, such as choosing those basic statements agreed upon by scientists, would require the exercise of some judgment as to what had been agreed (Ayer 1937). This judgment would itself require support; so the proposed independent criterion was accused of presupposing verification by experience. The self-verification option was the only one available.

Ayer's own thought about the nature of basic statements changed after his initial statement of it in *Language, Truth and Logic*, but he never gave up on the idea that the foundations of empirical knowledge were to be found in our sensory experience, in sense data or qualia. Sense-datum statements (or observation statements) formed the foundation because they were minimally committal: their function was simply to record what appeared to us without implying anything further about what may be true. Ayer vacillated as to whether such statements were infallible, but decided that the possibility of their fallibility did not make them unsuitable for their role as basic statements. What was essential was that they could not be false in one of the ways in which statements about physical objects could be false, through the person making the statement being misled by appearances. The beauty of sense-data was that their reality coincided with their appearance. Ayer's account of sense-data was criticized by J.L. Austin (1962), to which Ayer responded vigorously in 'Has Austin Refuted the Sense-Datum Theory?' (1967).

What of our knowledge of physical objects? In *Language, Truth and Logic* and *The Foundations of Empirical Knowledge* (1940) Ayer defended phenomenalism, the view that anything said about ordinary physical objects was translatable into a series of statements about sense-data. After the war he rejected phenomenalism on the grounds that no set of sense-datum statements could entail the truth of a statement about a physical object. In *The Central Questions of Philosophy* (1973) Ayer eventually settled for a form of realism which he called 'sophisticated realism' and which he differentiated from naïve realism, which holds that we directly perceive physical objects. For Ayer, our perceptual judgments about physical objects are always dependent upon an inference, usually implicit, from some more secure base. He claimed that it was possible to describe this base in ways which did not commit one to the existence of any physical objects, and named this epistemological basis the primary system. It consisted of neutral (that is, neither public nor private) qualia, such as loudness or greenness. These qualia form patterns in places and times, from which we postulate the more elaborate secondary system, a theory of 'visuo-tactual continuants'. Once this has been done the experiential basis is reinterpreted as consisting of states of the perceiver which are caused by the postulated physical objects. Critics have held that this view of perception is untrue to the facts of perceptual experience, which they claim is more likely to be veridically characterized as consisting in our awareness of the objects we are looking at, rather than these being postulated to exist on the basis of some more primitive sensory experience (see Perception §§1-2; Phenomenalism §1; Qualia §1; Sense-data §1).

4 Knowledge

In *The Problem of Knowledge* (1956) Ayer claimed that person *a*'s knowledge that *p* could be analysed into: (1) *p* being true; (2) *a* being sure that *p*; and (3) *a* having the right to be sure that *p*. Clause (1) is deemed necessary because we withdraw attributions of knowledge if we discover that the belief is false. Clause (2) is thought to be more or less obvious. Counterclaims trade on the fact that we often act on the basis of knowledge which we do not consciously admit. Clause (3) is inserted in order to avoid attributing knowledge to the lucky guesser - one who believes that *p*, and *p* happens to be true, but where the believer had no right to the belief. Ayer claimed that these three clauses were necessary and sufficient for knowledge.

Most of the subsequent discussion has concentrated on the sufficiency claim. Edmund Gettier (1963) produced examples which appeared to satisfy the three clauses but which did not seem to be a case of knowledge. One such example is that of a man, Smith, who has strong evidence for the belief (1) that Jones owns a Ford. On the sole basis of this evidence Smith forms the further belief (2) that Jones owns a Ford, or Brown is in Barcelona. Jones, as it happens, does not own a Ford, but Brown is in Barcelona. The evidence justifies Smith in believing (1), so justifies his belief in (2), and (2) is true. But, Gettier alleges, Smith does not *know* (2), so Ayer's analysis is wrong. Ayer thought that this type of example did not show that his analysis of knowledge was wrong, but simply that the notion of justification was trickier than initially thought. Once this had been sorted out, the counterexamples would be seen to involve unjustified beliefs (see Knowledge, concept of §4).

5 Ethics

One of the most controversial of the theses advocated by the early Ayer was that moral judgments lacked cognitive significance - they were not verifiable by any distinctive 'moral' facts or experience. They functioned, Ayer claimed, to express our emotions or attitudes. When we say 'Killing people is wrong', we are simply expressing a negative attitude to the actions of killing people. Analogously, when we say 'John is a good person' we are just evincing a positive attitude to John. This became known as the 'boo/hurrah' theory of ethics, as Ayer suggested that negative and positive moral judgments had the same cognitive status as saying 'boo!' or 'hurrah!'. Ayer continued to hold the emotivist theory, as it became known, with the slight emendation that the expression of attitude had a prescriptive element built into it. A positive moral judgment both expressed a 'pro-attitude' and enjoined others to have the same attitude. Ayer also made it clear that the attitude expressed was towards a *class* of acts, so when killing was condemned it was not a particular killing, but all killings, which were condemned.

Emotivism, and more generally the non-cognitivism about ethics which it espoused, has been widely discussed in the subsequent literature. One of the most difficult problems any such theory faces is to account for the status of moral expressions when they clearly do not have the force of expressing an emotion, as when they appear in conditionals. If somebody says, 'If stealing is wrong, then nobody ought to steal', there is no straightforward way of construing the meaning of the component sentence 'Stealing is wrong' as consisting just in the expression of emotion, since the person uttering the conditional may not have any negative attitude towards stealing. It is still a matter of some discussion as to whether this problem destroys the emotivist theory. An additional problem is whether the emotivist theory is accurate in its description of another facet of moral discourse, and that is moral argument. We seem to have moral disputes with one another about the correctness of our moral actions and judgments. On the emotivist theory these arguments are not about moral facts, so they were interpreted by Ayer as either being genuine arguments about nonmoral facts or not being genuine arguments (see Emotivism).

Ayer was puzzled as to whether we were morally responsible for our actions or not. It appears as though determinism, the thesis that all our actions are caused, destroys moral responsibility. We should not be held responsible for what we cannot help doing. On the other hand denying determinism did not seem to provide much support for responsibility either - making our actions independent of causal control made them independent of control by our minds, so again holding anybody morally responsible for what they cannot control seems misplaced. Ayer sought refuge in compatibilism, the thesis that determinism and freedom are reconcilable. He claimed that the mistake made by incompatibilists was to think that actions being caused entailed that they were compelled or constrained. For Ayer, causation was simply correlation of events, not involving any necessary connection between the events, and so an action could be caused without being compelled. Compulsion and free action were to be distinguished by the type of causation of involved. Ayer remained puzzled about whether this was sufficient for our ordinary concept of moral responsibility to have application (see Free will §1).

GRAHAM MacDONALD

List of works

Ayer, A.J. (1936) *Language, Truth and Logic*, London: Gollancz; 2nd edn, 1946.(The first classic statement of Ayer's positivist philosophy. The second edition contains an important new introduction amending the verification principle.)

Ayer, A.J. (1937) 'Verification and Experience', *Proceedings of the Aristotelian Society* 46: 137-56.(An attack on conventionalist approaches to basic statements.)

Ayer, A.J. (1940) *The Foundations of Empirical Knowledge*, London: Macmillan.(Contains Ayer's most fully worked-out phenomenalism.)

Ayer, A.J. (1954) *Philosophical Essays*, London: Macmillan.(Essays on freedom, phenomenalism, basic propositions, utilitarianism, other minds, the past and ontology.)

Ayer, A.J. (1956) *The Problem of Knowledge*, London: Macmillan.(Formulates and defends Ayer's account of knowledge, with a discussion of scepticism.)

Ayer, A.J. (1963) *The Concept of a Person and Other Essays*, London: Macmillan.(Contains essays on truth, privacy and private languages, laws of nature, the concept of a person, and probability.)

Ayer, A.J. (1968) *The Origins of Pragmatism*, London: Macmillan.(On the American pragmatists Peirce, James and Dewey.)

Ayer, A.J. (1969) *Metaphysics and Common-Sense*, London: Macmillan.(Essays on knowledge, man as a subject for science, chance, philosophy and politics, existentialism, metaphysics, and Austin on the sense-datum theory.)

Ayer, A.J. (1971) *Russell and Moore: The Analytical Heritage*, London: Macmillan.(An extended essay on the origins of analytical philosophy.)
Ayer, A.J. (1972a) *Probability and Evidence*, London: Macmillan.(A concise presentation of Ayer's seminal work on the theory of probability and confirmation.)
Ayer, A.J. (1972b) *Bertrand Russell*, London: Fontana.(An introduction to Russell's philosophy.)
Ayer, A.J. (1973) *The Central Questions of Philosophy*, London: Weidenfeld.(An advanced introduction to major philosophical issues, such as perception, knowledge, freedom and morality.)
Ayer, A.J. (1977) *Part of my Life*, London: Collins.(An autobiographical account of Ayer's life up to his appointment to the Wykeham Chair of Logic at Oxford University.)
Ayer, A.J. (1980) *Hume*, Oxford: Oxford University Press.(A brief introduction to the philosophy of David Hume.)
Ayer, A.J. (1982) *Philosophy in the Twentieth Century*, London: Weidenfeld.(Ayer's views on the major developments in twentieth-century philosophy.)
Ayer, A.J. (1984) *More of My Life*, London: Collins.(The second and final part of Ayer's autobiography.)

Bachelard, Gaston (1884-1962)

One indication of the originality of Bachelard's work is that he was famous for his writings both in the philosophy of science and on the poetic imagination. His work demonstrates his belief that the life of the masculine, work-day consciousness (animus), striving towards scientific objectivity through reasoning and the rectification of concepts, must be complemented by the life of a nocturnal, feminine consciousness (anima), seeking an expanded poetic subjectivity, as, in reverie, it creates the imaginary.

In common with other scientist-philosophers writing in the first half of the twentieth century, Bachelard reflected on the upheavals wrought by the introduction of relativity theory and quantum mechanics. The views at which he arrived were, however, unlike those of his contemporaries; he argued that the new science required a new, non-Cartesian epistemology, one which accommodated discontinuities (epistemological breaks) in the development of science. It was only after he had established himself as one of France's leading philosophers of science, by succeeding Abel Rey in the chair of history and philosophy of science at the Sorbonne, that Bachelard began to publish works on the poetic imagination. Here his trenchantly anti-theoretical stance was provocative. He rejected the role of literary critic and criticized literary criticism, focusing instead on reading images and on the creative imagination.

1 An unconventional philosopher

Gaston Bachelard did not enter philosophy through the standard French academic channels. Perhaps because of this, his work is unconventional, both in style and in range of subject matter. Bachelard was born and spent his childhood in Bar-sur-Aube, Champagne. From 1903 until the outbreak of the First World War he worked for the postal service and pursued scientific studies, receiving his *licence* in mathematics in 1912. He was drafted in 1914 and served in the army for the duration of the war. In 1919 he returned to Bar-sur-Aube to teach physics and chemistry at the local college. He had become interested in philosophy and received his *licence* in 1920, his *agrégation* in 1922 and his doctorate, written under the direction of Abel Rey and Léon Brunschvicg, in 1927. From 1930 until he moved to the Sorbonne in 1940 to succeed Rey in the chair of history and philosophy of science, he taught philosophy at the University of Dijon.

Bachelard's influence on philosophy in France has been much greater than accounts of contemporary French philosophy might suggest. He published twelve books on the philosophy of modern science, two on time and consciousness and nine on poetic imagination. These have been widely read, not least because they became an established part of the French university philosophy syllabus. When Bachelard retired from the Sorbonne in 1954, Georges Canghuilhem succeeded him in the chair of history and philosophy of science, and built on Bachelard's approach in his own work in the life sciences. Between them, Bachelard and Canghuilhem recast the disciplines of epistemology, history and philosophy of science in a way which, as Foucault has insisted, is essential to understanding not only his own work, but also that of Althusser and the followers of Lacan. In France, Bachelard has been criticized by postmodernists for remaining faithful to some of the methods of critical philosophy, and by Marxists for his humanism. His works on poetics inspired many of the French New Critics (see French philosophy of science §§1-2).

2 The new scientific spirit

To have taught science in the early part of the twentieth century is to have experienced dramatic changes in the character of physics and chemistry. Relativity theory and quantum mechanics did not represent simple additions to, or corrections of, existing science; their acceptance entailed the disruption of the whole framework of classical physics, requiring modifications in the concepts of space, time, causality and substance. These are the concepts which, according to Kant, are constitutive not merely of the framework of classical physics, but of our conception of the physical world. As such they are vital to the way in which the distinction is drawn between inner and outer, subject and object. Bachelard's epistemology is the result of absorbing the radical implications of these developments.

The fact that physics has reworked the very categories which Kant took to be a priori, grounded in the nature of the rational subject, invalidates any philosophy which starts from the presumption of a fixed rational framework,

whether found in formal logic, the structures of discourse or the rational subject. Similarly, Bachelard argues, science has reworked its empirical base. Sensory observation of given, natural objects has been replaced by the technologically mediated preparation of laboratory objects and phenomena. The objects of scientific investigation are made, not found; they are defined via their method of preparation or technical detection. We have passed from phenomenology to phenomeno-technique. Modern science thus requires us to put aside any epistemology erected on the foundation of the empirically given, whether sense-data or naturally occurring phenomena.

The epistemology of modern science cannot, therefore, be accommodated within a foundational epistemology, whether rationalist or empiricist; it is necessary to move to the open rationality of a non-Cartesian epistemology. As Bachelard reaches this conclusion he is led to introduce new concepts expressed in unfamiliar terminology: 'epistemological break' ('rupture'), 'epistemological value', 'epistemological obstacle', 'recurrent history' and the distinction between 'lapsed' and 'sanctioned' knowledge (see Incommensurability §1; Kuhn, T.S. §2-3).

Bachelard finds the clearest examples of what he calls 'dialectical reasoning' in mathematics. This is the reasoning characteristic of the open rationality of the new scientific spirit, which must reject the closed rationality of classical science as it moves beyond it and is aware of its own transitions. Bachelard's sense of dialectic is very much his own, and is not to be confused either with Hegelian or Marxist dialectic. A dialectical move, such as that from Euclidean to non-Euclidean geometry, takes one from a limited system, a framework which is closed in a certain respect, to one which is more general by being open in this respect. A dialectical development constitutes an 'epistemological break' because it introduces cognitive discontinuities, forcing far-reaching conceptual innovations on the one hand and reorganization and re-evaluation of cognitive fields on the other. In the case of geometry, the terms 'straight line' and 'space' continue to be used, but current concepts stand in no simple logical relation to their Euclidean/Newtonian predecessors. Although a straight line may still be the shortest distance between two points, the characteristics of lines with this property are now systematically related to the character of the space in which they occur. Moreover, a clear distinction is made between mathematical spaces and physical space, where previously there had been what, with hindsight, we judge to have been a complex but unclarified relation, presumed to be unproblematic only because it was taken for granted. In this sense the concept of space has been 'rectified' or 'corrected'.

The discontinuity involved in this epistemological break is not merely a disruption of logical relations; it requires a re-evaluation both of what was taken in the past to be geometrical knowledge, and of the relation between physics and mathematics. The 'epistemological value' attached to past proofs changes. The deductions are not discarded, but Euclid's theorems can no longer be treated as demonstrations of the properties of physical space. A dialectically advancing science will thus engage in periodic reassessments of the epistemological value to be attached to past science, or to what was in the past thought to be science, giving rise to what Bachelard calls 'recurrent history' of science. This history is evaluative; it evaluates the past of science from the standpoint of the present, distinguishing between those parts of past science which are 'sanctioned' (as having constituted progress) and those which are ignored because they are no longer valued ('lapsed science').

'Epistemological obstacles' are those (subjective) factors which contributed to the conviction that, for example, the parallel postulate was a necessary truth, something not open to questioning. They can only be identified with hindsight, after a break has been made and accepted as constituting a progressive move (a move towards greater objectivity). The factors which made the move difficult, which contributed to the closure of thought, then appear as factors which had to be overcome if progress was to be possible. These factors are necessarily hidden to consciousness while they are operative, since they result in the perception of something as self-evident, as beyond question. Epistemological obstacles thus have to be sought not in the cognitive foundations of a discipline, but among the various factors which play a role in shaping thought without our being aware of their operation. So epistemology has to concern itself with factors which condition and limit thought but which operate on a non-conscious, noncognitive level; it cannot restrict itself to considering only logical relations between concepts. Objective knowledge is progressively acquired by overcoming epistemological obstacles; this takes place on the borders of the conscious and the unconscious, between reflective theory and unreflective practice, between subject and object, and involves a continual redrawing of the line between them.

3 Dreamers and thinkers, images and concepts

To move beyond the boundaries set by current concepts, even the scientist must dream or engage in reveries. In

Bachelard's opinion, mathematics provides the space within which modern scientists dream. The two aspects of Bachelard's work come together in the figure of the creative thinker who must also be a dreamer and they do so in a way which gives a pivotal role to his highly original philosophy of mathematics, an aspect of his work which has received too little attention.

The axes of poetry and science are, Bachelard says, opposed in the sense that the very law of poetry is to go beyond thought, to take a voyage into the infinite, into an inner realm in which the unreal becomes real, in which images are forged and projected onto the external world. It is in this sense that mathematics is the poetry of science, and this is possible because, and to the extent that, here, as for Kant, there is a special relation between pure formal imagination and the construction of concepts. But even as scientists need to dream to go beyond, and ultimately extend, the boundaries of thought, so too their reveries may take them back to primordial themes, resistant to the teachings of scientific experiment, setting up resistances (epistemological obstacles) to psychological evolution. Drawing on elements of Jung's psychoanalytic theory, Bachelard wants to remind us of the power of elemental images and of the alchemist behind every engineer.

The life of concepts is essentially public. Within scientific communities conceptual boundaries are set by their logical interrelationships. These may be implicitly embedded in reasoning practices and rational standards, or explicitly codified in axioms, law, principles and definitions. The public role of concepts in the quest for objective knowledge is itself open to critical conceptual investigation. The life of images is, however, subjective and private (nocturnal). This is why Bachelard insists that the intellectual criticism of poetry can never lead to the centre where poetic images are formed, hence the image can only be studied through the image, by allowing images to gather in a state of reverie. Bachelard's own writing brilliantly evokes such gatherings of images. It is a form of writing which one cannot respect if one attempts to summarize its content. Bachelard concludes his *La poétique de la rêverie (Poetics of Reverie)* (1960) by saying, 'Since it was written in anima, we would wish that this simple book be read in anima'. And, as he explained at the beginning:

> It is *Anima* who dreams and sings. Dreaming and singing, that is the work of its solitude. Reverie - not the dream [*rêve*] - is the free expansion of all *anima*. It is doubtless with the reveries of his *anima* that the poet manages to give his *animus* ideas the structure of a song, the force of a song.
>
> From that point on, how can we read what the poet has written in an *anima* reverie without *anima* reverie? And that is how I justify not being able to read poets except by dreaming.

([1960] 1971: 67)

MARY TILES

List of works

Bachelard, G. (1928a) *Essai sur la connaissance approchée (Essay on Approximate Knowledge)*, Paris: Vrin. (Gives Bachelard's views on mathematics; these shaped his philosophy of science. He also indicates an approach to induction which differs significantly from anything developed in the analytic philosophy of science tradition.)

Bachelard, G. (1928b) *Étude sur l'évolution d'un problème de physique: la propagation thermique dans les solides (Study of the Evolution of a Problem in Physics: The Propogation of Heat in Solids)*, Paris: Vrin.(This gives a sense of Bachelard's early views as they emerge in the context of a study in the history of physics.)

Bachelard, G. (1929) *La valeur inductive de la relativité (The Indicative Value of Relativity)*, Paris: Vrin.(Here we find the first full exposition of the 'epistemological break (or rupture)'. Bachelard insists on the newness of the theory of relativity and on the way in which it breaks with past thought.)

Bachelard, G. (1932a) *Le pluralisme cohérent de la chimie moderne (The Coherent Pluralism of Modern Chemistry)*, Paris: Vrin.(An essay in historical epistemology.)

Bachelard, G. (1932b) *L'intuition de l'instant: étude sur la 'Siloë' de Gaston Roupnel (Intuition of the Insistent: A Study of Gaston Roupnel's 'Siloë')*, Paris: Gonthier.(Bachelard argues against Bergson's isolation of the subject from its world, rejecting his conception of pure consciousness and pure duration.)

Bachelard, G. (1933) *Les intuitions atomistiques: essai de classification (Atomisitic Intuitions: A Classification)*, Paris: Vrin.(Another example of the way in which Bachelard uses the history of science as a vehicle for exploring its epistemology.)

Bachelard, G. (1934) *Le nouvel esprit scientifique*, Paris: Presses Universitaires de France; trans. A. Goldhammer, *The New Scientific Spirit*, Boston, MA: Beacon Press, 1985.(A useful introduction to Bachelard's philosophy

of science. It is a forceful expression of the idea that scientific reality is dialectically related to scientific reason.)

Bachelard, G. (1936) *La dialectique de la durée (The Dialectic of Duration)*, Paris: Presses Universitaires de France.(In a further move in his polemic against Bergson, Bachelard turns to the adventures of consciousness. The self-proclaimed aim of the work is to present a propaedeutics for a philosophy of space.)

Bachelard, G. (1937) *L'expérience de l'espace dans la physique contemporaine (The Experience of Space in Contemporary Physics)*, Paris: Presses Universitaires de France.(Critically examines the role of space in substantiating realist views of science.)

Bachelard, G. (1938a) *La psychanalyse du feu*, Paris: Gallimard; trans. A.C.M. Ross, *The Psychoanalysis of Fire*, Boston, MA: Beacon Press, and London: Routledge & Kegan Paul, 1964.(Intended as a companion to 1938b. This marks a turning point in Bachelard's work; he begins to develop a theory of poetic imagination and at the same time discusses fire as an example of an epistemological obstacle.)

Bachelard, G. (1938b) *La formation de l'esprit scientifique: contribution à une psychanalyse de la connaissance objective (The Formation of the Scientific Spirit: A Contribution to a Psychoanalysis of Objective Knowledge)*, Paris: Vrin.(A pivotal work, dealing with the boundaries between subjective and objective in the construction of scientific knowledge. Here Bachelard introduces and develops the concept of an epistemological obstacle.)

Bachelard, G. (1939) *Lautréamont*, Paris: José Corti; trans. R. Duprée, *Lautréamont*, Dallas, TX: The Dallas Institute of Humanities and Culture Publications, 1984.(An exploration of analogies between the activities of scientists and poets. Mathematics and poetry are explicitly compared in the context of a discussion of Lautréamont's dynamic imagination.)

Bachelard, G. (1940) *La philosophie du non: essai d'une philosophie du nouvel esprit scientifique*, Paris: Presses Universitaires de France; trans. G.C. Waterston, *The Philosophy of No: A Philosophy of the New Scientific Mind*, New York: Orion Press, 1968.(Contains probably the clearest account of what Bachelard means by dialiectic and the dialectical development of modern science.)

Bachelard, G. (1942) *L'eau et les rêves: essai sur l'imagination de la matière*, Paris: José Corti; trans. E. Farrell, *Water and Dreams: An Essay on the Imagination of Matter*, Dallas, TX: The Dallas Institute of Humanities and Culture Publications, 1983.(A discussion of the relation between form and matter but not in the reasoned language of philosophical theory, rather in the subjective dream life which is shaped by the experience of handling liquids and materials. This leads Bachelard to the concept of the dynamic hand.)

Bachelard, G. (1943) *L'air et les songes: essai sur l'imagination du mouvement*, Paris: José Corti; trans. E. Farrell and F. Farrell, *Air and Dreams: An Essay on the Imagination of Movement*, Dallas, TX: The Dallas Institute of Humanities and Culture Publications, 1988.(Contains a discussion of Shelley's 'Prometheus Unbound' and of the metaphoric link between aspirations to greatness and the idea of taking wing, of soaring into the firmament.)

Bachelard, G. (1948a) *La terre et les rêveries du repos: essai sur les images de l'intimité (Earth and Reveries of Repose: An Essay on Images of Intimacy)*, Paris: José Corti.(In many ways this is a continuation and counterpoint to Bachelard 1942, but here the focus is on the matter which is imagined to underlie all form. This leads Bachelard to the notion of material repose.)

Bachelard, G. (1948b) *La terre et les rêveries de la volonté: essai sur l'imagination des forces (Earth and Reveries of Will: An Essay on the Imagination of Forces)*, Paris: José Corti.(An exploration focusing on the technically creative impulse and its origin in oneiric hypotheses.)

Bachelard, G. (1949) *Le rationalisme appliqué (Applied Rationalism)*, Paris: Presses Universitaires de France. (This work should be read in conjunction with Bachelard 1953. Together they give a sense of the power and originality and fruitfulness of Bachelard's mature philosophy of science.)

Bachelard, G. (1951) *L'activité rationaliste de la physique contemporaine (The Rationalist Activity of Contemporary Physics)*, Paris: Presses Universitaires de France.(An illustration of the concept of 'regional rationalism', first worked out in 1949.)

Bachelard, G. (1953) *Le matérialisme rationnel (Rational Materialism)*, Paris: Presses Universitaires de France. (Together with 1949 this work constitutes a sustained attack on idealism, Husserlian phenomenology and existentialism.)

Bachelard, G. (1957) *La poétique de l'espace*, Paris: Presses Universitaires de France; trans. M. Jolas, *The Poetics of Space*, New York: Orion Press, and Boston, MA: Beacon Press, 1969.(A counterpart to the earlier explorations of space in the scientific context. Follows up the insights of Bachelard 1929.)

Bachelard, G. (1960) *La poétique de la rêverie*, Paris: Press Universitaires de France; trans. D. Russell, *The Poetics of Reverie*, New York: Orion Press, and Boston, MA: Beacon Press, 1971. (Exploration of the reverie - something that played an increasing role in Bachelard's later works.)

Bachelard, G. (1961) *La flamme d'une chandelle*, Paris: Presses Universitaires de France; trans. J. Caldwell, *The Flame of a Candle*, Dallas, TX: The Dallas Institute of Humanities and Culture Publications, 1988.(A discussion of the relations between humans and things, subjects and objects which rests on uncompromising values concerning the nature of those relations that make us more fully human.)

Bacon, Francis (1561-1626)

Along with Descartes, Bacon was the most original and most profound of the intellectual reformers of the sixteenth and seventeenth centuries. He had little respect for the work of his predecessors, which he saw as having been vitiated by a misplaced reverence for authority, and a consequent neglect of experience. Bacon's dream was one of power over nature, based on experiment, embodied in appropriate institutions and used for the amelioration of human life; this could be achieved only if the rational speculations of philosophers were united with the craft-skills employed in the practical arts.

The route to success lay in a new method, one based not on deductive logic or mathematics, but on eliminative induction. This method would draw on data extracted from extensive and elaborately constructed natural histories. Unlike the old induction by simple enumeration of the logic textbooks, it would be able to make use of negative as well as positive instances, allowing conclusions to be established with certainty, and thus enabling a firm and lasting structure of knowledge to be built.

Bacon never completed his project, and even the account of the new method in theNovum Organum (1620) remained unfinished. His writings nevertheless had an immense influence on later seventeenth-century thinkers, above all in stimulating the belief that natural philosophy ought to be founded on a systematic programme of experiment. Perhaps his most enduring legacy, however, has been the modern concept of technology - the union of rational theory and empirical practice - and its application to human welfare.

1 Life

Francis Bacon was born into the political elite of Elizabethan England. His father, Nicholas, was Lord Keeper; his mother, Anne, sister-in-law to Lord Burghley, the Lord Treasurer. Much of Bacon's career and even some aspects of his philosophy can best be understood as resulting from an upbringing which made him familiar with the exercise of power, and the wealth that came with it. His perspective is always that of an insider, but of one who experienced considerable difficulty in establishing his own position as such.

In 1573 Bacon was admitted to Trinity College, Cambridge. In later recollection at least, he found little to admire in the Aristotelian philosophy to which he was introduced, and still less in the writings of such authors as Peter Ramus, who were becoming fashionable alternatives (see Aristotle; Aristotelianism, Renaissance; Ramus, P.). As was usual with undergraduates of his social rank, he did not take a degree. In 1576 he returned to London to train as a barrister at Gray's Inn, an institution with which he was to maintain a much more enduring connection. His father died in 1579, leaving him with only a modest inheritance. Throughout his life Bacon spent freely and lived beyond his income; quite apart from considerable personal ambition, much of his pursuit of office can be seen as an attempt to repair chronic indebtedness.

Though he was elected to successive parliaments from 1581 onwards, Bacon's career did not flourish under Queen Elizabeth, who recognized his abilities but seems to have found his personality unappealing. Burghley was more concerned to advance the career of his own son Robert, later Earl of Salisbury, and Bacon attached himself to Elizabeth's last favourite, the brilliant but insubstantial Earl of Essex. Essex's attempt in 1601 to restore his fortunes by staging an insurrection proved a complete fiasco, and made him liable to prosecution for treason. Bacon adroitly changed sides and prosecuted his former patron with a skill and vigour which provided ample confirmation both of his remarkable talents and of a fundamental coldness of character.

The accession of James I in 1603 presented the prospect - initially unfulfilled - of professional advancement. Bacon was knighted soon after the King's arrival in London, but he had to wait until 1607 before being given his first important office, that of Solicitor General. It was only after the death of Salisbury in 1612 that promotion became truly rapid: in 1613 he was appointed Attorney General, in 1617 Lord Keeper, and in 1618 Lord Chancellor. This last office brought admission to the peerage, first as Baron Verulam (1618) and then as Viscount St Albans (1621).

Bacon's fall was precipitous and catastrophic, though not entirely unpredictable. He had supplemented the income from his office by taking payments from those whose cases he heard, and though this was far from unprecedented it did make him vulnerable to attack. He was also important enough to be a substantial sacrifice to an angry House

of Commons, without being so close to James that he could not be dispensed with. At the beginning of May 1621 Bacon was deprived of office, imprisoned - albeit for only a few days - in the Tower of London, fined £40,000, barred from court and prevented from taking his place in the House of Lords.

Despite his best efforts, Bacon never returned to favour. He spent his last five years in retirement, writing incessantly - at first with the hope of regaining office, or at least influence, and then merely to leave a testament to posterity. He died on Easter Day 1626, according to John Aubrey (who had the story from Hobbes) from a cold contracted after an experiment of stuffing a chicken with snow. As has often been remarked, it was a fitting end for so fervent an advocate of experimental science.

2 Works

During the first two decades of his adult life Bacon wrote little, or at least little that survives; it was however in this period that his outlook and basic ideas were formed - certainly by the early 1590s, and probably earlier still; in 1625 he mentioned to a correspondent that forty years earlier he had advocated the reform of learning in a work (now lost) entitled *Temporis Partus Maximus (The Greatest Birth of Time)*. The direction of Bacon's interests is apparent in a letter of 1592, written to Lord Burghley, in which he (rather disingenuously) disclaimed any political ambition while simultaneously indicating the scope of his intellectual projects:

> I confess that I have as vast contemplative ends, as I have moderate civil ends: for I have taken all knowledge to be my province; and if I could purge it of two sorts of rovers, whereof the one with frivolous disputations, confutations, and verbosities, the other with blind experiments and auricular traditions and impostures, hath committed so many spoils, I hope I should bring in industrious observations, grounded conclusions, and profitable inventions and discoveries; the best state of that province.
>
> (1857-74 VIII: 109)

These themes, developed and articulated, were to preoccupy Bacon for the remainder of his life. No echo of them was however to appear in print for several years. Apart from some political tracts, the only one of Bacon's writings to be published during Elizabeth's reign was the first edition of the *Essays* (1597); the only portion of this volume of any philosophical significance is a short tract on 'The Colours of Good and Evil', which provides early evidence of Bacon's lifelong interest in fallacies and the pathology of the intellect.

The accession of James I stimulated a new burst of literary activity, of which the most visible result was *The Advancement of Learning* (1605), dedicated to the King and evidently written in the (unfulfilled) hope of munificent royal patronage. This was not the only project to have occupied Bacon's attention during the first years of the new reign. A large number of fragmentary treatises have survived, some in English, some in Latin. Several have strange, enigmatic titles: *Temporis Partus Masculus (The Masculine Birth of Time)*, *Valerius Terminus of the Interpretation of Nature with the Annotations of Hermes Stella*, *Filum Labyrinthi (The Thread of the Labyrinth)*. Others are more prosaic: *Redargutio Philosophiarum (The Refutation of Philosophies)*, *Cogitata et Visa de Interpretatione Naturae (Thoughts and Conclusions on the Interpretation of Nature)*. The diversity of the literary form displayed by these works is as striking as their unity of message: Bacon knew at least in outline what he wanted to say, but was undecided as to the most appropriate form in which to say it.

The last of these fragments probably dates from around 1608. For the next twelve years Bacon was increasingly busy with his official duties, and much of the time that remained was spent drafting and redrafting the *Novum Organum*. He did however find time to publish a second expanded edition of the *Essays* (1612) and one new work, *De Sapientia Veterum (On the Wisdom of the Ancients)* (1609), an interpretation of ancient myths as allegories of political and physical doctrine. The same pattern of thought can be found in the unpublished *De Principiis atque Originibus (On Principles and Origins)* (*c*.1610-12?), which also shows the considerable influence of Bernardino Telesio on Bacon's physical doctrines, as do two other works written around 1612, *Descriptio Globi Intellectualis (A Description of the Intellectual Globe)* and *Thema Coeli (Theory of the Heavens)*, both left unfinished and unpublished.

The first instalment of Bacon's chief work, the *Instauratio Magna*, was eventually published with appropriate magnificence in 1620, when Bacon was at the pinnacle of his success. The whole work was to contain six parts, but all that appeared at this stage were a general preface, an outline of the project as a whole (the *Distributio*

Operis), an incomplete section of the second part (the *Novum Organum*), and a short *Parasceve ad Historiam Naturalem et Experimentalem (Preparative towards a Natural and Experimental History)*.

In the years that followed, Bacon went some way towards filling the lacunae in his original plan. The missing first part was supplied in 1623 by *De Dignitate et Augmentis Scientarum*, a revised and greatly extended translation of *The Advancement of Learning*. Despite its evident incompleteness, nothing more was added to the *Novum Organum*; most of Bacon's efforts went into the natural histories intended to fill Part III, which he rather optimistically planned to produce at the rate of one per month. In the event only two were published before his death: on winds (*Historia Ventorum* 1622) and on life and death (*Historia Vitae et Mortis* 1623), although a work on the condensation and rarefaction of materials (*Historia Densi et Rari*) was also completed in 1623. Bacon's executors ignored this - it eventually appeared in 1658 - but did publish the *Sylva Sylvarum* (1627), a natural history in English filled with some very dubious material, which proved very popular during the remainder of the century, but which provided much material for Bacon's nineteenth-century detractors.

The final three parts of *Instauratio Magna* were never written apart from short prefaces to parts four and five (*Works* II: 687-92). The first of these, *Ladder of the Intellect*, was to contain actual examples of the new method in operation - something closer to perfection than the mere sketches provided in the *Novum Organum*. Part V, *Forerunners, or Anticipations of the Second Philosophy*, would, by contrast, exhibit discoveries made independently of the method, by the ordinary workings of the understanding. The content of the final part, the *Second Philosophy or Active Science*, can only be conjectured; one may suspect that Bacon himself had no very precise idea of what it would contain.

Perhaps the best picture of Bacon's final vision can be found in a work of a very different kind, published in the volume containing the *Sylva Sylvarum* but of uncertain date. *The New Atlantis* is an account of an imaginary voyage to an island in the Pacific Ocean, and of the scientific institution, Salomon's House, found there. Like most utopian narratives, this is deeply revealing of its author and provides the fullest picture we have of Bacon's vision of a reformed, active science, and of the kind of institution that he saw as necessary to its flourishing. It also had a profound influence both on the millennialist, visionary Baconianism of the 1640s and on the founders and early practice of the Royal Society.

3 The division of learning

The Advancement of Learning contains two books, the first on the dignity of learning and the reasons for the discredit with which it was often regarded, the second and much longer on the classification of its various branches; in the 1623 translation this latter was expanded further, and divided into eight books.

The primary division of the branches of learning reflects the faculties of the human mind: history corresponds to memory, poetry to imagination, and philosophy to reason. Philosophy itself has three subdivisions: divine philosophy or natural theology, natural philosophy, and human philosophy, this last including the doctrine of the soul, logic, rhetoric, ethics and politics). Metaphysics is a branch of natural philosophy, concerned with formal and final causes, in contrast with physics which studies the material and the efficient. Metaphysics is a more general and more abstract discipline than physics, and rests on it, just as physics in turn rests on a foundation of natural history. The image is that of a pyramid whose vertex is the summary law of nature, known to God but perhaps beyond the bounds of human enquiry.

Rather unusually, Bacon made a distinction between metaphysics and *philosophia prima* - primitive or summary philosophy. The three main subdivisions of philosophy are not like lines meeting at a point, but like branches of a tree that join in a common stem. Arboreal metaphors of this kind may appear to suggest the Cartesian picture of science, in which the trunk of physics grows out of and is sustained by the roots of an a priori metaphysical system, but the reality is quite different. Bacon's *philosophia prima* is a mere receptacle for such miscellaneous principles as have applications in several different disciplines - for example, that the force of an agent is increased by the reaction of a contrary, a rule with applications in both physics and politics.

Bacon's most important innovation was, however, the close linking of theoretical and practical disciplines. In the Aristotelian tradition these had been kept quite separate, but now (within natural philosophy at least) each speculative discipline was to have its operative counterpart: corresponding to physics there would be mechanics; corresponding to metaphysics, natural magic. Bacon had no illusions about the pervasive fraudulence of the

magical tradition, but - as in the parallel case of astrology - he sought reform, not abolition (see Alchemy).

This close association of theory and practice was of the utmost importance: Bacon saw the dismal record of earlier natural philosophy as stemming very largely from their divorce. The practitioners of the applied arts had made what progress they had in a purely empirical way, unaided by any method, while the philosophers - especially, although not exclusively, the schoolmen in the universities - had disdained experience and, like spiders, had spun metaphysical cobwebs out of their own insides. The only hope of progress lay in uniting the two approaches.

4 The new logic

The *Novum Organum* has had far fewer readers than either the *Essays* or *The Advancement of Learning*, partly because of its more difficult subject matter, and partly because it was written in Latin; it is, however, Bacon's most remarkable achievement, and the one which he himself regarded most highly. It cost him considerable trouble - William Rawley, his chaplain, described having seen no fewer than a dozen drafts revised year by year in the decade preceding publication. Bacon's chosen form is the aphorism: initially these are short and highly compressed, but as the work proceeds they grow longer. In the second book, clearly less thoroughly revised, Bacon's grip slackens and then loosens altogether, and the aphoristic form is abandoned except in appearance.

As its title makes plain, the *Novum Organum* was intended as an account of a new logic, designed to replace the Aristotelian syllogistic which Bacon saw as having hampered and indeed corrupted the investigation of nature. The full exposition of this is found in Book II; Book I contains a survey of the task and its difficulties.

The basic themes of the *Novum Organum* are set out in the first three aphorisms:

> Man, being the servant and interpreter of nature, can only do and understand so much… as he has observed in fact or in thought of the order of nature: beyond this he neither knows anything nor can do anything.
>
> Neither the naked hand nor the understanding left to itself can effect much. It is by instruments and helps that the work is done, which are as much wanted for the understanding as for the hand. And as the instruments of the hand either give motion or guide it, so the instruments of the mind supply either suggestions for the understanding or cautions.
>
> Human knowledge and human power meet in one, for where the cause is not known the effect cannot be produced. Nature to be commanded must be obeyed; and that which in contemplation is as the cause is in operation as the rule.

(Bacon 1620: i.1-3)

Natural philosophy needs to begin with observation. Though Bacon sharply separated himself from those whom he classed as 'empirics', his objection to them lay in their lack of method and consequent recourse to unsystematic experimentation, not in their reliance on experience itself. Method is absolutely essential: unmethodical experimentation is mere groping in the dark, and is no more likely to produce results than digging for buried treasure on a purely random basis.

It is an essential feature of the new method that it can be openly described, explained and taught. The new reformed science is seen as an essentially collective activity; though undoubtedly presupposing a certain minimum of intelligence in its operatives, such an enterprise does not require, and is therefore not dependent on, the appearance of individual genius:

> But the course I propose for the discovery of sciences is such as leaves but little to the acuteness and strength of wits, but places all wits and understandings nearly on a level. For as in the drawing of a straight line or perfect circle, much depends on the steadiness and practice of the hand, if it be done by aim of hand only, but with the aid of rule or compass, little or nothing; so it is exactly with my plan.

(Bacon 1620: i.61)

There is therefore nothing intuitionistic about Bacon's approach, nothing at all resembling the Cartesian reliance on clear and distinct ideas. Bacon distrusted any appeal to the supposedly self-evident at the outset of any enquiry. Validation could only be retrospective: it was the ability of a theory to endow its holders with power over nature that provided the best, and indeed the only genuinely satisfactory, evidence for its truth.

Previous attempts at discovery had failed because men had either complacently supposed the mind already to be adequately equipped for the task, or else had despaired altogether. Nature is comprehensible, but its subtlety far exceeds that of the human mind. In order for anything to be achieved, a new logic based not on the *anticipation* but on the *interpretation* of nature needs to be brought into use.

This contrast between anticipation and interpretation is central to Bacon's conception of his project. Anticipations are not hypotheses, but rather 'the voluntary collections that the mind maketh of knowledge; which is every man's reason' ([*c*.1603] 1857-74 III: 244). The root idea is one of superficiality: these are the notions of 'folk physics' - popular ordinary-language concepts such as arise in the ordinary conduct of life, sometimes refined and made more abstract by the labours of philosophers, but not fundamentally altered. 'There is no stronger or truer reason why the philosophy we have is barren of effects than this, that it has caught at the subtlety of common [*vulgarium*] words and notions, and has not attempted to pursue or investigate the subtlety of nature' ([*c*.1607] 1857-74 V: 421).

It was the all-pervasive unsoundness of the concepts used that made the old logic useless as a tool for the investigation of nature. Syllogisms incorporating confused and badly abstracted terms merely propagate error without supplying any means of correcting it; more generally, the teaching of deductive logic encourages the natural tendency of the mind to ascend hurriedly and without due examination to propositions of great generality, and then to regard these as securely established when investigating further. Bacon's method requires not the liberation but the regulation of the intellect, which *'must not… be supplied with wings, but rather hung with weights, to keep it from leaping and flying'* (1620: i.104).

Just as syllogisms are useless for any enquiry into nature, so too is the induction by simple enumeration described in logic textbooks. Bacon consistently regarded this with contempt - 'childish' was his favourite term of abuse. It operated on the surface of things, employing 'popular' notions, and was for that reason incapable of delivering certainty. Bacon was no fallibilist, prepared to settle for a natural philosophy of conjectures and merely provisional conclusions. Certainty was quite as important for him as it would be for Descartes, but what he was looking for was certainty of a very different kind - not immunity from sceptical doubt, but complete reliability. This could be furnished by induction, but it would have to be induction of a new and much more elaborate kind, one that could make use of negative as well as positive instances.

5 The idols of the mind

Before the new logic could be put to use, the weaknesses of the human mind which it was designed to correct or evade needed to be analysed. The central section of Book I is a counterpart to the analyses of sophistical reasoning provided in the logic textbooks. What emerged, however, was not merely a list of inductive fallacies, but rather one of the most memorable and original parts of Bacon's system.

Bacon distinguished four classes of idols. The 'Idols of the Tribe' arise from the limitations of human nature; they can be allowed for and guarded against, but not removed entirely. Bacon had in mind such weaknesses as the tendency to suppose more regularity than actually exists, to be over-influenced by the imagination, and even more by hopes and desires. A very different kind of limitation arises from the dullness of the senses. Bacon had no sympathy with radical sceptical doubts of the kind that were to preoccupy Descartes, but he was acutely aware of the weakness of the human senses, and of their complete incapacity to discern the secret workings of nature. The problem was not one to be abandoned to sceptical despair or solved by metaphysical validation. Some assistance could be gained from the use of instruments, but the real solution lay in experimental design. Hidden processes would be linked with observable consequences, and an experimental determination of the latter would reveal the nature of the former.

The 'Idols of the Cave' arise from the idiosyncrasies of individuals, either natural or implanted by education. Some minds are good at seeing distant resemblances, others at making fine distinctions; some are attracted to ancient wisdom, or what might pass for it, others only to novelty; almost everyone is influenced by those disciplines which they know well, and even more by those to which they have contributed.

The 'Idols of the Forum' (or 'Idols of the Market Place') arise from the deficiencies of human speech. Bacon had no respect for the categories of ordinary language, or the habitual thought-patterns of the uneducated; 'popular' is in his lexicon almost invariably a term of disparagement. Words devised for the ordinary purposes of life cannot

provide a satisfactory vocabulary for natural philosophy, and attempts to remedy the situation by making definitions achieve nothing: words are defined by other words, which themselves share the same defects.

These three classes of idols can be guarded against and to some extent allowed for, but never extirpated entirely. The fourth class is in this respect different. This consists of the 'Idols of the Theatre' - the point of the name was that rival philosophies were like stage-plays, with different casts and different plots, but all equally fictitious. The potential variety of such systems is clearly unlimited, but Bacon distinguished three main types. The natural philosophy of Aristotle and his followers was corrupted partly by logic, and partly by a reliance on common notions - popular conceptions quite unsuited to the task in hand. The empirical school (exemplified by the alchemists, but also including William Gilbert who investigated magnetism) was misled by too narrow a line of experimental enquiry: restricted ranges of data fill the imagination and lead to one-sided accounts of the world in chemical or magnetic terms. Platonism (Bacon had in mind not so much the doctrines of Plato himself - whom he generally treats with respect - as the Platonism of his own era) (see Platonism, Renaissance) was worst affected of all, being corrupted by theology and superstition. Bacon's own religious views are by no means easy to discern and have been very diversely interpreted, but one thing that is abundantly clear is that he was wholly opposed to the intrusion of religious doctrines, Christian or non-Christian, into natural philosophy; the result of allowing this to happen was a corruption of both, into a superstitious philosophy and a heretical religion.

6 Induction

Bacon's methodological proposals occupy Book II of the *Novum Organum*. The first stage in any investigation is the gathering together of a natural and experimental history. This might be quite broad in scope - for example, the history of heat in aphorisms 11-18 - but it could be much more narrowly focused: Bacon's own examples include histories of the rainbow, of honey and of wax. The idea of a natural history was an old one, going back through numerous Renaissance and medieval encyclopedias to Pliny, and ultimately to Aristotle's *Historia Animalium*. Bacon, however, made an innovation of crucial importance. His histories would record not only material gathered from the ordinary workings of nature, but also novel phenomena generated by human activity. In the Aristotelian tradition such artefacts would have been discounted as inappropriate material for investigation; Bacon, however, saw them not merely as legitimate subjects of enquiry, but as especially valuable: 'by the help and ministry of man a new face of bodies, another universe or theatre of things, comes into view' (1857-74 IV: 253). Nature was to be put to the question - a contemporary euphemism for torture.

Histories of this kind could not be assembled quickly, and the whole project would clearly absorb a very large amount of labour and money. Bacon was acutely aware of this, but could see no alternative. The human understanding needed to be purged and cleansed, and this had to be done not by any Platonic (or Cartesian) detachment from the data of the senses, but by an immersion into the world of experience in its full individuality and variety. Bacon was a good nominalist in the English tradition: for him, individuals alone are real and our most reliable cognitions are our direct sensory awareness of them. Withdrawal to a world of abstract objects supposedly accessible to reason leads merely to illusion and the enunciation of empty generalities; for Bacon the word 'abstract' - like 'popular' - almost invariably carries negative connotations.

We have to begin, therefore, with particulars; we have also to begin with as full a range of particulars as possible. Bacon did not require all this data to be correct, though manifestly false material ought to be kept out where possible, and dubious reports marked as such. Some falsehoods were bound to creep in, but these could be dealt with; what could not be dealt with were biases which affected the whole history. Initial attempts to impose criteria of relevance had therefore to be outlawed altogether.

Most histories would contain an immense quantity of data - far too much for any individual human mind to grasp as a whole - and an ordering of this material into some kind of structure was essential. Bacon proposed the use of three tables: first a 'Table of Essence and Presence', listing all the situations in which the nature under investigation is present; then a 'Table of Deviation or Absence in Proximity', describing all those situations which are as close as possible to those in the first table but where the nature under investigation is absent; and finally a 'Table of Degrees or Comparison', a list of those situations where the nature in question varies in intensity, together with details of the circumstances accompanying that variation.

When first drawn up, the second and third tables would both, in general, be incomplete in that they would contain

gaps corresponding to entries in the first. One of the chief functions of experiment was to remedy these defects: for example, given that the rays of the sun can be concentrated by a convex lens, a trial should be made to see whether such lenses can produce heat by focusing the rays of the moon, or any rays proceeding from heated stones or vessels containing boiling water.

When the tables have been drawn up it is possible to begin the inductive process itself:

> The first work therefore of true induction…is the rejection or exclusion of the several natures which are not found in some instance when the given nature is present, or are found in some instance where the given nature is absent, or are found to increase in some instance where the given nature decreases, or to decrease where the given nature increases.
>
> (1620: ii.16)

Only when this process of exclusion has been completed will it be possible to grasp the true essence (or form, to use Bacon's own term) of the nature in question.

This method clearly rests on several presuppositions, of which the most fundamental is a principle of limited variety. Though the world as we experience it appears unendingly varied, all this complexity arises from the combination of a finite, and indeed quite small, number of simple natures. There is an alphabet of nature, which cannot be guessed or discovered by speculation, but which will start to be revealed once the correct investigatory procedures are employed. The time needed is indeed not merely finite but quite short: once the natural histories are complete, the unearthing of all the secrets of nature will require no more than a few years.

Bacon also assumed there to be a direct one-to-one correlation between natures and the forms from which they arise. He was aware that critics might deny this and maintain (for example) that the heat of the heavenly bodies and of fire, or the red in a rose and in a rainbow, are only apparently similar, having quite different causes in reality. Bacon firmly denied this - however apparently heterogeneous, these things agree in the forms or laws which govern heat and redness; indeed even such diverse modes of death as by drowning, by hanging and by stabbing agree in the form or law which governs death.

This way of thinking reinforces a tendency already present in the alchemical tradition of considering bodies as collections of simple natures, each explicable (and therefore reproducible) in isolation. Bacon certainly did think in this way: gold is yellow, heavy, ductile, fixed (that is, unaffected chemically by fire) and so on. Whoever knows the forms of these natures can attempt to join them together in a single body, and thereby transform that body into gold. At other times, however, Bacon seems to have recognized that forms are seldom independent: 'since every body contains in itself many forms of natures united together in a concrete state, the result is that they severally crush, depress, break, and enthrall one another, and thus the individual forms are obscured' (1620: ii.24). They are not, however, hidden altogether: since expansion is part of the form of heat, all heated bodies must expand; but while the expansion of air is easily noticed, that of iron is less manifest to the senses.

The justification of the principles of limited variety and of the direct correlation of forms and natures could always be postponed; another problem, however, had to be faced at the outset. Exclusion involves the rejection of simple natures, 'and if we do not yet possess sound and true notions of simple natures, how can the process of Exclusion be made accurate?' (1620: ii.19). The old logic had proved inadequate because of this deficiency; what grounds are there for supposing that the replacement would fare any better?

Bacon was acutely aware of this problem and of the difficulty it posed for his project. His solution was to propose a series of supports of induction: the account of these occupies the last part of Book II of the *Novum Organum* and is (characteristically) lengthy, elaborate and unfinished; indeed all he managed to describe was the first of his nine kinds of support, the 'Prerogatives of Instances', of which he distinguished no fewer than twenty-seven different varieties. Bacon's account of these exhibits, perhaps more clearly than any other passage in his writings, the distinctive strengths and weaknesses of his mind. The discussion is often shrewd and sometimes much more - the *instantia crucis* has passed into modern science, under the name of a crucial experiment - but Bacon's addiction to elaborate systems of classification and portentous schemes of nomenclature is frequently apparent, above all in the nineteen species of motion described in aphorism 48. The immensity of his intellectual distance from such contemporaries as Galileo is nowhere more apparent than it is here.

7 Natural philosophy

Bacon's intellectual gifts were remarkable, but they were not those of a scientist. He was a lawyer, and it was here, as well as with human affairs in general, that his real area of expertise can be found. He was widely read in natural philosophy, but his approach remained that of an outsider, albeit a shrewd and exceedingly intelligent one. These limitations become particularly apparent when Bacon turned to astronomy, the most highly developed of all contemporary scientific disciplines. He rejected Copernicanism and, although he saw many of the weaknesses of the inherited astronomical tradition, unlike Kepler he had only vague and quite unhelpful ideas about how it might be reformed.

Bacon's own physics was fundamentally non-mechanistic. Bodies contain two types of matter - tangible and spiritual - and the operation of the latter, although never explained clearly, is certainly not conceived in mechanistic terms. Bacon did, however, employ several ideas that were to be taken over by the mechanical philosophers who followed him, in particular that the observable qualities of bodies are to be explained by the constitution of their internal parts. Glass can be made white by being crushed into tiny fragments, and water white by being beaten into foam; heat is not a scholastic real quality but a kind of motion. Later Baconians such as Boyle and Hooke were able to take over these ideas and express them in more unambiguously mechanistic terms.

8 Bacon's influence

Bacon's philosophical writings met with little appreciation in England during the 1620s and 1630s. Admirers of the older learning, from James I downwards, were for the most part uncomprehending, and the one major scientist then practising, William Harvey, was brutally dismissive. Bacon had more impact in France, where he was carefully read by Mersenne, Gassendi and Descartes, but even they only responded to selected parts of the system, notably the 'Idols' and the appeal to experiment.

The political turmoil in Britain in the 1640s stimulated a new interest in Bacon's thought, both among the advocates of universal reform like Samuel Hartlib, and among such natural philosophers as Robert Boyle and Robert Hooke. Baconianism indeed became the official philosophy of the Royal Society, celebrated in Thomas Sprat's semi-official *History* (1667). The hopes thus stimulated, however, proved difficult to satisfy. Newton paid little attention to Bacon, and the *Principia* was an achievement utterly unlike anything projected in the *Novum Organum*. Locke's debt was rather greater, especially in *The Conduct of the Understanding*, but by the early eighteenth century interest in Baconianism had started to decline.

Following the example of Voltaire, the French encyclopedists treated Bacon with great respect as an empirical, essentially secular thinker, to be contrasted favourably with Descartes who was now seen as scientifically discredited and too deferential to the Church. In Britain Bacon was ignored by Hume, but admired by Reid who helped create a widely influential methodological synthesis of Baconian and Newtonian ideas.

The Baconian revival reached its climax in the second quarter of the nineteenth century. Sir John Herschel's *Preliminary Discourse on the Study of Natural Philosophy* (1830) was a thorough attempt to recast Baconianism in a form compatible with contemporary science. John Stuart Mill and William Whewell, though disagreeing about almost everything, both acknowledged a deep debt to Bacon, and to the inductive method of science. The most accessible introduction to early-Victorian attitudes towards Bacon is however provided by Macaulay's essay 'Lord Bacon' (1837). Though respectful towards Bacon's thought, Macaulay took a less favourable view of his character, and it was in response to his account that James Spedding undertook the labours that led to his *Life and Letters* (1857-74: vols VIII-XIV), and to the critical edition of Bacon's works produced jointly with R.L. Ellis and D.D. Heath.

In the latter part of the nineteenth century, Bacon's reputation as a methodologist began to decline. The trend continued after 1900, Bacon's reputation reaching its nadir in the mid-century when Karl Popper proposed a method for science that eschewed induction altogether, and historians such as Alexandre Koyré offered accounts of the scientific revolution that made Bacon's contribution utterly marginal. Since then there has been a modest revival, but Bacon has still not recovered an assured place in the philosophical canon.

List of Works

Bacon, F. (1857-74) *The Works of Francis Bacon*, ed. J. Spedding, R.L. Ellis and D.D. Heath, London: Longmans, 14 vols.(The standard edition, with prefaces that remain of great value. Volumes I-V contain the *Philosophical Works*, VI-VII the *Literary and Professional Works*, and VIII-XIV the *Life and Letters*.)

Bacon, F. (1903) *The Philosophical Works of Francis Bacon*, ed. J. M. Robertson, London: George Routledge & Sons.(A convenient one-volume abridgement of the Ellis and Spedding edition.)

Bacon, F. (1996-) *The Oxford Francis Bacon*, Oxford: Clarendon Press.(Of the twelve planned volumes, volume 6 has appeared - *Philosophical Studies*, *c.1611-1619*, ed. G. Rees. This contains Latin texts and English translations of a group of works on natural philosophy: *Phaenomena Universi*, *De Fluxu et Refluxu Maris*, *Descriptio Globi Intellectualis*, *Thema Coeli* and *De Viis Mortis*.)

Bacon, F. (1597) *Essayes or Counsell, Civill and Morall*, London; repr. Oxford: Clarendon Press, 1985.(Later considerably expanded editions were published in 1612 and 1625.)

Bacon, F. (1605) *The Advancement of Learning*; repr. London: Dent, 1973.(A greatly expanded Latin translation was published in 1623 as *De Dignate et Augmentis Scientarum*.)

Bacon, F. (1609) *De Sapientia Veterum (Wisdom of the Ancients)*, London; Kila, MT: Kessinger Publishing, 1992.(An exposition of ancient myths, taken as allegories of philosophical doctrines.)

Bacon, F. (*c*.1612) *De Principiis atque Originibus (On Principles and Origins)*; repr. in *Philosophical Studies, c.1611-1619*, ed. G. Rees, Oxford: Clarendon Press.(An exposition of Bacon's natural philosophy.)

Bacon, F. (1620) *Novum Organum*; repr. ed. T. Fowler as *Bacon's Novum Organum*, Oxford: Clarendon Press, 1888; trans. P. Urbach and J. Gibson, La Salle, IL: Open Court, 1994.(Bacon's most important philosophical work, containing a detailed though still important account of his work. Fowler reproduces the original Latin text with very useful notes; Urbach and Gibson offer a good modern translation.)

Bacon, F. (1627) *New Atlantis*, London; Kila, MT: Kessinger Publishing, 1992.(Incomplete description of a scientific utopia.)

Bacon, Roger (*c.*1214-92/4)

Associated with both the University of Paris and Oxford University, Roger Bacon was one of the first in the Latin West to lecture and comment on Aristotle's writings on subjects other than logic. After he came to know Robert Grosseteste's work in natural philosophy, he became the advocate of a curricular reform that emphasized scientific experiment and the study of languages. His views were often unpopular, and he constantly belittled all who disagreed with him.

Bacon's work in logic and semantic theory had some influence during his lifetime and immediately after his death. His work in science, however, had little impact. His renown in the history of science is due in part to his being viewed as a precursor of the Oxford Calculators, who in turn anticipated certain important developments in seventeenth-century science.

1 Life

Bacon was born into the minor nobility in Somerset, England. By the time of his death, he had earned the honorific title *Doctor mirabilis* (the Marvellous Doctor) for his prodigious learning in every area of philosophy. He had trained in the Latin classics before attending Oxford University and the University of Paris, and he was Master of Arts at Paris by 1237. At Paris between 1237 and 1247, Bacon wrote his *Sumule dialectices (Brief Summaries of Dialectic)* and *Summa grammatica (Synopsis of Grammar)*, and lectured on Aristotelian works, including the *Metaphysics* and *Physics* as well as the pseudo-Aristotelian *De plantis* and *Liber de causis* (see Liber de causis).

During this period, Bacon became intensely interested in another pseudo-Aristotelian text, *Secretum secretorum (Secret of Secrets)*, which was thought to have been written by Aristotle for his pupil Alexander the Great. In addition to instruction on kingship, the text contained occult lore ranging from astrology and numerology to the magical medicinal properties of plants, and an account of a unified science supposedly transmitted to Aristotle by God through the Hebrews and Egyptians. According to the treatise, this unified science could be recovered only by those intellectually and morally fit for it.

Bacon was so moved by the vision of knowledge revealed in the *Secretum secretorum* that in 1247 he left his teaching position at Paris, moved back to Oxford and spent the next ten years attempting to realize that vision. His efforts were concentrated on language, mathematics and experimentation because he believed that one could decipher Aristotelian texts only if one understood the nature and nuances of the language in which the texts had been written, or into which they had been translated. He also believed that the study of mathematics (including geometry and astronomy), along with experimentation, provided the key to the sciences. His efforts proved to be physically, emotionally and financially draining.

In 1257 Bacon entered the Franciscan order, hoping to find respect for his work and funds for his scientific instruments. Finding neither, he became embittered, and at every opportunity he railed against those of his contemporaries (such as Albert the Great and Thomas Aquinas) who were taking a more traditional approach to philosophical study. By the early 1260s Bacon had become unpopular among the Franciscans, and was apparently sent to their convent in Paris under an injunction to neither lecture nor circulate his writings outside the Order without approval.

Undaunted, Bacon set about communicating his controversial views to Cardinal Guy le Gos de Foulques. The latter, upon becoming Pope Clement IV in 1265, asked to see the writings in which these views were presented in detail. Although Bacon had not yet actually composed these writings, he managed to do so without his Order's knowledge and to have his work delivered to Clement in 1267. The result, the *Opus maius*, was an encyclopedia of the sciences and a proposal for educational reform. It was followed within the year by synopses, additions and corrections in the *Opus minus* and the *Opus tertium*.

Despite Clement's death during the time these additions were being written, Bacon continued for the next ten years to write on his favourite topics. He produced a Greek grammar, a Hebrew grammar and the *Compendium studii philosophiae (Compendium of the Study of Philosophy)* around 1272. The *Communia naturalium (General Principles of Natural Philosophy)* and *Communia mathematica (General Mathematical Principles)*, two surviving sections of a second encyclopedic work begun but never completed, are considered Bacon's most mature work.

Between 1277 and 1279, Bacon's teachings were condemned by the Minister General of the Franciscan Order, Jerome of Ascoli (the future Pope Nicholas IV), and Bacon himself was imprisoned. Why this happened is unclear. Although the official account is that his teachings contained 'suspect novelties' (perhaps some of the propositions condemned in 1277 by Etienne Tempier, the Bishop of Paris), it is possible that his imprisonment came as a response to his refusal to stop verbally abusing everyone whose views he did not share. The targets of this abuse included many of his Franciscan brothers. It is also possible that his imprisonment was the result of the controversial Joachimite views he had embraced (see Joachim of Fiore). Despite these serious problems, Bacon managed before his death some thirteen to fifteen years later to compose at least one more work, *the Compendium studii theologiae (Compendium of the Study of Theology)*, in which his criticisms of contemporary education were extended to cover the moral vices of Christendom as a whole.

2 Views on education

In the mid-1260s, Bacon began to insist that the current educational system needed to be completely revised, and that he himself knew exactly what was required. He shared his contemporaries' belief that God is man's ultimate end but, unlike most of them, believed that the pursuit of science should be instrumental in the study of God (and thus in one's pursuit of moral perfection). By understanding the nature of things, one would come to understand the nature of God who made them. Mathematics also figures in this scheme insofar as Bacon considered geometry to be the key to knowing the efficient and generating causes in nature. He believed that mathematics could be used to verify scriptural claims about creation, such as its chronology and geography.

Bacon was also unusual in believing that the study of texts in natural philosophy should be pursued in conjunction with the study of the languages in which the original texts were written, such as Hebrew, Greek and Arabic. He believed that one could also improve one's understanding of Latin with such study, as many Latin words could not be fully understood without a knowledge of Greek. In general, Bacon believed that all study was subordinate to theology and morality, and that the traditionally valued subjects of study such as metaphysics should be ranked below experimental science, mathematics and languages in the hierarchy of academic study. The ecclesiastical authorities in charge of education, he urged, ought to take account of these facts and revise the curriculum accordingly.

These ideas are expressed in detail in the *Opus maius*, along with a general account of why people are in their present predicament with respect to knowledge. Because of sin and humanity's fallen state, truth is difficult for us to discover. We cannot trust reason to provide us with demonstrative proof of anything; but we can use reason to help us formulate hypotheses which can then be confirmed by sense-perception, understood either as ordinary experience or as experience aided by instruments. Reason, according to Bacon, is part of an inner experience which is provided when God illuminates our mind (his debt to Augustine is evident in this view). However, sin affects our ability to reason in four specific ways. First, we submit to untrustworthy authority; that is, we mistakenly believe sources other than God (in the form of Scripture) or the Church Fathers (who were reliable interpreters of Scripture). Second, we are unduly influenced by long-standing custom, believing that what is traditional must therefore be right. Thus, we give more weight than we should to popular opinion. Fourth, we try to conceal our ignorance with a technical show of wisdom. In this connection Bacon condemned the current practice in the universities of using Peter Lombard's *Sentences* rather than the Bible as a basis for lecturing in theology.

That Bacon was altogether serious about the importance of educational reform is evident not only in his strident disapproval of great men of his day who did not embody the ideals he deemed appropriate - men such as Alexander of Hales, Bonaventure, Albert the Great and Thomas Aquinas - but also in his dedication to the study of optics, the making of experimental instruments and a firm understanding of languages (although he seemed to rely mostly on Latin translations of the treatises he used in his research).

3 Work in science

As already noted, Bacon emphasized the practical objectives of studying both philosophy in general and natural philosophy, or science, in particular. It was his view that science had to do with natural laws that could be expressed or elucidated mathematically, and that true science therefore had nothing to do with magic, which he characterized as a false mathematics based on superstition and the presumption that everything is causally necessitated. His view of mathematics as the key to the sciences seems to have had two sources. First, he accepted

Grosseteste's view that everything in the terrestrial and celestial realms is a manifestation of light, the diffusion of which takes place in accordance with laws of geometry (see Grosseteste, R.). Second, he believed that mathematical knowledge is certain knowledge insofar as all the other Aristotelian categories depend on a knowledge of quantity, the subject matter of mathematics, and insofar as things known to us and things in nature are absolutely the same only from a mathematical point of view. Given these reasons, it is not surprising that Bacon gave optics (*perspectiva*, or the theory of vision) pride of place among the sciences. He stood apart from his contemporaries in that instead of simply giving an account of optics, he tried to show how it fit into the whole of knowledge and to synthesize what was known about optics up to that time in the work of writers such as Euclid, Ptolemy and Alhazen.

Bacon also differed from his contemporaries in insisting that science, or a complete account of nature, must include an experimental as well as a theoretical component; without experience, he says, nothing can be known sufficiently. Aristotle's claim that 'a demonstration is a syllogism that makes us know' is to be understood not of the bare demonstration but of the case in which experience of the subject matter accompanies the demonstration. According to Bacon, by means of experiments one could (a) confirm hypotheses formulated on the basis of reason, (b) gain knowledge of that which is inaccessible to proof by deductive arguments, and (c) develop products to aid in everyday life. Examples of such experiments as carried out by Bacon include research into rainbows, the properties of magnets and gunpowder. In the traditional approach to education taken by Bacon's contemporaries, however, this aspect of knowledge was usually not even acknowledged, much less advocated.

Bacon himself did not make the kind of progress in empirical science that might have been expected, given the enthusiasm with which he advocated it, and given the accounts of his scientific prowess made popular during the seventeenth century, after his work had been rediscovered. He did make some advances; for example, he provided models for plane surfaces and for convex refracting surfaces, thereby advancing understanding of the nature of vision and the usefulness of lenses in aiding vision. On the whole, however, he appears not to have been a good scientist or mathematician. He produced no mathematical proofs or theorems, he held alchemy in high regard and he believed that by reading the stars one could come to know about the future. Because he had no disciples, his work was quickly forgotten after his death.

4 Linguistic work

As noted, Bacon's plan for curricular reform included a plea for the study of languages, which he represented as the vehicle of knowledge. He himself took the study of language seriously. Not only did he write grammars for both Greek and Hebrew, but he also devoted part of Part III of the *Opus maius* (called *De signis (On Signs)*) and part of the *Compendium studii theologiae* to discussions of signification in language, and wrote an analysis of the nature of ambiguity in his *Sumule dialectices*.

Bacon's comprehensive approach to the study of natural philosophy was replicated in his study of language. His interest in language was part of a wider interest in the nature of all signs, vocal and otherwise. 'Man', for instance, is a sign of an actually existing universal instantiated in all individual men, and smoke is a sign of fire. This approach was not typical in Bacon's day (see Language, medieval theories of).

Bacon's views on how words functions as signs were also unusual, and were developed in opposition to the views of people such as William of Sherwood, Lambert of Auxerre, Siger of Brabant and Boethius of Dacia. For example, it was Bacon's view that all words are equivocal. The basis of this view was his belief that (a) words signify conventionally (*ad placitum*) as a result of meaning being imposed on them, either expressly or tacitly, by an individual or group of individuals, and that (b) any semantic theory must explain how words can signify not only present but also past and future individuals as well as never-existent things. Bacon believed that he could provide such a theory if it were presupposed that first, each act of imposition makes a word signify exactly one thing (where 'thing' is broadly construed as a word or a non-word, particular or universal, existing or imaginary), and second, each imposition lasts only as long as does the signified thing. Thus, if the word 'man' is imposed by someone to signify an individual man, it would acquire another sense in addition to its standard sense (signifying the common nature or universal humanity). In this case, the word 'man' has two senses and is thus equivocal. When the man signified by 'man' in virtue of the special imposition dies, 'man' would not signify him any longer, although one could impose a third meaning on the word 'man' to use it as a sign of the physical remains of what once was a man. There is no determinable limit to the various senses that can be imposed on a word, either

consciously or unconsciously. With such a theory of signification, Bacon thought he could solve many of the linguistic puzzles of the day. For example, could Jesus be called a man during his three-day entombment? Can man be said to be an animal when no man exists? Is the sophisma-sentence 'This is a dead man, therefore this is a man' true? His questions, his grand schemes, his idiosyncratic pursuits, even his animosities and his mistakes, show him to have been very much ahead of his time.

Bakhtin, Mikhail Mikhailovich (1895-1975)

Bakhtin is generally regarded as the most influential twentieth-century Russian literary theorist. His writings on literature, language, ethics, authorship, carnival, time and the theory of culture have shaped thinking in criticism and the social sciences. His name is identified with the concept of dialogue, which he applied to language and numerous other aspects of culture and the psyche.

Bakhtin viewed literary genres as implicit worldviews, concrete renditions of a sense of experience. Strongly objecting to the idea that novelists simply weave narratives around received philosophical ideas, he argued that very often significant discoveries are made first by writers and are then 'transcribed', often with considerable loss, into abstract philosophy. For example, he regarded the novelists of the eighteenth century as explorers of a modern concept of historicity long before philosophers took up the topic. He argued that considerable wisdom could be achieved by probing the form, as well as the explicit content, of literary works. In literature as in life, however, much wisdom is never fully formalizable, although we may approximate some of it and gesture towards more. Such partial recuperation was, in Bakhtin's view, the principal task of literary criticism.

Bakhtin's favourite genre was the realist novel. In his view, novels contain the richest sense of language, psychology, temporality and ethics in Western thought. He revolutionized the study of novels by arguing that traditional poetics, which employed categories suitable to poetry and to drama, had been unable to appreciate just what is novelistic and especially valuable about novels. Seeking the essence of 'prosaic intelligence', he therefore formulated an alternative to poetics, which critics have called 'prosaics'. This term also designates an important part of his worldview in approaching many other topics, especially language. Bakhtin stressed the prosaic, ordinary, unsystematic, events of the world as primary. In culture, order can never be presumed, but is always a 'task', the result of work that is never completed and always upset by everyday contingent events. Better than any other form of thought, great prose, especially realistic novels, captures this prosaic sense of life.

Believing in contingency and human freedom, Bakhtin described individual people, and cultural entities generally, as 'unfinalizable'. Human beings always manifest 'surprisingness' and can never be reduced to a fully comprehensible system. Paraphrasing the implications of Dostoevskii's novels, Bakhtin located humanness in the capacity of people 'to render untrue *any externalizing and finalizing definition of them. As long as a person is alive he lives by the fact that he is not yet finalized, that he has not uttered his ultimate word' ([1929] 1984: 59; original emphasis). Ethically, the worst act is to treat people as if some 'secondhand' truth about them were exhaustible. Psychologically,*

> *A man never coincides with himself. One cannot apply to him the formula of identity $A \equiv A$... the genuine life of the personality takes place at the point of non-coincidence between a man and himself... beyond the limits of all that he is as a material being ... that can be spied upon, defined, predicted apart from its own will, 'at second hand.'*
>
> *([1929] 1984: 59)*

Bakhtin therefore opposed all deterministic philosophies and all cultural theories that understate the messiness of things and the openness of time. He rigorously opposed Marxism and semiotics, although, strangely enough, in the West his work has been appropriated by both schools. Stating his own thought as a paraphrase of Dostoevskii, he wrote:

> *nothing conclusive has yet taken place in the world, the ultimate word of the world and about the world has not yet been spoken, the world is open and free, everything is still in the future and will always be in the future.*
>
> *([1929] 1984: 166)*

1 Life

The son of a bank manager, Bakhtin studied classics and philology at the University of Petrograd (1913-18). His meticulous knowledge of obscure ancient writers is reflected throughout his work. Most of his subsequent life can be seen as a series of escapes into obscurity. During the Russian Civil War, he moved to the small towns of Nevel and Vitebsk, where he worked as a schoolteacher, discussed philosophy and acquired his two best-known

disciples, Valentin Voloshinov and Pavel Medvedev. Interested in Neo-Kantianism, Bakhtin worked on a comprehensive treatise about ethics, authorship and the relation of the self to others (see Neo-Kantianism). In the 1920s, he also encountered the most influential non-Marxist school of criticism, Russian Formalism, learned from their ideas, and rejected their fundamental approach, which he saw as scientistic in its pursuit of laws at the expense of contingency and individual agency (see Russian literary Formalism). Their reduction of content to form ran counter to his view that literature and language are repositories of wisdom acquired by human experience over ‘great time’. In 1924, he moved to Leningrad, where he failed to find stable employment, perhaps because of a bone disease eventually leading to the amputation of his right leg in 1938. In 1929, he published his book on Dostoevskii, which was recognized as a classic.

Nevertheless, his bourgeois background, his interest in religion and his non-Marxist approach made him suspect in the Soviet Union, and in 1929 he was arrested. A sentence that would have meant his death in a harsh labour camp was commuted to six years of internal exile in Kazakhstan. During the 1930s he worked at odd jobs, including bookkeeper on a collective farm. During these years he wrote his classic essays on language and the novel. Out of step with the times, these essays were not published until 1975. He also worked on a study of Rabelais and the institution of carnival, which he described in terms of systematic parody by inversion of social norms. The Rabelais thesis was submitted for a doctorate, but only a lesser degree was awarded, and the book did not appear in print until 1965. Later, it became the first of his works to be widely known in the West.

In 1936 he became a professor at the remote Mordovia State Teachers College, but soon resigned so as to remain less visible during the years of mass arrests. He returned to his professorship at the end of the Second World War. During the 1950s, intellectuals in Moscow were again inspired by Bakhtin’s book on Dostoevskii and were surprised to discover that the author (unlike Voloshinov, Medvedev and so many others) had not perished during the years of purges and privation. Celebrated, sometimes worshipped as a secular saint, he inspired reminiscences of dubious accuracy. He continued to write essays on general problems of culture from the perspective of dialogue.

For a time, the rumour circulated that Bakhtin had written some of Voloshinov’s and Medvedev’s works, and publishers reissued their books under his name. But the weight of argument and evidence indicates that Bakhtin influenced but did not write these books.

2 Language as dialogic

In his book on Dostoevskii, in ‘Slovo v romane’ (Discourse in the Novel) (1934-5), in ‘Problemy rechevykh zhanrov’ (Problems of Speech Genres) (1952-3) and elsewhere, Bakhtin offers an alternative to the linguistic theories of Saussure and movements indebted to him, including formalism, structuralism and semiotics (see Semiotics; Structuralism in linguistics). His critique, and that of Voloshinov in *Marksizm i filosofiia iazyka (Marxism and the Philosophy of Language)* (1929), would also apply to the Chomskyite tradition (see Chomsky, N.).

For Bakhtin, the fundamental unit of language is not the sentence but the utterance. Whereas sentences are repeatable, utterances occur in a specific situation. Still more important, they are formulated as part of a dialogic exchange. Utterances are not only responded to, but are shaped in anticipation of a response. In a sense, they belong to both speaker and listener. Bakhtin finds simplistic the telegraphic model of communication, in which response (or decoding) simply follows the utterance; the same reasoning would apply to what literary critics think of as reader reception theory.

Bakhtin uses his key term ‘dialogue’ in three distinct senses: as a worldview or sense of truth, as a particular use of language and as a defining quality of language itself. When taken as a defining quality of language, the term indicates that all utterances are dialogic: they are constituted by their ‘addressivity’. Dialogic relations are (from the standpoint of Saussurean linguistics) metalinguistic. Metalinguistic relations are not reducible to logical or linguistic ones. Two sentences may contradict each other, but when they are ‘embodied’ (spoken by particular people on a particular occasion), new kinds of relations are established. Thus, if two people say, one after another, ‘Life is good’, from the standpoint of linguistics we have a repetition of the same sentence, from the standpoint of logic we have the relation of identity, but from a dialogic perspective, we have agreement. But agreement is never full, and the second utterance, necessarily embodied by a different person, carries with it a different experience that leads to different implications, which we all keenly sense. Tone, an ‘emotional-volitional’ stance, is crucial to

its meaning, and tone does not appear in the sentence but in the utterance. Indeed, some utterances (hm!) are spoken entirely as carriers of tone, something like verbal gestures. A mapping of dialogic relations (Bakhtin offers an incomplete typology) would necessarily involve complex relations outside the purview of either linguistics or logic. In life, we understand these relations, and if the study of language is to comprehend how language is used, it must describe them.

This approach differs from one focusing on the abstract system of language, which is in any case not as systematic as linguists suppose. Linguists typically avoid the issues on which Bakhtin focuses by 'smuggling' into a sentence features properly belonging to an utterance when convenient.

If one views utterances dialogically, other features not present in sentences come into view. For example, everything we speak about is 'already spoken about' and our utterances orient themselves dialogically not only to potential listeners but also to earlier utterances on the topic. No one is the 'biblical Adam' uttering the first word on a topic, and complexities of meaning, which are reflected in style, arise from the diversity of orientations to previous utterances. Traditional stylistics, which views choice of words simply as the expression of the author, misses the shaping role of both listener and previous speakers. Bakhtin compares 'the word' (utterance) to a ray of light entering a tension-filled, social 'atmosphere filled with alien words, value judgments and accents through which the ray passes on its way to the object' (1934-5: 277).

Thus, some elements of reported speech are present in every utterance. Bakhtin (and Voloshinov) offer detailed analyses of the various forms of reported speech in part because all speech is, obviously or surreptitiously, reported. The obvious forms of reported speech vary from culture to culture, depending on attitudes towards discourse, authority and the relation of self to other. The concept of the 'already-spoken-about' illustrates what Bakhtin means by saying that in calling language dialogic he is referring not only to 'compositionally expressed dialogue', as in play scripts, but also to 'the internal dialogism' of each utterance.

3 Heteroglossia

Because order is always a 'task', Bakhtin argues that 'a unitary language is not something given but is always in essence posited' (1934-5: 270). Language, like the rest of culture, is constantly subject to 'centrifugal' forces disrupting it in unsystematic ways; cultures often respond with 'centripetal' efforts to restore a minimum of unity by writing dictionaries and grammars. What we call *the* English language is in part the effect of nonlinguistic social pressures.

But other ways of speaking exist, and these cannot be adequately understood by referring to dialects. Instead, Bakhtin calls attention to the fact that groups speak differently because they conceive of experience differently. Each profession, generation, locale, ethnic group or any of countless other shifting identities, all have their own characteristic vocabularies, ways of addressing others, styles and intonations because they think and understand the world in their own way. Language is always languages; it manifests 'heteroglossia'. There is no single formal principle for identifying each of these 'languages' because what distinguishes them is conceptualizations of experience, which may be expressed in countless ways, each of which is 'the sclerotic deposit' of specific social activity.

All of us in fact know more than one language of heteroglossia because we function in diverse environments. We often approach one field of experience in one language and with the attitudes of another, and so languages of heteroglossia may enter into dialogue. This process not only changes our sense of experience but also, when repeated by many people, affects the development of language. Bakhtin preferred such messy and unsystematic accounts of language change to notions like those of the Formalists, who saw language as an abstract system developing by principles that were themselves abstract and systematic, so that, as Roman Jakobson and Iurii Tynianov observed, the history of a system is itself a system.

4 Double-voicing

All utterances are dialogic in one sense, but not in another. For utterances have different 'tasks'. Although all utterances can be shown to be cited or reported from other contexts, sometimes we do not want such allusiveness to be perceived; we just want to get our point across. At other times, for example when we engage in parody,

perception of ‘quotation marks’ is necessary to our purposes. Thus, some utterances are monologic, others dialogic; some ‘single-voiced’ and others ‘double-voiced’. In double-voiced utterances we have two speech acts and are meant to perceive both sets of intentions.

Double-voiced utterances may in turn be divided into passive and active. The distinction lies in the relation of the two utterances to each other. The utterance cited or alluded to may be subservient (passive) to the first. In parody, for example, the target utterance clearly enjoys lower semantic authority than the parodying utterance. The two disagree, and we know with whom we are expected to side. In another form of passive double-voiced word, stylization, we distinctly hear two utterances - say, one from another era and style and one currently spoken - that remain in qualified agreement. (One must not forget that agreement is also a dialogic relation.)

Sometimes the second utterance actively resists appropriation by the first. ‘In such discourse, the author’s thought no longer oppressively dominates the other’s thought, discourse loses its composure and confidence, becomes agitated, internally undecided and two-faced’ ([1929] 1984: 198). Sometimes, speech seems to take a ‘sideward glance’ at a possible hostile answer and responds to it in advance; the word has a ‘double orientation’, towards its topic and towards an expected response so active that it may utterly dominate the utterance. This sort of speech is rather common in everyday life, where it appears in various barbed words, overblown discourse repudiating itself in advance or the speech of deeply agitated people. It is especially well represented in literature. Dostoevskii’s *Zapiski iz podpol’ia (Notes From Underground)* contains actively double-voiced ‘words with a loophole’, in which speakers retain the right to reverse their position if they get the wrong response. One may sense a loophole in a tone of potential (but not definitive) self-mockery or in agitated exaggeration.

5 Psychology and ethics

Throughout his life, Bakhtin battled against what he initially called ‘theoretism’ and (after studying language) named ‘monologism’: the idea that the world is fundamentally orderly and that experience is in principle fully capturable in abstract theories. What theories that reason down to experience, instead of up from it, usually produce is bloodless ‘transcriptions’ of events. For example, the heritage of rationalism views events as utterly explicable in terms of underlying laws. Any such approach necessarily reads out of events their ‘eventness’, that which makes them and the present moment ‘momentous’ in the face of multiple future possibilities. When applied to language, theoretism leads to the Saussurean division between *langue*, the abstract system of language, and *parole*, the particular speech act, viewed as a mere instantiation of rules. Applied to people, it makes them entirely ‘coincident’ with themselves, a mere bundle or system of qualities without ‘unfinalizability’.

When ethics proceeds in this way, it grossly oversimplifies situations by fitting them into pregiven categories, whereas the most ethically relevant facts may turn out to be entirely unpredictable in advance. In stressing the importance of particulars, Bakhtin revives casuistry’s reasoning by cases (see Casuistry; Moral particularism). Also, the essence of ethical choice, its ‘oughtness’, depends on the ‘eventness’ of the event, which is lost in top-down reasoning. Morality involves taking into account a particular person, not a generalized agent, in a specific, unrepeatable situation: ‘What can be accomplished by me cannot be accomplished by anyone else, ever’ ([*c*. early 1920s] 1986: 129). For Bakhtin, the highest value is a human being, and the subordinated value is ‘the good’, and not the other way around. In the Soviet context, Bakhtin understandably opposed the sort of ideological thinking that displaces responsibility to an abstract authority or set of rules, which we are obliged to follow mechanically (the state of mind he calls ‘pretendership’). Rules and many other psychological mechanisms offer us an illegitimate ‘alibi’ whereas the essence of ethical life is our perpetual state of ‘non-alibi’. (This position is loosely comparable to existentialist analyses of authenticity and ‘bad faith’: see Existentialist ethics §3.)

Bakhtin’s early writings situate ethics within a larger discussion of the phenomenology of self. We see other people as they cannot see themselves. You cannot see the back of your head or the expression of your face when it is unselfconscious; your tears are framed for me by the blue sky behind and your own act of looking cannot appear in your field of vision. That is, I enjoy a ‘surplus of vision’ with respect to you; people exist in a state of ‘outsideness’ with respect to each other. For me you are part of the world, whereas your ‘I-for-myself’ experiences itself as entering into the world. Thus, we never see ourselves in our dreams as a finished presence, as we see others; but when we narrate our dreams later, we make ourselves into a character. In that case, the I-for-myself enters into the world by narrating.

Our selves consist in part of the ‘finalized’, almost artistically rendered images of ourselves that we receive from others. Bakhtin calls this sense of self received from others the ‘soul’, which is a ‘gift’ from outside. For the I-for-myself, the soul is something that we are always transcending, rendering partly untrue; the self is always ‘yet-to-be’. Ethically, outsideness and the surplus indicate that empathy, in the sense of merging, is the wrong way to respond to another’s suffering. For if merging were successful, no help could be given. Instead, what is needed is ‘living into’ another in which we put ourselves in the other’s position while also retaining our ‘surplus’, an outside position from which something new and helpful can be offered.

Bakhtin’s theories of language led him to the idea that, once a person acquires language, consciousness and selfhood are primarily linguistic in nature, so long as one understands language dialogically. We learn language by internalizing dialogic exchanges, and when we think we enact dialogues (often highly abbreviated) in our heads. Significant people in our lives become the repeated addressees of our inner speech; in effect, we are the voices that inhabit us. Thus, the full range of dialogic phenomena that appear in Bakhtin’s theories of language can be reinterpreted psychologically; Bakhtin also adds some new types of internal dialogic relations. In opposition to Freud, who viewed the self as something that must be socialized, Bakhtin saw the self as essentially social because it is dialogic.

6 Authorship and polyphony

Bakhtin’s early works contend that characters in a literary work cannot be truly free. After all, the author knows in advance their ultimate destiny and the significance of everything they do. Because they are part of a larger whole, they are themselves given ‘whole’, with no room for genuine surprisingness. Readers are always aware that the author is in full control, has planned everything in advance, and so no event is truly ‘eventful’. It would appear that narrative art excludes the possibility of representing anything but a pale image of human freedom.

In Bakhtin’s view, Dostoevskii discovered how to overcome the tendency of art to impose a destiny on characters. What they say and do is surprising to the author and truly eventful. Critics have plausibly discerned in the idea of polyphony a theological agenda, which could not be expressed directly in the Soviet Union. If we allow that the relation of God to people is analogous to that of an author to heroes, then if a polyphonic author could create characters capable of genuine surprise, God may have created people polyphonically as well. He may have deliberately created the world as a genuinely open process, where he cannot foresee what happens because human freedom genuinely exists.

To create the polyphonic novel, Dostoevskii surrendered an author’s ‘essential surplus’ with respect to his characters. This ‘essential surplus’ (which is stronger than the ordinary surplus each person enjoys with respect to others) consists in having a plan of the whole. Our knowledge that the author enjoys this surplus means that in a literary work the author must be the ‘ultimate semantic authority’: the meaning of any character’s utterances cannot be taken directly but must be mediated through the work as a whole. But in Dostoevskii’s novels, each major character enjoys semantic authority equivalent to the author’s. The author (not just the narrator) becomes simply another character. The result is that characters may surprise the author and the work becomes an open-ended, unfinalizable dialogue among distinct points of view.

To create such a work, Dostoevskii does not predetermine a plot, but, through a complicated process, concretely imagines fully realized voices, each expressing a whole sense of existence. He then creates a situation that will provoke the characters into dialogic confrontation; he records, in turn, what each one says, without knowing in advance where the conversation is leading. If a given character or narrator expresses Dostoevskii’s own opinions, that voice is just another in the dialogue, and, indeed, may lose the argument or wind up saying things the author has not imagined he could say. The results of each exchange are then allowed to lead to another, and the overall novel is simply the succession of thrilling dialogues. Plot is whatever happens to occur and ceases to be essential; it is no longer the ‘clamps’ holding the work together. The essence of the work lies in its ‘great dialogues’.

In addition to freedom, surprisingness and eventness, polyphony’s very form expresses another key idea: ‘monologism’, ‘theoretism’ and ‘rationalism’ are mistaken in recognizing only one kind of truth. Monologism’s truth is composed of abstract propositions that ‘gravitate’ to a system (an ‘ideology’), in which the particular voice speaking each proposition does not affect its truth value. But truth may also be dialogic, that is, may require many voices:

> It is quite possible to imagine and postulate a unified truth that requires a plurality of consciousnesses, one that in principle cannot be fitted within the bounds of a single consciousness, one that is, so to speak, by its very nature *full of event potential* [eventness] and is born of a contact among various consciousnesses.
>
> ([1929] 1984: 81)

Any attempt to 'transcribe' or 'monologize' this truth into a proposition will inevitably reduce it to a shadow of itself.

7 Theories of the novel

As we have seen, genres, like languages of heteroglossia, each express a view of experience. Because, according to Bakhtin, novels offer the richest view of life, his elucidation of their hidden wisdom in effect states his own views.

Bakhtin offers three distinct accounts of this genre's 'form-shaping idea'. The first follows from his theory of language. Keenly aware of the vast diversity of social beliefs implicitly carried by each 'language of heteroglossia', novels orchestrate an intense dialogue of those languages. Social values come into unexpected interaction as we see the 'image' of one language from the perspective of another. Novels may exaggerate actually existing dialogues of languages or create new dialogues among languages that have still not encountered each other in real life. The result is to deprive a given language and way of thinking of its naïveté: it can no longer present itself as the unchallenged best way to talk about its central topics. It is now 'contested, contestable, and contesting'. No longer able to regard itself as the unchallenged centre of things, a language ceases to move in a 'Ptolemaic' universe. The novel expresses a 'Galilean language consciousness'.

Poetics and stylistics, which rely on an examination of tropes, miss this essential activity of novels. They look for a style, whereas the novel manifests a peculiar style of styles, an 'interillumination of languages', each approaching others from various angles. Languages hybridize. Bakhtin offers a catalogue of how languages 'reaccentuate' each other. Because novels intensify hybridization always around us in daily life, they become a subtle sociological form. And because our inner speech also consists of such dialogues, novels are revealing about our mental processes in a way otherwise unavailable.

It is important to recognize that when Bakhtin speaks of such dialogues, he is not talking about the exchanges between characters. He has in mind the complex play of languages in the voice of narrators. The novel is distinguished from other genres precisely by its intense orchestration of voices and languages in this way. For example, a given character's particular way of speaking, which reflects a complex of social attitudes, infiltrates the narrator's speech and so may be felt even when the character is not present; the narrator's language is affected by this 'character zone'. Or the 'common language' of some group may be ironically reaccentuated in the narrator's speech, which weaves in and out of various languages. Bakhtin offers a number of examples as he develops a theoretical framework.

Bakhtin's second theory of the novel focuses on its temporality. He offers a catalogue and a history of literary genres, from antiquity to the nineteenth century, each of which embodies implicit assumptions about causality, agency, biography, the social environment's effect on action, a sense of historicity, fate or freedom and countless other topics concerned with our status as actors in a spatiotemporal, socio-historical world. These assumptions are rarely made explicit, but they may be detected in the characteristic ways a plot is constructed in each genre. For example, action that is plausible in one genre (last-minute escapes in an adventure story) may be completely implausible in another. Bakhtin calls a specific way of conceptualizing human action in time and space a 'chronotope'.

For Bakhtin, Goethe was the key figure in establishing the chronotope of the modern novel, and so he joins Rabelais and Dostoevskii as Bakhtin's favourite authors. The novel displays the most sophisticated chronotope for several reasons. It displays a sense of open time: 'Reality as we have it in the novel is only one of many possible realities… it bears within itself other possibilities'. Novels are also 'heterochronous': they display a social world in which many different chronotopes operate and interact. Novels understand how people change. Whereas in picaresque, the order of incidents could be changed because the hero or heroine remains essentially the same, novels show a gradual process of 'becoming'. Moreover, character change is not conceived as a mere 'unfolding' or revealing of inherent qualities, but as a complex process of interaction among social forces,

individual initiative and contingent events. Whereas in romances and other genres, the social world is mere background that does not significantly affect the characters, in novels the social world itself partially shapes their development. That is one reason why it has proven easy to transpose romances across centuries or national boundaries, whereas novelistic action is typically located precisely in time and place and would be almost impossible to relocate elsewhere. The novel recognizes both social constraints and individual choice and subtly shows their interaction. Moreover, social forces are themselves seen as in flux - a process of change that is often the key theme of novels. Above all, novels show their main characters as possessing what Bakhtin calls a ‘surplus of humanness’. In contrast to Soviet Marxism and other ideologies describing people as, in principle, fully knowable, the novel understands a person as transcending any conceivable ‘secondhand’ definitions: ‘There is no mere form that would be able to incarnate once and forever all of his human possibilities and needs, no form in which he could exhaust himself down to the last word’. For the novelistic hero ‘there always remains a need for the future, and a place for this future must be found’.

Deeply suspicious of Soviet and all other ‘theoretist’ dogmatisms, Bakhtin appropriated the novel as a counter-weapon. This appropriation is most evident in his third theory of the novel as a ‘carnivalized’ genre, that is, as a form embodying the spirit of various social rituals (especially the ancient Saturnalia and medieval carnival) that subject all received social norms to parody. Whereas theorists conventionally traced the novel to ancient epic, Bakhtin stressed its debt to menippean satire, a literary form beginning in antiquity that mixed philosophy and various kinds of parody in a highly idiosyncratic form. In the Renaissance, Rabelais combined menippean satire with the spirit of carnival to produce a distinctive amalgam leading, by way of Laurence Sterne and others, to the realist novel with its deep suspicion of all dogmatisms. Bakhtin recognized that it is possible to write long prose narratives without this menippean spirit, without the novelistic chronotope and without ‘dialogized heteroglossia’, but such works (which would include socialist realist fiction) are merely ‘unnovelistic novels’. Where ‘prosaic intelligence’, ‘unfinalizability’ and the spirit of open-ended dialogue join, as they do in the novel, we reach the most profound human vision - yet.

GARY SAUL MORSON

List of works

Bakhtin, H.M. (written 1919) ‘Iskusstvo i otvetstvennost’’, trans. V. Liapunov, ‘Art and Answerability’, in *Art and Answerability: Early Philosophical Essays by M.M. Bakhtin*, Austin, TX: University of Texas Press, 1990, 1-3.(Bakhtin’s first published work, a short essay on ethics and literature.)

Bakhtin, H.M. (written c. early 1920s) *K filosofii iskusstva (Towards a Philosophy of the Act)*, in *Filosofiia i sotsiologiia nauki i tekhniki 1984-5*, Moscow: Nauka, 1986, 80-160; Austin, TX: University of Texas Press, 1993.(This early work is Bakhtin’s key statement on ethics.)

Bakhtin, H.M. (written c.1920-3) ‘Author and Hero in Aesthetic Activity’, in M. Holoquist and V. Liapunov (eds) *Art and Answerability*, Austin, TX: University of Texas Press, 1990. (A meditation on the relation of selves to others, in life and literature.)

Bakhtin, H.M. (1924) ‘The Problem of Content, Material, and Form in Verbal Art’ in M. Holoquist and V. Liapunov (eds), *Art and Answerability*, Austin, TX: University of Texas Press, 1990.(Bakhtin’s critique of Russian Formalism.)

Bakhtin, H.M. (1929) *Problemy poetiki Dostoevskogo*; expanded 2nd edn 1963; ed. and trans. C. Emerson, *Problems of Dostoevsky’s Poetics*, Minneapolis, MN: University of Minnesota Press, 1984.(This is a translation of the expanded 1963 edition. Perhaps his single most important work, it discusses genres, ethics, the novel and the theory of language with Dostoevskii as constant illustration.)

Bakhtin, H.M. (written 1934-5) ‘Slovo v romane’, trans. C. Emerson and M. Holquist, ‘Discourse in the Novel’, in *The Dialogic Imagination*, Austin, TX: University of Texas Press, 1981, 259-422.(His theory of language and defence of a specifically prosaic approach to prose.)

Bakhtin, H.M. (written 1936-8) *Roman vospitaniia i ego znachenie v istorii realizma*, trans. V. McGee, ‘The Bildungsroman and its Significance in the History of Realism’, in *Speech Genres and Other Late Essays*, Austin, TX: University of Texas Press, 1986, 10-59.(These are surviving fragments from Bakhtin’s lost book on Goethe and the novel of education.)

Bakhtin, H.M. (written 1937-8) ‘Formy vremeni i khronotopa v romane’, trans. C. Emerson and M. Holoquist, ‘Forms of Time and of the Chronotope in the Novel’, in *The Dialogic Imagination*, Austin, TX: University of Texas Press, 1981, 84-258.(The key statement of his philosophy of time. Concluding remarks written 1973.)

Bakhtin, H.M. (written 1940) ‘Iz predystorii romannogo slova’, trans. C. Emerson and M. Holoquist, ‘From the

Prehistory of Novelistic Discourse', in *The Dialogic Imagination*, Austin, TX: University of Texas Press, 1981, 41-83.(Like 'Discourse in the Novel' this discusses the theory of novelistic prose.)

Bakhtin, H.M. (written 1941a) 'Epic and Novel', in *The Dialogic Imagination*, Austin, TX: University of Texas Press, 1981, 3-40.(A synthesis of Bakhtin's various theories on the novel.)

Bakhtin, H.M. (written 1941b) *Tvorchestvo Fransua Rable i narodnaia kul'tura*, trans. H. Iswolsky, *Rabelais and His World*, Cambridge, MA: MIT Press, 1968.(This thesis, unsuccessfully submitted for a doctorate, was not published in Russia until 1965.)

Bakhtin, H.M. (written 1952-3) 'Problemy rechevykh zhanrov', trans. V.W. McGee, 'The Problem of Speech Genres', in *Speech Genres and Other Late Essays*, Austin, TX: University of Texas Press, 1986, 60-102.(The importance of genres of daily speech in understanding dialogue.)

Bakhtin, H.M. (1970) 'Otvet na vopros redaktsii Novogo mira', trans. V.W. McGee, 'Reply to a Question from the Novy mir Editorial Staff', in *Speech Genres and Other Late Essays*, Austin, TX: University of Texas Press, 1986, 1-9.(A key statement on the theory of interpretation of texts from remote times and cultures.)

Bakhtin, H.M. (1970-1) 'Iz zapisei 1970-1', trans. V.W. McGee, 'From Notes Made in 1970-71', in *Speech Genres and Other Late Essays*, Austin, TX: University of Texas Press, 1986, 132-58.(A series of jottings on various topics.)

Bakhtin, H.M. (1975a) 'K metodologii gumanitarnykh nauk', trans. V.W. McGee, 'Toward a Methodology for the Human Sciences', in *Speech Genres and Other Late Essays*, Austin, TX: University of Texas Press, 1986, 159-72.(Stresses a dialogic approach.)

Bakhtin, H.M. (1975b) *Voprosy literatury i ėstetiki: Issledovaniia raznykh let (Questions of Literature and Aesthetics: Research of Various Years)*, Moscow: Khudozhestvennaia Literatura.(Inlcudes the first publication of some important articles.)

Bakhtin, H.M. (1979) *Ėstetika slovesnogo tvorchestva (The Aesthetics of Verbal Art)*, ed. S. Bocharov, Moscow: Iskusstvo.(Collection containing several key texts.)

Bakhtin, H.M. (1986) *Literaturno-kriticheskie stat'i (Literary-critical Articles)*, ed. S. Bocharov and V. Kozhinov, Moscow: Khudozhestvennaia literatura.(A comprehensive anthology.)

Bakunin, Mikhail Aleksandrovich (1814-76)

Bakunin was the leading proponent in the second half of the nineteenth century of a variety of anarchism rooted in a Romantic cult of primitive spontaneity, and one of the principal ideologists of Russian populism. But along with his public defence of the principle of 'absolute liberty' he attempted to set up networks of secret societies which were to direct the revolution and subsequently assume dictatorial powers. The contradiction between these two aspects of his activities has puzzled historians, many of whom have sought the answer in his personality, in which the urge to dominate was as strong as the urge to rebel.

1 Life

Born into a gentry family in the Russian province of Tver, Mikhail Aleksandrovich Bakunin became a leading figure in the Moscow intellectual circles of the 1830s as an exponent first of the idealism of Fichte, and subsequently of a conservative interpretation of Hegel. In Germany, where he went to study philosophy in 1840, he was converted to radicalism in philosophy and politics by the Young Hegelians (see Hegelianism; Hegelianism, Russian). In France he met Proudhon, who would have an important influence on his later thought. During the upheavals of 1848-9 he preached a revolutionary Pan-Slavism, calling for a democratic federation of all Slavic nations (see Pan-Slavism §3). Arrested in 1849 for revolutionary activities in Dresden, he was handed over first to the Austrian and then to the Russian government, which condemned him to prison followed by exile in Siberia. In 1861 he escaped to London, to collaborate with Aleksandr Herzen's émigré press (see Herzen, A.I.) on revolutionary propaganda directed at the Russian Empire. After the suppression of the Polish uprising of 1863 he turned his revolutionary hopes to Western Europe and began to expound an anarchist philosophy (see Anarchism). He founded his own international organization, the Alliance of Socialist Democracy, which he sought to have affiliated to the First International. He disbanded it as a tactical measure when his request was rejected, and joined the International with his supporters in order to challenge its domination by Marx's faction, which the Bakuninists accused of dictatorial centralism. Expelled from the International in 1872, he devoted his last years to revolutionary projects (including a rising in Lyon during the Franco-Prussian War) which all ended in failure.

2 Thought

Like many of his generation in Russia, Bakunin found in German Idealism a source of compensating fantasies which helped him sublimate his sense of alienation and achieve a foretaste of the wholeness which he craved. He was particularly attracted to Fichte's vision of absolute liberty as an earthly ideal to be attained through a protean feat of will (see Fichte, J.G. §5). Fantasies of self-affirmation alternated in the young Bakunin's thought with dreams of self-surrender through communion with the Absolute in religious or aesthetic contemplation, or through idealized platonic relationships with others of his circle (the cult of the 'beautiful soul').

Bakunin believed that his arrival in Europe had transformed him from a dreamer into a man of action; but his often-expressed contempt for 'theorizers' was based on the Romantic theory of the regenerative power of primitive spontaneity. He interpreted the unrest among the peoples of the Russian and Austro-Hungarian empires in the 1840s as the expression of elemental forces which were destined to sweep away all the artificial systems and institutions that sought to suppress them. This spirit of instinctive revolt, 'the sole creative force in history', was to be found at its purest in the most primitive, and thereby the least corrupt, of the common people: the peasantry. He placed high hopes on the Russian peasants who had a tradition of revolt, and whom he represents in his *Vozzvanie k Slavianam (Appeal to the Slavs)* of 1846 as a 'fiery ocean' which will engulf Moscow in blood and flame, and bury all the slavery in Europe beneath its own ruins. This faith was based on his version of the revolutionary dialectic of the Left Hegelians. In 'Die Reaktion in Deutschland' (Reaction in Germany) (printed in Arnold Ruge's *Deutsche Jahrbücher* in 1842 under the pseudonym 'Jules Elysard') he proclaims that the total destruction of the 'positive' (the existing order) by the forces of 'negation' will lead to 'a new heaven and a new earth… in which all the discords of our time will be resolved in harmonious unity'. This essay, which gave him his entrée into radical circles in Europe, ended with the famous line: *'Die Lust der Zerstörung ist auch eine schaffende Lust!'* ('The urge for destruction is also a creative urge!')

The anarchism which became his creed in the 1860s was a logical consequence of his cult of spontaneity. He now declared all states to be oppressive by their nature as institutionalizations of the rule of systems over life. The

infallible instincts of the masses were the only source of freedom and virtue. These instincts had created the peasant commune which still survived in Russia: a form of self-government which could become universal once the masses were freed from the tutelage of political and intellectual elites who could teach them nothing and who sought to prolong the tyranny of theory over life: as a prime offender in this respect he pointed to the scientific socialism of Marx, although Marx’s economic materialism was an important influence on his thought, along with Comtian positivism and Feuerbach’s critique of religion (see Comte, A.; Feuerbach, L.A.).

He considered himself a materialist, atheist and positivist, but the theoretical basis of his anarchism was flimsy and shot through with contradictions. In particular, his two principal theoretical works, *L’Empire Knouto-Germanique et la révolution sociale (The Knouto-Germanic Empire and the Social Revolution)* (1871) and *Gosudarstvennost’ i anarkhiia (Statism and Anarchy)* (1873) belie his self-image as the champion of ‘life’ against scientific and metaphysical abstraction. In these works he argues that all contemporary conflicts can be traced to the opposition between ’two polarities’: the state (equated with reaction), and revolution (identified with his brand of anarchism). He defines the primary characteristic of the masses as their spirit of rebellion: this forces him to exclude from the category of the ‘true’ people all those not inclined to rebel. Those who were so inclined are much idealized in Bakunin’s anarchist writings, along with the revolutionary secret societies for which he tirelessly recruited, but which existed more in his imagination than in fact.

His conspiratorial writings expound the notion of an ’invisible dictatorship’ which, by ensuring the unhindered expression of the people’s will, would bring about ’absolute liberty’, a state of being that Bakunin interprets collectivistically. He reverts to the mystical exaltation of his early idealism in passages in which he invites the revolutionary intellectual to ’drown’ in the purifying stream of popular revolt, thereby exchanging the ’appearance’ of power for its reality. His plans for dictatorship have been seen as attempts to act out idealist fantasies of spiritual self-fulfilment; they had disastrous consequences in his association with the notorious Jacobin Sergei Nechaev, whose *Catechism of a Revolutionary* justified all methods that furthered the cause of revolution, and who illustrated this theory in a murder that inspired Dostoevskii’s *Besy (The Possessed)*. Bakunin idealized Nechaev’s violent personality and methods as the embodiment of a purifying force of destruction, and in 1869-70 collaborated with him on the production of pamphlets designed to foment a peasant rising in Russia. Bakunin’s attempt to justify Nechaev’s crime to his fellow revolutionaries was a shameful episode in his career, exemplifying his reluctance to confront the contradiction between his goal of anarchist liberty and the authoritarian means to which, in his millenarian impatience, he was prepared to resort.

Bar Hayya, Abraham (*c*.1016-*c*.1136)

Abraham bar Hayya (also called bar Hiyya) sought to reconcile Jewish tradition with contemporary philosophical thought, in his case that received from Arabic sources. Generally considered to be a Neoplatonist whose philosophy is enriched with Aristotelian accretions, he has also been called the first Jewish Aristotelian. He pioneered the writing of philosophy in Hebrew, and his work influenced later Jewish philosophers and the Kabbalah.

1 Life and works

Little is known of bar Hayya's life. Even the familiar form of his name, bar Hiyya, appears to be mistaken; there is clear evidence, including a rhyme in which he uses his name, that his patronymic was bar Hayya. He is known to have lived in Barcelona, but there is evidence that he visited France, probably Provence. He held high office, probably judicial, in the Jewish community and apparently also in the general community.

A polymath, bar Hayya wrote on astronomy and astrology, mathematics, geography, optics and music as well as philosophy. Some of his works, translated into Latin, became important sources in medieval European science. He himself was a translator from Arabic to Latin, collaborating on a number of scientific translations with the Christian scholar Plato of Tivoli, who transmitted the Ptolemaic system to the Latin world.

Bar Hayya's philosophy is found in two works, *Hegyon ha-Nefesh ha-Azuvah (The Meditation of the Sad Soul)*, an ethical work based largely on homiletical expositions of biblical texts, and *Megillat ha-Megalleh (The Scroll of the Revealer)*, written to fix an eschatological timetable according to which the Messiah will appear after 1136 and the dead will be resurrected in 1448, but also incorporating philosophical sections.

2 Metaphysics

Unlike many other medieval Jewish philosophers, bar Hayya omits proofs for God's existence and attributes, which he regards as self-evident. The structure of the universe clearly shows the unity of God and reveals him as its creator. Creation *ex nihilo* is assumed. The forms of all things and the archetypes of all species were first created in potentiality during the six days of creation, after which God brought them into actuality to endure throughout time. In potentiality things consist of form, matter and non-being. To bring them to actuality, God removed non-being and joined form to matter. Form and matter, the basic constituents of all that is, exist separately in God's pure thought, until conjoined by the divine will. Both are subdivided: matter into pure matter and sediment; form into closed and open forms. Creation results from the emanation of a light from the closed form (which itself is too pure to combine with matter and is identified with the light created on the first day in the biblical account) (see Creation and conservation, religious doctrine of). The upper world above the firmament (that is, the heavens) is divided into five worlds of light, the highest of which corresponds to the divine throne. The light emanating from within the closed form shines on the open form, enabling it to combine with matter. From this results the creation of the firmament and the four elements of which the world is composed. The human soul is a form temporarily attached to matter but ultimately destined to return to pure form. Expressed in traditional Jewish terms, the light can exist in this world and the world to come; the firmament and luminaries, in this world but not the next; and the lower creatures, in neither. Human beings are distinguished from other animals by their rational faculty, and those who act appropriately have their real existence in the next world, not this one.

3 Humility and eschatology

Humanity, the summit of creation, has three souls: vegetative, animal and rational (see Soul, nature and immortality of the). The goal of human life is to subdue the lower two souls to the rule of the rational. If the rational soul rules, one is righteous; if the others dominate, one is wicked. At death, one retains only the rational soul, and its state determines one's subsequent fate. The highest reward goes to the saint, aloof from affairs of the world, whose whole life is devoted to the hereafter, in fear and worship of God. Such an individual separates himself from this world and is not moved by its desires or lusts. The ascetic ideal bar Hayya expresses here is rare in Jewish contexts, but it is found in his contemporary Bahya Ibn Pakuda. The guiding virtue for bar Hayya is humility, and he despises worldly possessions; but only one in a thousand is perfect and merits the full rewards of the world to come, the world of pure form, in which the saint is completely emancipated from matter. Those who

have sinned have the freedom, while still alive, to repent, and the reward of sincere repentance is eternal bliss. The suffering of the righteous serves to test them in this world, so as to enhance their reward in the world to come. Evil, like good, emanates from God. It comes to the world not only to test the righteous but also to requite the wicked (see Evil, problem of). Free will ends with death; there is no subsequent repentance, and the actions of descendants cannot affect the fate of the dead (see Free will).

Things acquired in this world have no permanence. The righteous live in this world only to establish merits that will sustain them in the next. We gain life in the world to come through belief in God and his Torah and by acting only for the sake of God. The wicked have no future after death; their disembodied souls mingle, leaving none distinguishable from its fellow. Obliteration is the fate of all non-Jews; for, even if they repent, it is not for God's sake. The world to come is unalloyed bliss, 'life without death, being without non-being'.

Just as man is superior to other animals, so Israel is superior to the other nations. However, this superiority is not exclusive; it is open to all who are willing to accept the Torah. In the messianic era, all evil will end and enmity will be abolished. All the wicked and most of the nations on earth will perish. Only Israel and true proselytes to the Torah will survive. All the sufferings of Israel will be requited at the time of salvation by punishments exacted upon the other nations of the world. Salvation will be followed by the resurrection of the dead, but only of Israel, the souls of the righteous reunited with their bodies.

4 Significance

Bar Hayya is usually classed within the Neoplatonic tradition because of his emanationism and his doctrine of light (see Neoplatonism). However, his ideas of form and matter, potentiality and actuality show the impact of Aristotelian thinking. He imbibes ideas from both traditions. Stitskin (1960) classed him firmly as an Aristotelian, a pioneer of Jewish Aristotelianism and of the reconciliation of biblical with Peripatetic thought, but bar Hayya was well acquainted with the various schools of Greek thought known in his time in Arabic adaptations and abridgments, and he sometimes also reflects Arab mystical thought and the ideas of the Ikhwan al-Safa' (see Ikhwan al-Safa'). He was also familiar with Christian thought. His sources were eclectic, and his emphases often motivated by Jewish concerns. He cannot be tied exclusively to a single system.

Like other Jewish philosophers, bar Hayya sought to reconcile Jewish tradition with the rationalism of his day. All his philosophical work has a biblical or rabbinic basis, and it often uses exegetical methodology to link his philosophical reflections to scriptural tradition. Indeed two of the four chapters of the *Hegyon ha-Nefesh* take the form of homilies on the prophetic portions (Isaiah 57: 14-58: 14 and Jonah) read in the synagogue on the morning and afternoon of the Day of Atonement. His treatments of sin, repentance, and eschatology follow rabbinic tradition.

Along with his contemporary fellow-townsman Judah ben Barzillai, bar Hayya was the first Jewish philosopher to write in Hebrew, and as a result he had to coin many of the terms he used (Efros 1926-7). His predecessors had written in Arabic (in Hebrew letters) for an audience of Jews in Islamic countries. Bar Hayya's use of Hebrew in philosophic and scientific works indicates that he was writing for other Jews as well, perhaps in southern France. For them, philosophical thought would have been a novelty, and bar Hayya is at pains to stress that his ideas could be inferred from biblical sources. The influence of his writings can be traced in later Jewish philosophical thinkers, as well as in Kabbalistic thought, including the Book of Bahir and the German pietists.

Barth, Karl (1886-1968)

Karl Barth was the most prominent Protestant theologian of a generation shaken by the traumatic experience of the First World War and concerned with giving Christian theology a new grounding. He took a creative part in the struggle of the German Church against National Socialism, and, after the Second World War, exerted a worldwide influence that reached beyond the bounds of Protestantism. Although influenced at first by Christian socialism, Barth came to repudiate such 'hyphenated' versions of Christianity, which, he felt, underemphasize or ignore the otherness of God. There is an infinite qualitative distinction between the divine and the human; the Enlightenment attempt to historicize and secularize revelation was profoundly mistaken. This 'dialectical theology' attracted a number of leading theologians in the 1920s. Later, however, Barth felt compelled to close the gap with the divine, and developed a 'theology of the Word' to this end. Central to this approach is the concept of the knowledge conferred by faith, which makes theological understanding and rationality possible. It was on the basis of this that Barth constructed his massive Die Kirchliche Dogmatik (Church Dogmatics) (1932-70). In this, he emphasizes the self-expounding nature of Scripture (by contrast with nineteenth-century biblical scholarship, which stressed the need for a historical approach to the text) and the importance of Christ in the understanding of theology and human nature. He was a determined opponent of natural theology, and was critical of the idea that philosophy could complement theology.

1 Life

Karl Barth, a German-speaking Swiss theologian, was born in Basle, the son of Fritz Barth and Anna Sartorius. In 1889, his father, a minister and theologian of the liberal school, succeeded Adolf Schlatter at Bern University. Hence Barth was raised in Bern, where he attended the Free Gymnasium. Under his father's influence he read theology at the local divinity school. He completed his theological education in Germany, in Berlin, Tübingen and Marburg. In Berlin, he attended the lectures of the prominent liberal Church historian Adolf von Harnack. In Marburg, he fell under the influence of the Christocentric dogmatician Wilhelm Herrmann, Albrecht Ritschl's most prominent disciple. Barth's career began as assistant pastor in Geneva in 1909 and culminated as professor of theology at Basle University. Meanwhile he had played a crucial role in the German Church's struggle against National Socialism and had become, in Eberhard Jüngel's words, 'the most significant Protestant theologian since Schleiermacher'.

Barth served as a pastor in Safenwil in Aargau from 1911 to 1921. In 1913, he married Nelly Hoffmann, with whom he had five children. A liberal theologian by training, Barth was faced at Safenwil with the predicament of the working class for the first time in his life. To help the workers in his congregation he began to study law. He frequented the 'religious socialists', led by Hermann Kutter and Leonard Ragaz. In December 1911, he delivered a speech to Safenwil's Workers' Union, 'Jesus Christus und der soziale Bewegung' ('Jesus Christ and the Movement for Social Justice'), which identified Christianity with socialism. Barth claimed that 'Jesus is the social movement and that the social movement is Jesus today'. The start of the First World War broke the spell. His confidence in Culture-Protestantism was shattered. Liberal theologians had failed to prevent a resurgence of barbarism, in spite of their repeated emphasis on the religious, moral and social commitments of the Christian. The open support given by leading German theologians to the Kaiser shocked him deeply.

In September 1919, Barth delivered an epochal lecture, 'Der Christ in der Gesellschaft' ('The Christian in Society'), at a religious socialist conference in Thuringia. Won over to Christoph Blumhardt's millenarian eschatology, Barth deprecated altogether Adolf Stöcker's Christian-social movement, Friedrich Naumann's Protestant-social era, and Ragaz's religious-social programme. All these ventures, charged Barth, result in a 'hyphenated Christianity' that merges religion with socialism at the expense of revelation and the Beyond. Instead, he demanded that the otherworldliness of God be truly respected. Barth's speech marked a return to the theological paradigms of sixteenth- and seventeenth-century Protestantism. The same year, Barth published *Der Römerbrief* (*The Epistle to the Romans*), which heralded a new era in Protestant theology. A revised edition appeared in 1922 and an English translation in 1935. Emil Brunner, a Swiss colleague, praised Barth's commentary as the first victory over the platitudes of nineteenth-century Protestantism, while a dismayed Harnack saw it as part of the sickness of the age.

Barth's *The Epistle to the Romans*, which signalled the end of modernity for Protestantism, established his reputation, and he was called to the chair of Reformed theology at Göttingen in 1922. It also gave rise to the 'theology of crisis' school, the movement baptized by Bultmann as 'dialectical theology'. Eduard Thurneysen, Friedrich Gogarten, Emil Brunner (§1) and Rudolf Bultmann (§2) were among the school's most outstanding advocates. In 1923, the dialectical theologians started the journal *Between the Times*, under the editorship of George Merz, which lasted until the school's disruption in 1933. By the time of Hitler's accession to power, however, the dialectical theologians had gone separate ways. In 1925, Barth assumed the chair of systematic theology at Münster. He moved to the University of Bonn in 1930 and was dismissed in 1935 for refusing to take the oath of allegiance to Hitler. Meanwhile, he had taken part in the struggle against the German Christian movement. The 'Barmen Confession' (1934a), a rallying statement by a collection of evangelical ministers and teachers, was based on preparatory work by Barth. This confessional document spoke against the German Christians' nationalist, racist and anti-Semitic teachings, and affirmed Jesus Christ to be the one Word of God. It gave rise to the Confessing Church.

Barth returned to Switzerland to take a chair of systematic theology in Basel, a position he held until he retired at the age of 75. From there he continued his opposition to the Nazi regime, publishing polemical articles in *Between the Times* and in *Evangelical Theology*, as well as numerous pamphlets. He also pursued the writing of his major work, *Die Kirchliche Dogmatik* (*Church Dogmatics*), which he had begun in 1932. Through the years the work grew to thirteen volumes of over nine thousand pages. The *Church Dogmatics* is more than a systematic theology; it abounds with exegetical, historical, theological, practical and philosophical ideas, and is widely regarded as a classic.

During the Second World War, Barth championed the cause of the Allies. However, he was among the first to plead for reconciliation with defeated Germany. He went back to Bonn in the academic year 1946-7 and lectured at his former university. During the East-West conflict, he refused on moral grounds to view communism as on a level with National Socialism. He delivered the opening address at the first meeting of the World Council of Churches in Amsterdam in 1948, and lectured in many European countries and the USA. In 1966, he visited Rome at the invitation of Pope Paul VI and upon his return published *Ad limina apostolorum* (1967).

2 Dialectical theology

The 'theology of crisis' differs from the theological systems of neo-Protestantism (eighteenth- and nineteenth-century Protestantism) in its task and its method. What Barth proclaims in his *The Epistle to the Romans* is the otherness of God. Contrary to liberal theology, God is neither the sum of subjectivity and objectivity, nor a result of personal experience in either consciousness or history, but the Lord (*Gott der Herr*), the wholly other (*totaliter aliter*). Postulating the identity of God (*Gott ist Gott*) - a tautological axiom - Barth further predicates, under Kierkegaard's influence, an infinite qualitative distinction between time and eternity (see Kierkegaard, S.A. §§4-5). He postulates a radical separation between the divine and the human, and understands the relationship between transcendence and immanence as one of absolute apartness. In restoring the sixteenth-century Reformers' supernaturalism, he overturned the nineteenth-century account of the connection between revelation and history and repudiated the cultural objectives of later Protestantism. Barth accused the Enlightenment of having given rise to a way of thinking that psychologized, historicized, moralized and secularized revelation, the eternal and the Beyond. He thus rejected any form of relation between theology and philosophy, the former being the proclamation of God's sovereign grace. Barth put an end to the post-Kantian synthesis of neo-Protestantism, substituting a principle of separation for one of unity, causality and identity.

But if God is uncompromisingly transcendent, how can human beings speak about God? Wilhelm Herrmann's answer was that this is possible because God has revealed himself - we can speak of God because of the Incarnation. The way to God originates from God. Since for Barth human beings are finite, lacking the capacity for the infinite, all human ways are bound to end in failure. Thus faith is a crisis and grace a pure miracle. Barth thus stressed two of the Reformation's fundamental doctrines: the imputed justification by faith and the absent God. Justification comes from beyond us. The resurrection reveals the One who lives in the inaccessible light, the incognito of God.

Concerning the method of theology, Barth discarded the idea of a 'scientific' theology, much valued by the liberals, and instead proposed a theologizing process which starts from the object itself, the Beyond. He inverted

the traditional noetic process, which, since Descartes, had proceeded from the thinking subject. On the contrary, claimed Barth, the human knowledge of God originates from God's knowledge. This is a Hegelian legacy. Barth propounded the dialectical method in 1922 in 'Das Wort Gottes als Aufgabe der Theologie' (The Word of God as the Task of Theology). The divine Word is the source of theological knowledge, the foundation of Christian dogmatics and the guiding principle of every theological doctrine. What the dialectical method stresses is the paradoxical nature of the revelation. Barth later realized that the dialectical method hindered theological production and devised a new method.

3 Theology of the Word

The introduction of the Trinity in Barth's structuring of theology in 1924 marked a transition from 'dialectical theology' to the 'theology of the Word'. To bridge the divide between the divine and the human was essential to Barth. Besides Hegel, he followed Peter Lombard and Bonaventure (§4). In 1927 he published a dogmatics (*Die christliche Dogmatik in Entwurf (Christian Dogmatics in Outline)*), and in 1931 a study of Anselm (*Fides quaerens intellectum (Faith Seeking Understanding)*) in which he defended a fiducial interpretation of the ontological argument (see Anselm of Canterbury §§3-4). The Anselmian proof presupposes the fiducial knowledge of the God whose existence it claims to prove rationally. Understanding presupposes belief. The discovery of Anselm made possible what the dialectical method had rendered impossible. Owing to the centrality of the knowledge of faith in the noetic process, understanding and rationality - both indispensable in order to write a dogmatics - were possible. Fiducial knowledge is proper to theology; it becomes rational knowledge through analysis of the content of revelation, which communicates God's Word. And, again following Hegel (§4), revelation is a self-revelation. Faith and rationality are united in the understanding of faith. Fiducial knowledge is intrinsically rational because its essence, the Word of God, is rational.

From this perspective, Barth undertook the construction of the *Church Dogmatics*, a systematic theology which can best be characterized as biblical, Christocentric and ecclesiastical. The Scripture is the authoritative witness to God's revelation in Jesus Christ. It is the written Word, which points to the Word revealed and grounds the Word preached. The meaning of Scripture can only be obtained by allowing Scripture to be its own interpreter. This idea stems from the sixteenth-century Reformers. Calvin's doctrine of Scripture emphasizes two main ideas: clarity and sacred Scripture as its own interpreter. Like Calvin (§2), Barth asserts the self-expounding clarity of Scripture. Any prior understanding of God, a philosophical presupposition or anything else, is thus excluded from Barth's hermeneutics. God's self-revelation in Jesus Christ can only be known and confessed as it is attested and expounded by the direct witnesses. Against nineteenth-century biblical scholarship, Barth denied the ability of the historical-critical method to go behind the text. Hearing God's Word comprises three stages: explanation, reflection and appropriation.

Jesus Christ is the ground, content and object of Christian religion. Christian doctrines must therefore be interpreted in the light of the Incarnation. Barth acknowledged the Chalcedonian doctrine of two natures and asserted that the person of Jesus Christ is the union of true deity and true humanity (see Incarnation and Christology §1). The cross and the resurrection clear the way for human justification and sanctification. God's self-revelation, Jesus Christ, is at the same time the true human being. Jesus Christ discloses for us the essential truth about human nature; he is the source of knowledge for anthropology as well as for theology. Barth's Christocentric interpretation of the Bible involved a return to the traditional relationship between creation and redemption, as well as to the Lutheran dialectic of Law and Gospel. As creation must be seen in the light of redemption, so the Law must be understood in the light of the Gospel.

Barth's dogmatics is a systematic theology written within the Church for the Church. The ministry of the Church is threefold: it consists of the declaration, explication and application of God's Gospel. Such ministry may take the form of speech or action. Although salvation primarily concerns human existence, it is essentially eschatological. Hence the Church anticipates the *eschaton*, the fulfilment of redemption.

4 Philosophy

The relationship of Barthian theology to philosophy is ambiguous. Barth made ample use of philosophical structures and concepts, while at the same time claiming the independence of theology from philosophy. He ruled out any possible alliance, even one that would result in philosophy being construed as the handmaid of theology.

Barth discarded any philosophical preconditions for faith. The tautological axiom ('God is God') and the Christocentric principle preclude any knowledge of God from other sources. In Barth's thought, unlike Calvin's, there is no room for a general revelation of God, be it in human consciousness, in nature or in history. Thus he declared war against natural theology, a stance exemplified in the notorious dispute with Emil Brunner (§§2, 4) (Barth 1934b). For Barth, natural theology was closely associated with Roman Catholicism and particularly with the Thomist doctrine of the analogy of being. He objected on three major grounds: first, the thinking process starts from below, from finite human understanding; second, it sunders God's essence, which is naturally knowable, from God's action, which is known supernaturally by means of revelation; third, it jeopardizes the exclusiveness of God's revelation in Jesus Christ. Instead, Barth proposed an analogy of faith, or of relation. A faith relationship to God is the prerequisite for any discourse about God. And any true faith relationship exclusively depends on God's self-revelation in Jesus Christ. Furthermore, God's relationship to humanity depends on God's self-relationship, on the interrelatedness of the Trinity as revealer, revelation and revealed (*Offenbarer*, *Offenbarung* and *Offenbarsein*).

In 'Philosophie und Theologie' (1960), Barth appraises the possibility of philosophy and theology coexisting. He observes that philosophers may choose their starting-points whereas theologians are bound to start with the Incarnation. Starting from below, philosophizing is an ascending process. It moves upwards from the phenomenon to the idea, from reason to being. By contrast, theologizing is a retracing of God's condescending movement. Therefore the philosopher and the theologian are separated by a matter of order and priority. They may share a common objective, but their methods are incompatible.

Barthes, Roland (1915-80)

In the field of contemporary literary studies, the French essayist and cultural critic Roland Barthes cannot be easily classified. His early work on language and culture was strongly influenced by the intellectual currents of existentialism and Marxism that were dominant in French intellectual life in the mid-twentieth century. Gradually his work turned more to semiology (a general theory of signs), which had a close association with the structuralist tradition in literary criticism. In his later work, Barthes wrote more as a post-structuralist than as a structuralist in an attempt to define the nature and authority of a text. Throughout his writings Barthes rejected the 'naturalist' view of language, which takes the sign as a representation of reality. He maintained that language is a dynamic activity that dramatically affects literary and cultural practices.

1 Early writings

Roland Barthes was born in Cherbourg, France and studied French literature and Classics at the University of Paris. After a long illness that caused him to spend time in sanatoria during the war years, he taught French at the Universities of Bucharest and Alexandria, and began further studies in sociology. In 1947 he published a number of articles in *Combat* on literary criticism that formed the basis of his first book, *Le Degré zéro de l'écriture* (1953) (*Writing Degree Zero*, 1968). In 1960 he began teaching at the École Pratique des Hautes Études, and in 1976 he became Professor of Literary Semiology at the Collège de France. Barthes died after being struck by a van outside the Collège de France.

In *Writing Degree Zero* Barthes formulated a theory of writing on the basis of an account of language as a 'social object' and a 'field of action' in which the writer communicates. This account has much in common with the existentialist writer Jean-Paul Sartre, who, like Barthes, sought to break free of the orthodox view of literature as a-historical and considered it ideological in its unquestioned acceptance of the bourgeois universe. Against this view the writer is to be a liberator. Unlike Sartre, however, Barthes came to the conclusion that the writer can do little directly to effect social change and that the writer does not write exclusively for the sake of society. The writer also writes for the sake of writing. Barthes uses the special term 'writing' (*écriture*) to capture this double aspect of the writer. Writing is the middle ground between language, as that which resides in history (the material of writing), and style, as that which is indifferent to history and society (personal contribution to writing). Accordingly, writing is neither strictly historical nor strictly personal; it is an ambiguous reality arising as a confrontation of the writer with society and at the same time referring the writer back to the instruments of creation.

Increasingly Barthes came to adopt a more complex view of language, which enabled him further to develop his critique of the status quo. In general this view followed the linguistic structuralism of the Swiss linguist Ferdinand de Saussure, for whom language as a whole was composed of *langue*, the system of signs that allows for the construction of words in an oppositional phonological play, and *parole*, the actual experience of speaking. From the point of view of semiological analysis (analysis of signs) Barthes opposed the prevailing literary ideology that took the sign as a natural representation of reality rather than an arbitrary convention. This criticism was not limited to literature, which he regarded as only one among many signifying systems. Food, clothing, film, advertising and fashion were also viewed as signifying systems. In this broadened universe of signs Barthes directed his criticism at the bourgeois myths that naturalized objects and events so as to exempt them from political change. In *Mythologies* (1957), for example, Barthes showed how something as simple as a photograph appearing on the cover of the magazine *Paris-Match* can signify bourgeois myth. The photograph depicts a black soldier saluting the flag, signifying that France is a great empire without regard to race. Barthes, however, decoded this sign as an implicit defence of French colonialism. In both literary studies and cultural criticism Barthes' goal was to demythologize the sign system that fulfilled an ideological function (see: Structuralism; Structuralism in literary theory).

2 Post-structuralist criticism

Along with other French intellectuals in the late 1960s, Barthes began to distance himself from the possibility of a science of signs and expanded his critique of writing by adhering to a post-structuralist notion of the text (see Post-structuralism). In his critical analysis of a novella of Balzac, *S/Z* (1970), Barthes insisted that the literary text

must be explored in terms of the way the text outplays the literary codes which structuralism relies upon to make the text intelligible. The theoretical basis for this changed position is laid out in the brief essay 'The Death of the Author' (1968, in Barthes 1977a). Barthes pointed out that the author is a modern figure, the product of a society that has discovered the prestige of the individual. The author is regarded as the father and owner of the text, as the final signified, which preserves the unity of the text and to which all reading is directed. But Barthes insisted that what is written cannot be reduced to the authority of the author any more than language can be viewed as an unambiguous instrument of communication. Drawing from such literary writers as Joyce and Mallarmé, Barthes claimed that to write is to reach the point where it is not the subject who acts, but language. Writing destroys every point of origin so that the author is never more than the instance writing, 'just as I is nothing other than the instance saying *I*' (Barthes 1977a: 145).

With the death of the author the modern text is in the hands of the new 'scriptor' who practises a different kind of writing, one that no longer imposes a limit on the proliferation of signification. Rather than working from a given meaning, the modern scriptor works towards meaning by writing 'intransitively', infinitely deferring the signified and thereby producing a plurality of meaning. Such writing is viewed as a form of liberation, an anti-theological activity refusing God and his hypostases - reason, science, law. In this new mode of writing, traditional criticism, whether biographical, historical or formalist, is undermined. The role of the critic is not to decipher the meaning, looking for the secret of the text, but to disentangle the plurality of meaning, even transposing meaning from the text into different discourses.

Because of the work of the modern 'scriptor', the reader now assumes the important role of providing the unity of the text. This reader, though, unlike the author, is not personal since the reader is without history, biography or psychology. The reader is simply 'that someone who holds together in a single field all the traces by which the written text is constituted' (Barthes 1977a: 148) In holding the text together in this way, the reader no longer regards the text as an object of consumption, but as an activity of production. The reader becomes a collaborator in the very execution of the text, setting the text free towards meaning.

During the 1970s Barthes continued to develop ways to express his scepticism of normative notions in textual criticism. In *Le Plaisir du texte* (1973) (*Pleasure of the Text*, 1975), which theoretically draws loosely on the framework of psychoanalysis, he described reading as a form of pleasure or bliss (*jouissance*) that allows for a free play of meaning from the text. Reading is not unlike a sexual act with the erotic body of language; it is unpredictable, fleeting, and culminates, like orgasm, in its disappearance. The result of this approach to texts was the espousal of discourse as fragment. Stylistically Barthes' own writing became purposefully fragmentary. His autobiography *Roland Barthes par Roland Barthes* (1975) is a classic illustration of a text without unity. In place of an account of a subject with a coherent identity, Barthes writes, in the third person, on the experience of writing and on the distinctive themes that marked his own literary production.

Bartolus of Sassoferrato (or Saxoferrato) (1313/14-57)

The Bartolist school of civil lawyers or 'commentators' dominated university law teaching from the fourteenth century. Challenged by the humanists in the sixteenth century, they remained influential in practice. Bartolus excelled among them in the ability to devise solutions to practical problems and provide clear and workable doctrines applying the civil law texts to legal and political problems.

Born in Sassoferrato, Bartolus studied civil law under Cinus of Pistoia at Perugia from 1328 but his baccalaureate in 1333 and doctorate in 1334 were at Bologna. He practised for a period and was a legal assessor at Todi, then probably at Cagli and finally at Pisa in 1339. In 1339 he became professor at Pisa. In 1342-3 he moved to Perugia, remaining there until his death in 1357. Baldus was his pupil and, from about 1351, his colleague there.

The older name for the 'commentators' is 'postglossators' because they worked from texts of the *Corpus iuris civilis* (body of the civil law) provided in the thirteenth century with a massive apparatus of glosses, the Accursian or great Gloss, which in effect sums up the work of the preceding school of civilians, the glossators. Their commentaries, a product of their teaching, form a major part of their literary output and give them their name. There and in their other works, using the Aristotelian 'new logic', they draw out from text and gloss ideas which they use to solve current problems. The original context of the texts used is scarcely relevant. From civil (and canon) law texts they thus created a living common law to which appeal could be made where local sources were inadequate.

Bartolus was pre-eminent in authority, noted for his practical sense and his ability to get to the heart of a problem and expound it clearly, for example, in conflict of laws, where more than one legal system is potentially applicable to a legal dispute, and in the issue of sovereignty. His views were constantly referred to and commonly deferred to. Like all medieval lawyers he drew on his predecessors, using especially the ultramontane (French) writers of the later thirteenth century who strongly influenced his first teacher, Cinus. Sometimes, therefore, he is given credit for originating ideas to which he rather gave currency, for example, the distinction between 'real' statutes, applying to things (*res*) and so territorial in operation, and 'personal' statutes, applying to those subject to them everywhere. Where he did adopt ideas he nevertheless gave them his own stamp, and by adopting them he ensured their lasting influence.

Bartolus left a huge body of writing, but both manuscripts and prints contain false attributions. His main works were his commentaries (or *lecturae*, literally, readings) on the various parts of the *Corpus iuris civilis*, along with special lectures (*repetitiones*) some of which are preserved separately, advisory opinions to parties or judges (*consilia*), academic discussions of problem cases (*quaestiones*) and treatises (*tractatus*) on individual topics, legal and political.

WILLIAM M. GORDON

List of works

(The dates of publication given are mainly the dates of first printing. There are numerous later editions up to the seventeenth century.)

Bartolus (1333-57) *Quaestiones (Academic Disputations)*, Venice, 1471.(Eighteen disputations; four more in Venice, 1521 edition.)

Bartolus (1339-52) *Lecturae (Commentaria)*, 1st edns from 1470-5 at various locations; facsimile repr. of edn Venice, 1526-9, by and with notes of T. Diplovatatius, 9 vols, Rome: Il Cigno Galileo Galilei.(Commentaries on the texts of the *Corpus iuris civilis*.)

Bartolus (1473) *Consilia (Advisory Opinions)*, Rome.(Both manuscripts and prints contain opinions by others; 244 opinions, 117 more published Venice 1521, a further 38 in later editions.)

Bartolus (1477) *Lectura super Authenticis (Commentaries on the Authenticae [Latin versions of the Justinianic Novels])*, Milan.(Authenticity doubted by Diplovatatius.)

Bartolus (1481-2) *Opera* or *Opera omnia (Works or Complete Works)*, Lyon.(Collected editions appear from Lyon, 1481-2, through to the early seventeenth century. Some, like the first, contain only the commentaries.)

Bartolus (1504) *Lectura Institutionum (Commentaries on the Institutes)*, Pavia.(False attribution; true author may well be Jacques de Révigny.)

Bartolus (1983) *Tractatus de Guelphis et Gebellinis; de regimine civitatis; de tyranno*, ed. D. Quaglioni, Politica e diritto nel trecento italiano, Florence: Il pensiero politico, biblioteca, vol. 11. (Treatises on Guelphs and Ghibellines; the government of a city; the tyrant.)

(1913) *Bartolus of Sassoferrato: His Position in the History of Medieval Political Thought*, Cambridge: Cambridge University Press.(A standard work, with somewhat dated biography; numerous quotations, mainly in Latin, from Bartolus and other sources; gives the gist of quotations but no translation.)

Bataille, Georges (1897-1962)

Georges Bataille was born in Billom, France, raised in Reims, and spent much of his adult life in Paris. Never formally trained as a philosopher, he worked from 1922 to 1942 as a librarian at the Bibliothèque *Nationale. In addition to his philosophical works, Bataille also wrote on the history of art as well as a number of critical works and novels.*

Owing to his position outside academic philosophy, Bataille was able to treat diverse topics in ways which might have been unacceptable otherwise. His work addresses the importance of sacrifice, eroticism and death, as well as the kinds of 'expenditure' evidenced by what he called the general economy. *It draws on diverse sources (Hegel, Nietzsche, Marcel Mauss, anthropological research, and the history of religion, among others) and treats a wide range of topics: the role of art in human life, the practice of sacrifice in ancient and modern cultures, the role of death in our understanding of subjectivity, and the limits of knowledge.*

Bataille's major works include: *L'Expérience intérieure* (1943) (*Inner Experience*, 1988; composed 1941-2; materials from 1924 on), *La Part maudite* (1949) (*The Accursed Share*, vol. 1, 1949; vols 2-3, 1976; written 1946-9; planned as early as 1930), *L'Érotisme* (1957) (*Erotism, Death and Sensuality*, 1986; planned from 1930), *Sur Nietzsche* (1945) (*On Nietzsche*, 1992; written mid-1940s) and *Théorie de religion* (1974) (*Theory of Religion*, 1989; composed late 1940s). He is known largely for his connections with Surrealism, although his alliance with the movement was often strained. He is also considered an important forerunner of 'postmodernism', although he died before the word was coined. Much of his work manifests a resistance to systematicity and a desire to produce texts (which he called *heterologies*) which escape unitary interpretations. Such heterologies concern what is entirely other, and thus resist being reduced to the identities necessary for thought and language. The attempt to think the heterologous means to think that which is outside, and thus to transgress the bounds of thought (which remains, in an important way, an impossible undertaking). Bataille names that which transcends the bounds of science, the everyday, and time the *Sacred*. His work on general economy, however, owing to the influence of Mauss, shows certain systematic and structuralist tendencies.

Many of Bataille's most important texts comprise what he called *La Somme athéologique*, which analyses the Sacred at both individual and societal levels. At the most individual level (that of *inner experience*), Bataille investigates the possibility of transcending our everyday understanding of individuality without losing all notions of subjectivity. These investigations are oriented towards no particular goal or knowledge, but begin with a 'phenomenological' account of experience itself. Drawing on Nietzsche, Bataille insists that experiences and sensations take place before there is a subject to experience them; the subject is only established in and through experience. Moreover, if one chooses the right sorts of experience (those of intense suffering), a point is reached where pain ceases to be felt and one's own subjectivity is transcended. Since this experience is often followed by death, research into this kind of transcendence is both dangerous and difficult to replicate. It was these dangers, at least in part, which led Bataille to develop alternative accounts of the move towards the Sacred. What remains constant, however, is the important place he gave to the notion of death.

Later, Bataille developed the important systematic notion of *general economy* with its emphasis on *expenditure*. Focusing on surplus and expenditure as the primary notions of economics (rather than on scarcity, as standard economic models do) allows Bataille to link his work on political economy with his work on inner experience, eroticism and religion, all of which he characterizes as displays of excess or surplus. Here the Sacred is expressed in social practices rather than individual experiences. By focusing on social behaviour which exceeds the limits of (instrumental) rational explanation (such as Amerindian *potlatch* ceremonies), Bataille highlights the myriad ways in which human life and practice resists rational description.

The concept of a general economy of energy flows allows one to analyse not only economic phenomena but social, anthropological, biological and physical ones as well. The fundamental problem with which the general economy must deal is that of excess. The earth has a constant supply of new solar energy which must be either taken up or dispersed in some way. Societies, which draw on this energy, quickly reach a point where production exceeds necessity. The process by which this excess is dealt with is expenditure, which often takes place in a way which expresses the Sacred: through sacrifice or warfare. Such sacrifice may take a literal form (as in Aztec society) or a

more figural one as in the modern culture of conspicuous consumption.

Practices such as sacrifice and warfare serve the Sacred by elevating those who are destroyed, together with that in whose name the destruction occurs, above the realm of mere things. Even the victim is elevated; for the destruction that sacrifice is intended to bring about is not annihilation (Bataille 1974: 43).

The Sacred in general removes things from the realm of mere usefulness and thus elevates them above time and its laws of necessity and causality. It not only leaves the realm of reason and discourse behind (which is part of what makes it so difficult for Bataille to discuss it), but actually destroys them (at least temporarily) as well. The human move towards the Sacred is thus beset with a major difficulty. On the one hand, the Sacred allows humans to separate themselves off from the realm of necessity by moving towards transcendence. But if such transcendence leaves the realm of necessity entirely behind, it results in death. Bataille's proposed solution to this problem is to limit moments of sacrifice so that their transcendence *of* time is still caught up *in* time. The first example of this is the festival; the second is war (which still results in death for many of its participants).

Bataille also treats the problem of transcendence through investigations of eroticism. Eroticism is simultaneously the most potent form of embodied experience and one which, like a Dionysian festival, transcends (at least for a time) bodily and temporal limits. And, like the festival, such experiences risk absolute annihilation but usually end with a return to the everyday (although not the same everyday).

JONATHAN MASKIT

List of works

Bataille, G. (1970-88) *Oeuvres complètes*, Paris: Gallimard.(The standard French language edition of Bataille's complete works. Much of this material is unavailable in English.)

Bataille, G. (1927-39) *Visions of Excess: Selected Writings, 1927-1939*, ed.A. Stoekl, trans. A. Stoekl, C.R. Lovitt and D.M. Leslie, Jr, Minneapolis, MN: University of Minnesota Press, 1985.(A good selection of some of Bataille's early, shorter works on a variety of topics.)

Bataille, G. (1943) *L'Expérience intérieure*, Paris: Gallimard; trans. L.A. Boldt, *Inner Experience*, Albany, NY: State University of New York Press, 1988.(The most important work in *La Somme athéologique*. Treats the problem of transcendence from an individual perspective.)

Bataille, G. (1945) *Sur Nietzsche*, trans. B. Boone, *On Nietzsche*, New York: Paragon House, 1992.(Part of *La Somme athéologique*. Far more an investigation of Bataille's Nietzscheanism than of Nietzsche.)

Bataille, G. (1945-51) *The Absence of Myth: Writings on Surrealism*, ed. and trans. M. Richardson, London: Verso, 1994.(Together with *Visions of Excess*, a good selection of Bataille's shorter pieces. These treat not only Surrealism but also the notion of the Sacred.)

Bataille, G. (1949) *La Part maudite*, vol. 1, *La Consommation*, Paris: Éditions de Minuit; trans. R. Hurley, *The Accursed Share*, vol. 1, New York: Zone Books, 1991.(Bataille's definitive text on general economy. The most important work in the later part of *La Somme athéologique*. Volume 1 treats historical sources and the importance of sacrifice.)

Bataille, G. (1957) *L'Érotisme*, Paris: Éditions de Minuit; trans. M. Dalwood, *Erotism, Death and Sensuality*, San Francisco, CA: City Lights, 1986.(Very similar to what would be published in English as volume 2 of *The Accursed Share*. Treats eroticism in connection with death and transcendence.)

Bataille, G. (1962) *Les Larmes d'Éros*, Paris: Éditions Pauvert; trans. P. Connor, *The Tears of Eros*, San Francisco, CA: City Lights, 1989.(Discusses the importance of the Sacred in art.)

Bataille, G. (1974) *Théorie de religion*, Paris: Gallimard; trans. R. Hurley, *Theory of Religion*, New York: Zone Books, 1989.(More a theory of sacrifice and transcendence than a conventional theological text. A shorter treatment of many of the topics addressed in *The Accursed Share*.)

Bataille, G. (1976) *The Accursed Share*, vols 2 and 3, trans. R. Hurley, New York: Zone Books, 1993.(Compiled for the *Oeuvres complètes* from (mostly) unpublished materials. Volume 2 is a history of eroticism, volume 3 treats the notion of sovereignty and the development of the Soviet economy.)

References and further reading

Bergfleth, G. (1975) *Theorie der Verschwendung (Theory of Extravagance)*, Munich: Matthes & Seitz, 1985.(A very good treatment of the distinction between restricted and general economy, but also of the notions of

heterology and sovereignty. Also includes a chapter on the relevance of Bataille's thought for environmentalist philosophy.)

Boldt-Irons, L.A. (ed.) (1995) *On Bataille: Critical Essays*, Albany, NY: State University of New York Press.(A good collection of recent scholarship on Bataille, offering clear treatments of several important issues: heterology, inner experience, expenditure, and Bataille's relation to the history of philosophy.)

Cordier, S. (ed.) (1962) *Bataille*, special issue of *L'Arc* 44, Aix-en-Provence.(Published the year of Bataille's death. Contributions from his colleagues. An interesting collection.)

Derrida, J. (1972) 'From Restricted to General Economy: A Hegelianism without Reserve', trans. A. Bass, in *Writing and Difference*, Chicago, IL: University of Chicago Press, 1978.(Treats the importance of Hegel in Bataille's work on general economy, thus arguing against more Nietzschean interpretations.)

Fourny, J.-F. (1988) *Introduction à la lecture de Georges Bataille (An Introduction to Reading Georges Bataille)*, New York: Peter Lang.(A good introduction to Bataille's work as a whole.)

Habermas, J. (1985) 'Between Eroticism and General Economics: Georges Bataille', trans. F. Lawrence, in *The Philosophical Discourse of Modernity*, Cambridge, MA: MIT Press, 1987.(A very clear treatment of the concept of general economy, stressing Bataille's Marxist leanings.)

Hollier, D. (1974) *Against Architecture*, trans. B. Wing, Cambridge, MA: MIT Press, 1990.(Treats the importance of architectural metaphors in Bataille as a way of understanding his resistance to systematicity. Often obscures as much as it clarifies.)

Richardson, M. (1994) *Georges Bataille*, London: Routledge.(A clear but somewhat misleading introduction. Seeks to show that Bataille is not, *pace* many other commentators, a postmodernist.)

Richman, M. (1982) *Beyond the Gift: Reading Georges Bataille*, Baltimore, MD: Johns Hopkins University Press. (A very good introduction to Bataille focusing on the importance of expenditure and general economy. Probably the clearest book on Bataille in English.)

Wiechens, P. (1995) *Bataille: zur Einführung (Bataille: An Introduction)*, Hamburg: Junius Verlag. (A good general introduction to all of Bataille's work. Clearer than anything available in English.)

Baudrillard, Jean (1929-)

Jean Baudrillard taught for most of his career at the Nanterre campus of the University of Paris in the department of sociology. He began writing as a neo-Marxist in the tradition of Henri Lefebvre and Herbert Marcuse but very quickly developed his distinctive style of social and cultural criticism. He may be understood generally as a post-structuralist who focused on the importance of language in society and invented novel concepts and terms to understand the most advanced features of electronic communications. He has been hailed as the guru of postmodernity and berated as faddish trend follower. He has written polemical pieces like Oublier Foucault (1977)(Forget Foucault, 1987) and controversial ones such as La Guerre du Golfe n'a pas eu lieu (1991b) (The Gulf War Did Not Take Place, 1995).

Baudrillard's significance for social philosophy rests with his effort to theorize aspects of popular culture that were generally regarded with disdain (by the Frankfurt School and many others) or uncritically celebrated (by Marshall McLuhan in particular). Baudrillard brought an unprecedented seriousness of theoretical purpose to the questions of the media and consumer culture. It is important to recall this fact because recently he has been denigrated as an unserious intellectual 'star'. From his earliest works, *Le Système des objets* (1968) (*The System of Objects*, 1996) and *La Société de consommation* (1970), Baudrillard attempted to account for the increased prominence of the media in society and the rising significance of consumerism in daily life. In these works he deployed Marxist categories but added semiological and psychoanalytic dimensions to his analysis. Consumption, he argued, must be approached as a system of signs with its own internal quality of articulation, not explained away by categories geared to the process of production or by liberal political complaints. Already in these early writings he employed a post-structuralist method to make intelligible a newly emerging social/cultural sphere. This was so because Baudrillard aimed his theorizing of consumer culture against the liberal logic of *homo economicus* as well as the productivist emphasis in Marxism. In order to theorize the world of consumption, he argues, one must abandon the 'modernist' theoretical fiction of the autonomous rational individual, one who always calculates their utilities for happiness, and abandon as well the socialist view of the worker as a resisting agent upon whom capitalism imposes structures of domination. Baudrillard's early theory of consumer culture was post-structuralist in the double sense that it understood the subject as historically constituted and it recognized the salient role of language in that process of constitution. By bringing these interpretive strategies to the domain of everyday life Baudrillard revolutionized our understanding of them.

Baudrillard definitively broke with Marxism in his works of the mid-1970s: *Pour une critique de l'économie du signe* (1972) (*For a Critique of the Political Economy of the Sign*, 1981), *Le Miroir de la production* (1973) (*The Mirror of Production*, 1975) and *L'Échange symbolique et la mort* (1976) (*Symbolic Exchange and Death*, 1993). In these books Baudrillard specified how media culture and advertising in particular constituted a 'code' which had great influence on individuals. The 'code' was the essence of consumption. People consumed not so much objects but images, ideals, fantasies, styles - all of which were structured through advertising and presented in the electronic media, a strange new dimension of social life which altered forever the older 'bourgeois' culture of modern society. Individuals, Baudrillard argued, construct themselves, or better, their identities in and through their response to advertising and the media. It was pointless to bewail the quality of television shows or consumerism as many liberals and Marxists did because 'vulgarity' and 'exploitation' were irrelevant to the new consumer world. In the malls and shopping centres, in radio and TV ads, a culture was constructed that was capturing the attention and the imagination not only of the masses in the industrialized societies but in the Communist societies of Eastern Europe and in much of the 'Third World' as well. The problem for social theory was to understand how this new world of signification worked, not simply to condemn it in a futile gesture of snobbery. Baudrillard turned to semiology to analyse the structure of advertising and he demonstrated how ads restructured language in such a way that the word 'Coca Cola' would refer not so much to a brown bubbly liquid, its 'referent', but to the images of youth, sexuality and fun that were presented in ads for the product. In the 1970s Baudrillard went so far as to argue in *À l'ombre des majorités silencieuses* (1978) (*In the Shadow of the Silent Majorities*, 1993) that the masses' apparent apathy and lack of revolutionary fervour was in actuality a new form of resistance against the system.

In a series of works in the 1980s and 1990s Baudrillard developed his analysis of media advertising into a general

understanding of postmodern culture. From *Simulacres et simulations* (1981) (*Simulacra and Simulations*, 1994) to *L'Illusion de la fin* (1991a) Baudrillard presented an important argument that reality itself was changing as a consequence of the new consumer culture. As people spent more and more time with electronic communications (tuned into the radio, glued to TVs, jacked into computers, turned on to walkmen and ghetto blasters, conversing on telephones, sending faxes, receiving e-mail), more time exchanging symbols through the mediation of increasingly smart machines, the world of face-to-face was becoming the world of the 'interface'. Baudrillard called this emerging culture 'the hyperreal'. Hyperreality was built upon new cultural principles. Symbolic constructions were no longer rooted in an original reference such as a spoken conversation or a written letter. Now language was increasingly 'simulational' in the sense that the presentation is always both an original and a copy. The TV news does not really report about something in an 'external' world: it makes important what it states, creating news as it 'reports' about it. This difficult logic, 'Hyperreality', increasingly dominates the exchanges of words and images, gradually forming a new and very strange culture. If Baudrillard's importance rests on the attention he paid to new cultural formations, his limitations are an overly pessimistic assessment of them, a failure to recognize their limitations, and an inability to take into account new assemblages of humans and machines.

Bauer, Bruno (1809-82)

The career of the Hegelian theologian Bruno Bauer is marked by his sudden turn from a reasoned defender of Christianity into one of its most extreme critics. His radical interpretation of Hegel's philosophy, which he first used to defend orthodox biblical hermeneutics, ultimately led him to become, as one of his admirers said, the 'Robespierre of theology'. As the leader of the so-called 'Young Hegelian' school, Bauer was one of Hegel's most gifted students. However, his condemnation of theology in general and his thesis that the New Testament was merely the fictional product of an unknown author contributed to the general distrust of Hegelianism among religious thinkers. Although his many theological and historical writings now remain largely unread, his 'Critical Philosophy' and his radical atheism exerted a strong influence upon Marx, who was his student and friend, and is still evident in such contemporaries as Jürgen Habermas.

1 The Young Hegelian

Bauer entered the University of Berlin in 1828, and gave himself completely over to Hegelianism. From the earliest period of his career until his death, Bauer was concerned with the 'reconciliation' of Hegelianism and orthodox religion - the theme of his doctoral dissertation and final works (see Hegel, G.W.F. §8; Hegelianism §2). However, as his thought developed, Bauer took 'reconciliation' to mean that the religious mind, which had created a history of God out of its own unconsciousness, could only cure itself by coming into a full and critical self-consciousness towards its own unconscious fantasies.

In his first years as a lecturer, Bauer published forty-three articles and reviews. In these first writings, it was his intention to elevate theological consciousness to a speculative level which would resolve the debates between faith and critical reason, a resolution which would occur in the higher synthesis of Hegelian speculation.

In 1835, David F. Strauss' *Das Leben Jesu (Life of Jesus)* was published (see Strauss, D.F. §1). For Strauss, the New Testament was fundamentally a literary creation generated out of the Messianic expectations of the Jewish people, having little or no historical foundation. The miracle stories were merely pre-Christian 'myths'. The orthodox Hegelians, whose careers were threatened by Strauss' claim that his work was inspired by Hegel, asked Bauer to refute Strauss. Bauer's reply to Strauss, which appeared in a series of articles, attempted to demonstrate that such gospel miracles as the Virgin Birth were the necessary consequences of the historical development of human self-consciousness. Bauer's refutation contained the seed of Bauer's own radical view of the Gospels: that they were merely the fictional creations unconsciously designed to satisfy the needs of the religious mind for some external salvation.

In 1838, Bauer first formulated his own view of the relationship between philosophy and religion in a two-volume work: *Die Religion des Alten Testaments in der geschichtlichen Entwicklung ihrer Principien dargestellt (The Religion of the Old Testament Presented in its Historical Development and Principles)*. This work continued Bauer's efforts to treat the Gospel stories as the unconscious expressions of the religious mind, and to trace their historical development. By 1840, he had written a number of multi-volume studies devoted to explaining that biblical history was fundamentally an imaginative exercise of the religious mind, with little or no actual basis in fact. This thesis was set forth in his *Kritik der evangelischen Geschichte des Johannes (Critique of the Gospel of John)*. From this point on, Bauer would identify his own position as that of 'critic' and would term his philosophy 'criticism'.

By the end of June 1840, Bauer began another major study of the gospels, the three-volume *Kritik der evangelischen Geschichte der Synoptiker (Critique of the Synoptic Gospels)*. In this work the problem of whether or not Jesus was in fact a historical figure was finally resolved: 'To the question of whether Jesus was an authentic historical figure we replied that everything relating to the historical Jesus, all that we know of him, relates to the world of fancy, to be more exact - to Christian fancies. This has no connection with any man who lived in the real world'. In the autumn of 1840, Bauer concluded the writing of *Die Posaune des jüngsten Gerichts über Hegel den Atheisten und Antichristen: Ein Ultimatum (The Trumpet of the Last Judgement Against Hegel the Atheist and Antichrist: An Ultimatum)*. This anonymous work was to rally all the various interpreters of Hegel into one camp from which they could enter into what he termed 'The Campaign of Pure Criticism'. It asserted that the prudent 'Old Hegelians' associated with German academic life had consciously concealed the total incompatibility of

Hegelian philosophy with traditional Christian belief and conservative political order.

In the early 1840s Bauer was the leader of Berlin's notorious club, 'The Free Ones'. This group was the focal point of the radical 'Young Hegelians' - a forum for the discussion of atheism and radical politics. Among the participants were his own brother Edgar, the young Friedrich Engels, and a new friend, the radical individualist Max Stirner. However, by 1844, Bauer's theoretical and theological concerns were rapidly losing their importance among the radical Hegelians, as they were becoming more concerned with applying their theory towards the practical overthrow of the reactionary forces controlling German political life. Concerned with revolutionary deeds, and preparing for the establishment of a new democratic order, the new generation of radicals rejected Bauer's speculative 'Terrorism of Pure Theory'. Within a few years, Bauer's influence upon such revolutionary Hegelians as Marx and Engels came to a end.

2 Later years

In 1843, Bauer wrote *Das Entdeckte Christentum (Christianity Exposed)*, a work intended to bring about a general appreciation of atheism through a rough dissection of Christian attitudes. His belief that the Enlightenment and its 'Age of Reason' embodied his Hegelian trust in the rationality of the real occasioned his next project, the four-volume *Geschichte der Politik, Cultur und Aufklärung des achtzehnten Jahrhunderts (History of the Politics, Culture and Enlightenment of the Eighteenth Century)*. In 1846, having concluded his final volume, he continued his historical studies with the issue of the two-volume *Geschichte Deutschlands und der Französischen Revolution (History of Germany and the French Revolution)*. These works constituted a complete cultural and political history of the Enlightenment. Given Bauer's scorn of pietistic Christianity and his admiration for the atheists of the Enlightenment, it is not surprising that he considered it to be mankind's greatest age.

In 1847, Bauer, with his usual energy, wrote a three-volume study looking back upon the political events of his own lifetime: *Vollständige Geschichte der Parteikämpfe in Deutschland 1842-1846 (The Complete History of Party Struggles in Germany During the Years 1842-1846)*. Contrary to its title, the third volume covered only the events up to 1844; a fourth volume was to extend the time frame to 1847. But the Revolution of 1848 intervened, and the final volume was never completed. The volumes are a chronicle of disappointments, from the first deceptively liberal appearance of King Friedrich Wilhelm IV, to the increasingly oppressive measures taken by both state and church throughout the 1840s to stifle democracy. They are bitter works, angry at the passivity of the people, and their temper was reflected in shorter articles of the same period, such as 'Die Gattung und die Masse' ('The Genus and the Crowd').

In 1852, Bauer returned to theological subjects, and composed *Die theologische Erklärung der Evangelien (The Theological Explanation of the Gospels)* - intended to be the fourth and final volume of his earlier series, *Kritik der evangelischen Geschichte der Synoptiker*. This particular volume brought to a close his criticism of Strauss' 'Tradition Hypothesis' and Bauer developed his theory of the *Urevangelist* - the actual writer who composed the original fictional life of Jesus.

In the next year, with the Crimean War imminent, Bauer wrote a series of studies dealing with the relationship of Russia to the rest of Europe. The first, in 1853, was *Rußland und das Germanentum (Russia and the Germanic World)*. It warned of the growing power of Russia, and was followed by other studies focused upon the same issue, such as his 1854 *Deutschland und das Russentum (Germany and the Russian World)*. This work was a model for later German nationalistic philosophies of history, in which Germany was seen as the destined, yet scorned, leader of the West.

In 1859, after a few years in various insignificant editorial posts, Bauer became the associate of Hermann Wagener, the editor of such ultra-conservative papers as the *Staats-und-Gesellschaftslexikon*, *Kreuzzeitung* and *Berliner Revue*. Wagener was not only scornful of the weak democratic forces in Prussia, but virulently anti-Semitic. However, Bauer's anti-Semitism, as his early essay on the 'Jewish Question' indicates, was not an expression of Prussian nationalism, but concerned the nature of the Jewish religion itself. He condemned Judaism as the source and support of Christianity - the prime obstacle to human progress. Bauer wrote no anti-Semitic articles for Wagener.

In his last works, which he produced sporadically until his death in 1882, Bauer fully developed the theory which he had first proposed in the early 1840s - that it was not Jesus or Paul, but Seneca and Philo who were the spiritual

creators of the basic gospel story. Today, Bauer's biblical studies are almost totally forgotten, and perhaps rightly. However, his reading of Hegelianism as a revolutionary and atheistic humanism not only set the general course of Young Hegelianism, but remains a viable perspective.

Baumgardt, David (1890-1963)

Baumgardt's early works dealt with the problem of modalities in the philosophies of Kant, Husserl and Meinong and with German philosophical romanticism, especially in the mystic Franz von Baader. Although he never engaged in systematic inquiry into Judaism or Jewish philosophy, he was fascinated by the Jewish religious legacy, and his philosophical reflections on Jewish issues were integral to his philosophical work. A secular Jew, he associated himself with the liberal trends within Judaism. The Jewish philosophers he most highly prized were Maimonides, Spinoza and Mendelssohn. The chief goal of his Jewish studies was to promote those beliefs in Judaism that are of ethical significance and to draw out the import of the moral demands found scattered throughout the ancient Jewish Scriptures. Baumgardt's concern with ethics grew with his increasingly critical stance towards traditional religion. In that vein, he laid great stress on the distinction between knowledge and belief and on that between Jewish rituals and their underlying meaning.

Baumgardt's work did not receive the attention it deserved, because his career at the University of Berlin (1924-1935) came to an abrupt end with Hitler's rise to power. He was a visiting professor at the University of Birmingham, England from 1935 to 1938 and at Pendle Hill, Pennsylvania from 1939 to 1941. From 1941 to 1954 he served as a consultant on philosophy for the Library of Congress. He thus remained a kind of an outsider, publishing relatively little during his lifetime.

Refusing to draw any clear cut line between Jewish religious problems and general philosophical ones, Baumgardt was much attracted by ethical quandaries like that posed in the biblical story of the *Akedah* or binding of Isaac (Genesis 22), where the matter was not of choosing between two rights but between two wrongs: that of disobeying God's command and that of killing one's son. Finding no comfort in the many traditional responses to the ancient story, Baumgardt saw its outcome as a sheer aporia and turned increasingly to a form of ethical hedonism as the foundation of his moral philosophy. Some types of hedonism, he argued, must frame the 'supreme rational command'. But even such a philosophy, he argued, 'leaves to us the risk and responsibility of applying the command properly'.

Baumgardt's main contribution to philosophy was in the field of ethics. In 1933 he published *Der Kampf um den Lebenssinn unter den Vorlaeufern der modernen Ethik (The Struggle for the Meaning of Life among the Precursors of Modern Ethics)*. Because of the rise of the Nazis the work passed almost unnoticed. In it Baumgardt investigated and criticized the ethical ideas of Kant, whose formalism aroused his resentment, of Herder, Hemsterhuis and Jacobi, all of whom he presented as precursors of modern ethics. As a foil to the shortcomings of their ethical conceptions, he called attention to the ethical ideas to be found in the Bible and the Talmud. But these allusions to Jewish ideas, although they reflect Baumgardt's frame of mind and commitment to his Jewish legacy, did not play any important theoretical role in his ethical investigations.

In his unpublished *History of Modern Ethics* Baumgardt essayed a synoptic view of the ethical theories of the past two hundred and fifty years. He was especially drawn to the utilitarianism of Bentham, which he came to know well in England. His book *Bentham and the Ethics of Today* (1952) included hitherto unpublished writings of Bentham, and Bentham's utilitarianism provided the point of departure for his own ethical hedonism. Seeking to rehabilitate a philosophical tradition stigmatized since antiquity as advocating mere pleasure-seeking, Baumgardt drew inspiration from two sharply opposed philosophical orientations: Bentham's empiricist utilitarianism and Kant's metaphysical morals. What he admired in both was the attempt to lay rational and critical foundations for a secular and autonomous ethics. By creating a synthesis between the two, he hoped to deliver his 'critical hedonism' from the pragmatic bent of traditional utilitarianism. This project came to its fullest expression in his posthumous *Jenseits von Machtmoral und Masochismus (Beyond the Morality of Power and Masochism)* (1977), whose subtitle reads *Hedonistische Ethik als kritische Alternative (Hedonist Ethics as a Critical Alternative)*. Despite the work's many interesting ideas, it remains questionable whether it can forge the hoped-for alternative. It does not refer to any works on ethics later than Sartre's writings of the 1940s, and pays almost no attention to analytic philosophy or to Wittgenstein, whose impact on ethical theory cannot be ignored.

Kant and Bentham were contemporaries of one another, and for Baumgardt they remained our contemporaries as well. As regards Kant, Baumgardt was only one among many scholars who investigated his philosophy, but with

regard to Bentham he was one of the most insightful.

In chapters 5 and 6 of *Jenseits von Machtmoral und Masochismus*, Baumgardt asks whether the idea of pleasure can be made a basis for the maximization of happiness and the overcoming of meaningless suffering. This, he argues, requires a 'Copernican revolution' in ethics: while egoistic hedonism is concerned exclusively with the pleasure of the self and is indifferent to the suffering of others, a consistent hedonism will strive for the maximization of happiness. This much is little more than the undergirding of Bentham's move from egoism to the greatest happiness principle. But Baumgardt goes on to argue, in more Kantian vein, that appeals to happiness can be deemed morally valid only if they corroborate the principle of greatest happiness by creating a harmonious coherence among all concerned. The point, however, is not to praise or blame human motives but, rather, to evaluate the outcomes of human action.

Although Baumgardt, like most hedonists, grounded his ethics in naturalism, he did not offer any convincing proof of the chief argument of ethical hedonism, the claim that human pursuit of pleasure entails the ethical value of that pursuit. That is, he offered no convincing argument against the objection that in moving from is to ought one commits a naturalistic fallacy.

Although Baumgardt's ethical work, scattered in his articles and notebooks, and in part published posthumously, was not brought to a systematic conclusion, his rehabilitation of hedonism as a legitimate ethical option is a worthy achievement. The achievement is marred by his lack of a systematic meta-ethics and a weakness in the account of pleasure that he shares with Bentham: individual pleasure is subjective and context-dependent, while pleasure in his more general sense that is most relevant to the greatest happiness principle is linked to interests, ideals, aspirations and goals that can be shared by many. Baumgardt's critical hedonism, a typically reductionist theory, tries to reduce all these to a single measure, Bentham's pleasure/pain principle. And, like earlier hedonist theories, Baumgardt's account has not paid sufficient attention to the cognitive status of deontological assertions. It does, however, represent an important challenge, by a philosophically adept outsider, to modern ethical theory.

Baumgarten, Alexander Gottlieb (1714-62)

The German philosopher Baumgarten is known primarily for his introduction of the word 'aesthetics' to describe the affects of art and nature, which in the course of the seventeenth century replaced the older theory of beauty. Baumgarten derived the term from the Greek aisthanomai, *which he equated with the Latin* sentio *(1739: 79). He understood it to designate the outer, external or bodily sense, as opposed to the inner sense of consciousness. Thus aesthetics is the realm of the sensate, of sense perception and sensible objects. Baumgarten understood his usage to be consistent with classical sources, but he was aware also that he was extending logic and science into a new realm. Baumgarten's importance lay in adapting the rationalism of Leibniz for both the study of art and what came to be known after Kant as the aesthetic.*

1 The aesthetic as a 'confused' concept

Baumgarten accepted the fundamental rationalist, epistemological division between what is clearly and distinctly known, on the one hand, according to concepts and reason and what is known, on the other, by sense. The latter apprehension is 'confused' in a sense that can be traced back to medieval discussions of the problem of universals. According to medieval realism and conceptualism, only the universal deserves the definite article and provides clear, distinct apprehension. So 'the rose' refers not to some existing rose but to the universal type. To refer to a specific rose, one must individuate it either as 'this rose' when dealing with an existential application (cf. *Metaphysica*, para. 151) or as 'a rose' when dealing with an individual which may or may not actually exist. Both the individuation and its indefinite extension are dependent on sense in a way that the universal is not. Both can be said to 'confusedly' represent, therefore, because their referents are present only in limited perceptible and temporal forms, all of which lack some essential distinctness. In this sense, a confused presentation is not faulty or unclear; it is simply lacking in the kind of clarity which only the universal can provide. Its sensate forms limit it. Baumgarten adopted this distinction in describing aesthetic discourse. The aesthetic is sensate and confused or indistinct in this specialized sense.

It does not follow, however, that the aesthetic cannot be clear within its own cognitive sphere. Obscurity and clarity are matters of content. Something is clearer if a higher number of its sensate representations are available. So if one sees an object from all sides, for example, one sees it clearly. If one sees it only from one perspective at a distance, it is seen obscurely. The aesthetic permits an extensively clear form of representation which is determinate and individual. From the standpoint of promoting art, therefore, greater extensive clarity and determinateness are positive features, which enhance the aesthetic effect.

Baumgarten took discourse as the primary form of the aesthetic. Discourse can be construed broadly here, since Baumgarten acceded to Horace's equation of poetry and painting (1735: 52). Representations themselves include both images derived from sense and direct sense-perception. They are combined into thematic wholes on the basis of the connection of the images and resemblance between images. Such wholes are simple or complex, but since complexity is understood as having many themes, not parts, simplicity is an aesthetic virtue. Perceptions and images (which are secondary perceptions) are confused representations because they are not abstract, intelligible forms, which alone would be conceptually distinct. But while they lack intensional clarity, they may have great extensional clarity, and may form thematic wholes based on resemblance, the connection of the images, and ordering of the sensate elements. Baumgarten applied this scheme to poetry and poetic language in his *Meditationes philosophicae de nonnullis ad poema pertinentibus* (1735, translated as *Reflections on Poetry*), and he suggested ways in which it would also apply to painting, sculpture and music. His goal was a science of the perceptual realm that would parallel the more precise sciences of metaphysics and logic.

2 Aesthetic implications

A number of points in Baumgarten's aesthetics bear on later developments in aesthetics. He focused on the affective side of perception. Sensate representations are 'marked degrees of pleasure or pain' (1735: 47). Stronger impressions are more poetic because their impressions are extensively clearer (1735: 27). On the other hand, Baumgarten distinguished aesthetic effects quantitatively, not qualitatively. It is not that feelings of pleasure are intrinsically valuable, but that more effects contribute to a greater perfection of the discourse. The closest that Baumgarten came to a qualitative aesthetic is in his discussion of 'the wonderful', which he characterized as an

intuitive grasp of the inconceivable that is not present in perception (1735: 53). He was obviously trying to account for the sense of awe or wonder that is one of the classical marks of the sublime, yet he still explained it in essentially quantitative terms. The wonderful is an intuition of something that is not present. Hence it is an added element in the aesthetic. It depends on a mixture of the unfamiliar and the familiar, and since it cannot be traced to sense impressions, gives a scope to the imagination it would not otherwise have. However, it provides little justification for promoting feeling directly to prominence. Baumgarten is at the opposite extreme from Friedrich Schleiermacher in his regard for intuitive feeling.

Baumgarten also gave scope to the imagination in a way that reveals a contrast with later exaltations of imagination as the aesthetic faculty. The imagination is productive of fictions. But fictions are categorized in terms of possible worlds. True fictions are possible in this world. The imagination may go beyond what is actually perceived to what may very well be the case. When a painter poses figures to construct a tableau, his painting is a fiction, but a possible representation of an actual event. There could be such an event, and for all we know, this is how it may have looked. Fictions *per se*, however, are impossible in this world. They may be divided into those which are impossible in all worlds, called utopian fictions, and those which are impossible in this world but possible in some world, called heterocosmic fictions. There are no centaurs, and such combinations are biologically impossible. But they are nevertheless possible in some world, whereas a round square is not possible at all. Since utopian fictions cannot be represented, they cannot be aesthetically significant. But heterocosmic fictions can be represented, and in fact art depends on such fictions for its greater extensive clarity and determinateness. Baumgarten arrived at an implicit defence of fictions quite different from the earlier Aristotelian and subsequent Romantic defences, which are based on the positive emotional effects of the imagination. For Baumgarten, fictions and the imagination are needed because they extend the aesthetic beyond the reach of mere sense, without converting it into rational concepts.

Baumgarten thus remained firmly within the rationalist camp. The aesthetic is clearly a lower faculty: ‘Therefore *things known* are to be known by the superior faculty as the object of logic; *things perceived* [are to be known by the inferior faculty as the object] of the science of perception, or aesthetic’ (1735: 78). But Baumgarten expanded the scope of knowledge in interesting ways. He expected the aesthetic to be a science with its own logic, and in the final, fragmentary ‘Kollegium über die Ästhetik’, he acknowledged that sensate knowledge is the foundation of clarity and that the aesthetic must come to the aid of logic. The aesthetic is limited by its sensate representations and the imagination must be restricted in order to avoid licence, but within these limits the aesthetic is a legitimate source of a kind of knowledge. The standard remains rational distinctness, but while it is possible to mix distinct, conceptual elements with confused, perceptual elements in complex representations, the aesthetic is independent of the distinct conceptual forms. When conceptual forms dominate, one loses the aesthetic effects. The aesthetic may still be a lower form, but it is legitimate within its own realm, and Baumgarten came close to acknowledging that the aesthetic could be a clearer and more effective form of knowledge than a priori rational concepts for all but the most accomplished metaphysicians.

3 Tensions within Baumgarten’s system

The value that Baumgarten assigned to the aesthetic produced some tensions within his system. His ideal was knowledge, and the goal of knowledge is to build a science. So Baumgarten set out to create a science of the sensate. But he also recognized that the rational, conceptual distinctness which he took to characterize knowledge is antithetical to the confused, indistinct, sensible impressions and images on which the aesthetic depends. So the more scientific aesthetics becomes, the more it is in danger of ceasing to be aesthetic. The incompatibility of the rational and aesthetic realms (1735: 42) exposes the inconsistency between Baumgarten’s goal of pure knowledge and his defence of sensate discourse. The classical way to resolve this inconsistency was to leave the aesthetic behind as one progressed up the ladder of consciousness. Baumgarten continued to adhere to that classical model in which aesthetics is the product of a lower faculty and is limited to a helping role, but he also separated and gave independence to sensate representations, which suggests that there are simply two different forms of knowledge.

Two themes in Baumgarten’s work illustrate how the tension between reason and sensibility arose and how he tried, unsuccessfully, to resolve them. First, Baumgarten’s appeals to sensation are essentially quantitative. Consider an instance of sensate discourse. It will be more or less aesthetic depending on its extensive clarity, determinateness and specificity. All of these characteristics are consistent with, and in fact require, confused or

indistinct representations, since the discourse would cease to be sensate if it became distinct. The standard of judgment is aesthetic perfection. The aim of the aesthetic is the perfection of sensitive cognition as such; that is also what is meant by beauty (1750: 14). Baumgarten was led to this quantitative standard because it was consistent with his rational epistemology, which was based on completeness. (Quantity in this sense is not inconsistent with simplicity as long as the quantitative impressions are united by a single theme or object.) But while his aesthetics is based on sensibility, it is not based on feeling. So while Baumgarten recognized the close connection between sensate impressions and pleasure or pain, he had no way of incorporating those qualitative impressions into his epistemological scheme.

A second theme in Baumgarten's aesthetics is the requirement for thematic unity and order. The basis for order is the connection of impressions and images (1735: 62ff). The operative principle of connection is sufficient reason, and connections are themselves part of the observable order of indistinct representations. So despite his defence of the sensible realm, Baumgarten was still the disciple of Leibniz in holding that what gave order to sense data was a principle of reason which on Baumgarten's system was external to the data itself. He could forge a unity only by appealing to connections recognized by the mind but present between the sensate impressions. In spite of his desire to found a new science of aesthetics, Baumgarten could only appeal to a priori principles and try to find them reflected in his new aesthetic realm. He thus failed to resolve the tension between his rationalist epistemology and the new realm of science he had defined.

Bayle, Pierre (1647-1706)

Bayle was one of the most profound sceptical thinkers of all time. He was also a champion of religious toleration, and an important moral philosopher. The fundamental aim of his scepticism was to curb the pretensions of reason in order to make room for faith. Human reason, he believed, suffers from two fundamental weaknesses: it has a limited capacity to motivate our actions, and it is more a negative than a positive faculty, better at uncovering the defects of various philosophical positions than at justifying any one of them. This conception of reason led Bayle to see, with an uncommon clarity, that the nature of the sceptic's arguments must be to proceed by internal demolition, showing how claims to knowledge undermine themselves in their own terms.

Bayle's moral thought is to be found essentially in his critique of attempts (such as that of Malebranche) to show how God, all-powerful and good, could have created a world in which there is evil. Such theodicies, he argued, rely on unacceptable models of moral rationality. Bayle's arguments reveal a view of moral reasoning that is of considerable interest in its own right. Like Malebranche (and contrary to Leibniz, who attacked Bayle's critique of theodicy), he believed that there are duties superior to that of bringing about the most good overall. But unlike Malebranche, Bayle saw these duties as lying not in what the rational agent owes himself but in what he owes to the inviolable individuality of others. This outlook had its psychological roots, no doubt, in Bayle's own experience as a Huguenot victim of religious persecution.

1 Scepticism

Pierre Bayle was one of the most important sceptical thinkers of all time, as well as a notable moral philosopher and advocate of religious toleration. The fundamental motivation of his scepticism was religious: his aim was to curb the pretensions of reason in order to make room for faith. Born into a Calvinist family in Carla in southern France, he became a professor of philosophy in the Protestant academy at Sedan. After its abolition (1681) and the revocation of the Edict of Nantes (1685), which ended Protestant toleration in France, Bayle fled to Holland and spent the rest of his life in Rotterdam. His Calvinist conviction that God is rationally inscrutable spurred his wide-ranging attack on the power of reason to shape our conduct and to make sense of the world. As he wrote in the article on 'Paulicians' in his most important work, the *Dictionnaire historique et critique (Historical and Critical Dictionary)* (1696: Paulicians, note E), 'The ways of God are not our ways… [We must accept] the elevation of faith and the abasement of reason'.

Bayle believed that human reason suffers from two fundamental weaknesses. The first is that reason is quite limited in its capacity to motivate our actions. Human beings act more often in virtue of their dominant passions than on the basis of their professed principles. In his first important work, *Pensées diverses sur la comète (Miscellaneous reflections on the comet)* (1682), Bayle made use of this observation to argue that, contrary to the accepted opinion of his time, atheists would be able to live together peacefully in society. Were they to follow through on all the consequences of God's non-existence, they would indeed plunge into a life of vice without remorse. For though convinced that we can know the principles of morality without relying upon belief in God, Bayle thought that without such a belief we would have no reason to subordinate our self-interest to them. Still, the atheist would be unlikely to take up the life of crime, Bayle insisted, because the rational calculation of advantage is a less powerful motive than the concern for honour. The vanity of wishing to be well regarded by others, combined with an interest in using moral principles to blame or approve their actions (if not one's own), would steer the atheist toward mutual cooperation with others.

For Bayle, this argument was not merely a philosophical curiosity. It formed part of his continuing campaign in favour of a society based on religious toleration. The expression of heterodox opinion need not by itself imperil social order. The motivational weakness of reason played a further role in the central argument of Bayle's principal treatise on religious toleration, *Commentaire philosophique sur ces paroles de Jésus-Christ, 'Contrains-les d'entrer' (Philosophical Commentary on the Following Words of Jesus Christ, 'Compel Them to Enter')* (1686). Just as our actions stem less from our reason than from our passions and feelings, so belief itself, Bayle argues here, is not directly under our rational control, but arises involuntarily from inner conviction. As a result, the use of force to impose religious belief must be a futile enterprise. Individual conscience ought to be respected, since sincere belief can have no other source.

The second fundamental weakness of human reason for Bayle was that it is more a negative than a positive faculty. It lends itself better to the refutation of opposing views than to the justification of one's own position. As he wrote in *Réponse aux questions d'un provincial (Reply to the Questions of a Provincial)* (1703-7: II.137), reason 'is better able to demolish than to build, it knows better what things are not than what they are'. When reason is instead put to the use of defending some particular position, it tends naturally to undermine itself. Reason is essentially destructive because it excels in uncovering the self-contradiction into which its positive employment inevitably falls.

This diagnosis underlies two other significant features of Bayle's thought. It allowed him, first of all, to see clearly how sceptical argumentation must proceed in general. The sceptic may not appeal to principles that are not admitted by the position under attack, since such an argument would be irrelevant to the partisans of that position and contrary to the sceptic's own professed lack of knowledge. Instead, Bayle observed, the sceptic must show how the position undermines itself, involving views which are mutually inconsistent or conflicting with opinions every reasonable person holds. The sceptic must work by internal demolition, attacking his adversaries 'on their very own dungheap', as he wrote in the preface to his *Pensées diverses* (see also the 'Second Clarification' in 'Spinoza', *Dictionnaire historique et critique*).

The idea that in its positive employment reason is ultimately self-destructive also shaped Bayle's attitude towards the fundamental conflicts between reason and faith which he doggedly uncovered (see §3). 'If reason were in agreement with itself', he wrote (1703-7: II.137), 'we should be more worried that it agrees so poorly with some of our articles of religion'. Many of Bayle's Enlightenment readers (such as Diderot, in the article 'Pyrrhonian or Sceptic' of the *Encyclopédie*) claimed him for one of their own. But they were wrong to suppose that his attack on rational theology was aimed at the rejection of religious dogma. On the contrary, Bayle's scepticism took the form of a fideism, intended to confirm his Calvinist belief in the radical disparity between God's ways and our own. Indeed, so far was Bayle from being a founding father of the Enlightenment that he was one of the first to express concern about what in the twentieth century has come to be called 'the dialectic of the Enlightenment'. If we follow reason alone, proportioning all our beliefs to the available evidence, we will end up by doing away, he once wrote, not only with superstition and barbarism, but eventually with every sort of conviction: 'Man's fate is so bad that the knowledge that delivers him from one evil throws him into another' (1696: 'Takiddin' Note A).

2 Epistemology and metaphysics

In arguing against the capacity of human reason to acquire knowledge of the world, Bayle focused chiefly on foundational matters. We cannot demonstrate the real existence of the external world, he maintained, nor grasp its fundamental principles. But he appears to have had no serious doubt that straightforwardly empirical questions admit of rational solutions. Indeed, Bayle frequently urged, against the authority of Descartes, that philosophy should recognize the validity and importance of historical knowledge, and his own scholarship in the history of philosophy and theology was significant. Bayle's scepticism was therefore restricted to speculative questions of principle. In his *Dictionnaire* article on Pyrrho, he described Pyrrhonism simply as the view that we have no knowledge of the underlying nature of things (see Pyrrhonism).

Such an outlook would seem to place Bayle within the important seventeenth-century current of thought generally called 'mitigated scepticism', the most important exemplars of which were Gassendi and Locke. Like them he believed that, unlike our beliefs about the observable features of the world, ultimate physical explanations can be at most probable, never certain (1696: 'Pyrrho' Note B), and that such explanations refer to what we cannot fully understand. For example, he endorsed Locke's view that we know too little about the nature of matter to rule out the possibility that God might have 'superadded' to it the power of thought (1696: 'Dicaearchus' Note M) (see Locke, J. §5).

None the less, Bayle's scepticism ran deeper than that of Gassendi and Locke, for he also believed that ultimate physical principles turn out, upon reflection, to be self-contradictory. This was, for instance, the verdict of his famous discussion of space in the *Dictionnaire* article on Zeno of Elea (1696: 'Zeno' Note G). The idea of space, he argued, is incoherent on any of the interpretations one might give of it. Space cannot consist ultimately of mathematical points since the addition of extensionless entities to one another cannot produce extension. Nor can it consist of extended but indivisible physical points, since anything extended is divisible. Nor can it be infinitely divisible, since this would preclude the immediate contiguity of its parts, or would permit the interpenetration of

any two contiguous bodies, and in any case would succumb to the well-known paradoxes of the infinite. Here we find a perfect specimen of Bayle's theme that reason tends inevitably to undermine itself. His discussion of space had an important influence on Hume's *Treatise of Human Nature* (1739-41).

3 Theodicy and ethics: Bayle versus Malebranche

Bayle's moral thought is best approached by way of his critique of philosophical *theodicy*. That critique is important, if for no other reason than the fact that Leibniz took it as his main target in his 1710 *Essais de théodicée (Theodicy)*. But it also embodies a view of morality that is of genuine interest in its own right.

A theodicy aims to justify the ways of God to humans, showing how God, all-powerful and good, could have created a world in which there is evil. It must therefore make use of a model of moral rationality that lays out the principles according to which one should choose among actions, where each action may involve bad consequences. In this light, theodicies retain a philosophical value even for those who today may find very foreign the idea of justifying the ways of God. Theodicies give vivid expression to models of moral rationality. Accordingly, in seeing why Bayle thought the two leading theodicies of his day were morally unacceptable, we bring into focus his own very interesting conception of moral rationality.

The first of these theodicies was presented by Malebranche in his 1680 *Traité de la nature et de la grâce (Treatise on Nature and Grace)*. Malebranche's guiding principle was that God, in creating the world, had to show his wisdom and goodness not only in the result he achieved but also in the means he used. Consequently, God could act to maximize the resulting good in the world only to the extent that at the same time he employed a 'simplicity' of means - that is, a system of universal and immutable laws. As he could foresee, these laws would sometimes result in evil that could have been avoided, had he set about single-mindedly to bring about the greatest good possible. God knew, for example, of the evil that men would do because of the freedom he had given them, when they made use of the laws he set up. This evil, though foreseeable, was not intended, however, since God aimed only to respect his own nature as wise and good. The model of moral rationality that Malebranche assigned to God is therefore one we would call 'deontological': right conduct is that which respects certain principles independently of the bad consequences that the action can foreseeably produce (see Malebranche, N. §6).

In his first writings, Bayle presented himself as an adherent of Malebranche's theodicy. Thus, in the *Pensées diverses*, he sought to show that sensational phenomena such as comets and monsters, and even sin, represent neither a failure of providence nor God's particular will, but are instead the unintended result of the simple laws by which God rules the world (1682: §§208, 230, 231, 234). It is important to note that, like Malebranche, Bayle did not draw this model of moral rationality from revelation or scripture. We must judge God's rationality, he wrote, by reference to our own (1682: §223). He was convinced that the first principles of morals are open to our reason even 'without knowledge of God' (1682: §178).

This 'autonomy of morality' with respect to religion forms one of the constants of Bayle's thought. It is the principal basis on which later (beginning with the *Dictionnaire* in 1696) he rejected Malebranche's theodicy. He had come to believe that Malebranche's underlying model of moral rationality is incompatible with what we can see to be the first principles of morality. It is in precisely these terms that, in one of his last writings, he explained his change of mind (1703-7: II.91, 155). Bayle's fideism was therefore not the result of any wholesale scepticism about the possibility of knowledge in general. Indeed, as noted in §2 above, Bayle regularly limited his scepticism to speculative questions - he did not question our ability to acquire knowledge of more straightforward matters. And so, in the case of theodicy, he denied that we can ever justify the ways of God because, continuing to consider Malebranche's theory the best conception possible, he found that it conflicted with moral truths we know already.

What exactly did Bayle find morally unacceptable in Malebranche's theodicy? To Bayle it was evident that 'those who permit an evil which it is easy for them to prevent are culpable' and that 'those who let perish a person that they could easily save are guilty of his death'. How, then, could God have let the whole human race fall into crime and misery? He could easily have prevented the disobedience of Adam and Eve or at least have stopped the consequences of their fall. Malebranche's own response, of course, was that God let these things happen because the pursuit of the good must yield to respect for certain general principles. Bayle was not opposed to the idea that there exist duties superior to maximizing the good. But he insisted that such duties consist in securing an urgent good for the agent or someone other, or in saving them from a disastrous evil. These are not, however,

considerations which could have moved God in the present case. No other parties but himself and humanity were involved and since, being perfect, he himself had need of nothing, nothing could therefore weigh more heavily than his benevolence toward humanity, his creation (1703-7: II.91, 150, 155).

It could be said that underlying this difference between Malebranche and Bayle were not only two models of moral rationality but also two opposing conceptions of love. On the one hand, there is the idea of love as merited, according to which if one is perfect, one must love oneself above all; on the other hand, there is the idea of love as a gift, which implies that the more perfect one is, the fewer obstacles there must be to the love one bears others. Thus, just as Malebranche wrote that ‘one cannot love anything except in proportion to how much one believes it lovable’ (Malebranche [1715] 1974 XVI: 96), so Bayle affirmed that ‘nothing fits better with true grandeur and supreme perfection than to put one’s power and knowledge in the service of others’ happiness’ ([1707] 1964-8 IV: 63).

In response to Bayle’s objection one could imagine Malebranche, like many deontologists, invoking the classic principle of ‘double effect’, according to which actions are to be judged morally by their intended effects, not by all their foreseeable effects. Is it not true that Adam and Eve were themselves free to prevent the evil, that the responsibility for it was their own, and that it was a paramount duty to respect their freedom of action, even at the price of not doing what one knew would produce the greatest good? Indeed, in a letter of 11 December 1706 to the Père André, Malebranche formally embraced the principle of double effect. But Bayle anticipated this reply, claiming that it is an evident principle that one ought not to give someone a good (such as freedom of action) that one knows the person will abuse (1703-7: II.81).

In the *Dictionnaire* Bayle presents a remarkable example to illustrate this point (1696: ‘Paulicians’ Remark E). A mother who sent her daughters to a ball knowing that they would succumb to temptation, but being content simply to encourage them to be virtuous and to threaten to disown them if they did not return home virgins, would not count, he observed, as loving either her daughters or chastity. Bayle did recognize duties of ‘strict obligation’, involving respect for the freedom of others which ordinarily take precedence over the maximization of the good. But he believed that such duties must be suspended in emergency cases, where a catastrophic evil is to be avoided (1696: ‘Paulicians’ Remark M). There, we must choose the lesser evil (See Malebranche, N. §§4-5).

4 Bayle and Leibniz

Bayle’s critique of Malebranche might suggest that he held a ‘consequentialist’ conception of moral rationality, according to which we should always seek the greatest net good overall, even at the price of using means that in themselves are bad. This conception underlies, in fact, the theodicy which Leibniz laid out in the *Essais de théodicée*. There he argued that God reasons according to the ‘règle du meilleur’ (‘the rule of the better’), so that what is evil in itself should be chosen if it forms the indispensable means to bringing about the greatest good overall (Leibniz 1710: §§22, 209). The general and immutable laws according to which God created the world constitute not limits (as Malebranche believed) but, rather, means to the maximization of the good.

Leibniz directed the *Essais* primarily against Bayle himself and his claim that theodicy is impossible. In his view, Bayle had sold theodicy short by failing to consider a version which makes rigorous use of ‘la règle du meilleur’. Leibniz’s position seems to look all the stronger if Bayle’s arguments against Malebranche are themselves consequentialist in spirit. However, the argumentative situation is more complex. Bayle’s conception of morality was not really consequentialist. And though Bayle died four years before the publication of Leibniz’s book, he was familiar with a theodicy of that form and rejected it as morally unacceptable (see Leibniz, G.W. §3).

The consequentialist theodicy with which Bayle was acquainted was one outlined by Isaac Jaquelot in his 1705 book, *La conformité de la raison et de la foi (The Conformity of Reason and Faith)*. Jaquelot himself rather closely followed the Malebranchian position. But he claimed that Bayle’s objections to Malebranche relied on the principle that one ought always to do that action which will bring about the most good overall. Suppose, he wrote (treating the question of theodicy once again through the story about the mother and her daughters), the mother was sending her daughters to the ball so that, in virtue of all the foreseeable consequences of that decision, a ‘great, noble, and comprehensive plan’ for the reformation of the kingdom would be realized. If Bayle required that the welfare of the daughters should count for more than the duty of respecting their freedom, he ought also to admit, so Jaquelot argued, that the still greater good of accomplishing that plan should outweigh their welfare.

They ought to be sent to the ball. God's decision not to prevent Adam and Eve's disobedience would thus be justified on the same basis - namely, by the greater good which his overall plan of eventual redemption would bring about.

Bayle took up Jaquelot's challenge in his *Réponse aux questions d'un provincial* (1703-7: II.153). Such a mother, he replied, would be even more wicked than the one first imagined. Agreeing that, taken absolutely, the good of the kingdom is greater than the good of the daughters, Bayle maintained that there are some things we should never do to another person, even at the cost of foregoing a tremendous good. This rejoinder to Jaquelot was, no doubt, the objection Bayle would have made to Leibniz had he lived to see Leibniz's *Essais de théodicée*. Once again we find him rejecting a theodicy on the basis of moral principles which he claims we know to be true.

An important question, however, is whether Bayle's moral thought, taken as a whole, is coherent. How can we harmonize his criticism of Malebranche, according to which the prevention of a significant evil must weigh more than the duties of strict obligation, with his objection to Jaquelot (and by anticipation to Leibniz) that the maximization of the good must yield to certain prohibitions on the treatment of others? How, we might say, can Bayle apparently reject both deontological and consequentialist conceptions of moral reasoning? In fact, Bayle was perfectly consistent. In his rejection of Malebranche, the operative principle was that we may suspend a strict duty with regard to an individual if we wish to avoid a very great evil to *this same individual*. Such a principle is clearly compatible with the principle Bayle invoked in his response to Jaquelot, namely that we must never cause a great evil to an individual in order to procure a great good *for others*.

Bayle was no doubt a deontological thinker, since he believed that there are duties superior to that of bringing about the most good overall. The fundamental coherence of Bayle's thought emerges once we recognize that a deontological ethic can take two different forms. Malebranche's version limits the maximization of the good by the demands of what a rational agent owes himself. Bayle's version limits it by the demands of what one owes to the inviolable individuality of others. The core conviction of Bayle's ethics was the refusal to sacrifice individuals to a greater whole. No doubt, it had its psychological roots in his own experience as a Huguenot refugee from religious persecution. Bayle's skill in giving it philosophical articulation shows him to be, despite his scepticism, one of the great moral thinkers.

Beattie, James (1735-1803)

James Beattie was famed as a moralist and poet in the late eighteenth century, and helped to popularize Scottish common-sense philosophy. At Marischal College, Aberdeen, Beattie cultivated a lecturing style which differed significantly from that of his Aberdonian predecessors. Because he believed that the form of abstract analysis characteristic of the science of the mind in his day often led students into the morass of Humean scepticism, Beattie endeavoured to inculcate sound moral and religious principles through the study of ancient and modern literature. Consequently his version of common-sense philosophy diverged from that developed by Thomas Reid. Beattie was more of a practical moralist than an anatomist of the mind, and his treatment of common-sense epistemology lacked the philosophical range and rigour of Reid's.

1 Life

Equally renowned in his day as a poet, the moralist James Beattie was born on 25 October 1735 in Laurencekirk, Scotland. He attended Marischal College, Aberdeen, from 1749 to 1753, when he took his M.A. Beattie shone as a student, and was a favourite of the principal of the college, the noted classicist Thomas Blackwell. After graduating, Beattie became a parish schoolmaster in the village of Fordoun near his home, and he also began to work towards a divinity degree. While at Fordoun, Beattie published occasional poems in the periodical press, and he later consolidated his literary reputation with *The Minstrel* (1771-4). Thanks to the influence of Blackwell and his colleagues, Beattie was appointed to teach at the Aberdeen Grammar School in 1758, and succeeded Alexander Gerard to the Chair of Moral Philosophy and Logic at Marischal in 1760.

Once installed as professor, Beattie became a prominent figure in the Aberdeen Philosophical Society (to which he was admitted on 10 February 1761) and the Aberdeen Musical Society. Because of his poetical works Beattie was also increasingly known outside of Aberdeen, and became the darling of the London literati in the early 1770s when he published *The Minstrel* along with his widely read attack on David Hume, *An Essay on the Nature and Immutability of Truth* (1770). For his part, Hume thought the *Essay* a splenetic performance, and his sentiments were echoed by Beattie's most combative critic, Joseph Priestley. However, the work was applauded by George III and, during a highly successful visit to London, Beattie was rewarded with a royal pension and given an honorary Doctor of Laws degree by Oxford University on 9 July 1773. Among the many friends he made on this trip was the painter Sir Joshua Reynolds, and while he was in the metropolis he sat for the allegorical portrait 'The Triumph of Truth', in which Beattie is juxtaposed with the figure of truth victorious over her opponents. On the Continent Beattie was similarly applauded as a champion of orthodoxy. In 1774 he was elected to the Zealand Society of Arts and Sciences in Holland, and the enthusiastic reception of the *Essay* prompted translations into Dutch, French, German and Italian.

The early 1770s can be seen as marking the high point of Beattie's career. Yet the promise of this period was never completely fulfilled, largely because his already fragile health declined markedly and his wife gradually became mentally unstable. Capitalizing on the popularity of the *Essay*, in 1773 he solicited subscriptions for a new edition which would include additional essays on other topics, and, after delays caused by illness, he saw this enlarged version through the press in 1776. Eventually his deterioriating condition and that of his wife forced him to abandon any hope of completing a systematic work on moral philosophy. He turned instead to revising segments of his lectures in the winter of 1780-1, and these eventually appeared in 1783 as his *Dissertations Moral and Critical*. The following year Beattie found some consolation in further public recognition, for he was appointed a fellow of the newly founded Royal Society of Edinburgh and elected an honorary member of both the Manchester Literary and Philosophical Society and the American Philosophical Society.

Beattie finally realized his long-standing ambition to publish an accessible defence of Christianity in 1786 when he completed his *Evidences of the Christian Religion*, modelled on an earlier apologetic work by Joseph Addison, whom he greatly admired. Like many of his previous writings the *Evidences* had its origins in the classroom, and he recycled his lectures one last time as the basis for *The Elements of Moral Science* (1790-3). The subsequent popularity of the *Elements* as a textbook attests to Beattie's standing as a pedagogue, but his ill health had somewhat compromised his teaching career. One of his major preoccupations during the 1780s was to find a suitable successor, and in 1787 his Marischal colleagues agreed to nominate his son, James Hay Beattie, as joint

professor. However, his son died tragically in 1790, and the issue of succession was not settled until 1796, when George Glennie's appointment as his assistant enabled him to retire from lecturing.

2 Professing moral philosophy

Prior to Beattie's election to the chair, the teaching of moral philosophy at Marischal College can be seen as a volatile mixture of moral exhortation with the rigorous study of the intellectual and active powers of the mind. George Turnbull was the first pedagogue at Marischal to argue that the lessons of practical morality must be rooted in the empirical investigation of human nature, and his call for a methodological reform in the science of morals was taken up at the college by David Fordyce and Alexander Gerard. Beattie, however, broke with this tradition. When he began lecturing in 1760, his course was virtually the same as that given by his teacher Gerard, but during the next two decades Beattie reoriented the moral philosophy curriculum. Whereas Gerard surveyed the various faculties of the mind in a comprehensive manner, over the years Beattie reduced the number of classes spent on pneumatology to make room for lectures on literary criticism, as well as greatly expanded treatments of language, rhetoric, composition and the writings of Cicero. Along with this literary turn went an increased interest in dreaming, taste and the workings of the imagination and memory; Beattie evidently valued his lectures on these topics in so far as he revised them for inclusion in his *Dissertations Moral and Critical* (1783). Beattie also enlarged the time spent on natural theology and, in the 1770s, his discussion of the rational grounds for Christianity took on a new polemical tone due to his growing obsession with the supposed threat posed by the fashionable scepticism of Hume.

Moreover, Beattie was more emphatic about the prerogatives of practical moralizing than Gerard had been. Whereas Gerard had espoused the view that the pursuit of virtue had to be based on a knowledge of the first principles of morality, Beattie virtually severed the connection between theory and practice by arguing that matters of conduct took priority over metaphysics (by which he meant the abstract study of the mind). Consequently, he eschewed any detailed discussion of the substantive issues debated in the science of the mind as being of little concrete application, and focused instead on the inculcation of sound moral, religious and political attitudes. Indeed, he explicitly warned his students against being seduced by purely speculative metaphysical problems, and urged them to attend to the fulfilment of their various practical duties. Beattie thus endeavoured to disentangle the role of the metaphysician from that of the practical moralist, and in so doing distanced himself from the style of philosophizing cultivated by most of his Scottish contemporaries.

Beattie's change of direction was largely prompted by his animus against David Hume. In Beattie's view, Scottish academic philosophy was far too preoccupied with the epistemological issues raised by Humean scepticism and had lost sight of the primacy of moral preaching. Fearing the dominance of Hume's supposed 'party' of sceptics in Edinburgh, he turned south of the border for inspiration, and cultivated both the teaching practices and the form of polite culture which he associated with the ancient English universities.

3 Beattie, Reid and common-sense philosophy

Joseph Priestley was the first to bracket together the works of Beattie and Thomas Reid in his critique of common-sense philosophy, and most commentators have subsequently followed his lead. Priestley's elision of their writings, however, conceals as much as it reveals. Beattie was introduced to the elements of common-sense epistemology by Gerard, and this largely accounts for the differences between his exposition of the notion of common-sense and that found in the works of Reid. Moreover, Beattie himself lamented Reid's generous public treatment of Hume, which for him showed that Reid was too much of a metaphysician and lacked warmth in the cause of virtue. Beattie's dislike of metaphysics also accounts for the fact that, unlike Reid, he did not engage in a systematic refutation of the theory of ideas as it had evolved in the works of Descartes, Locke, Berkeley and Hume. Given that Reid's painstaking analysis of the mechanisms of human perception was the cornerstone of his response to scepticism, Beattie's lack of interest in this topic serves to underline the contrasts between them. Beattie was much more of a moral preacher and polemicist than Reid, and their divergent styles suggest that Beattie's place in the development of Scottish common-sense philosophy requires reassessment (see Common Sense School).

List of works

Much of Beattie's unpublished correspondence, along with related manuscripts and student lecture notes, is held in Aberdeen University Library. Other important archival materials are to be found in the Scottish Record Office and Edinburgh University Library.

Beattie, J. (1996) *The Collected Works of James Beattie*, ed. R. Robinson, London: Routledge; Bristol: Thoemmes Press, 10 vols.(Facsimile reprints of all of Beattie's works, plus hitherto uncollected miscellaneous writings and manuscript materials, along with Forbes' biography (1806).)

(1760) *Original Poems and Translations*, London: Millar.(A collection of Beattie's earliest poems and translations of selections from Anacreon, Horace, Lucretius, and Virgil.)

(1770) *An Essay on the Nature and Immutability of Truth, in Opposition to Sophistry and Scepticism*, Edinburgh: Kincaid & Bell; London: Dilly; repr., intro. F.O. Wolf, Stuttgart-Bad Cannstatt: Frommann, 1973.(Established Beattie's reputation as a moralist, and popularized common-sense philosophy.)

(1771-4) *The Minstrel: or, the Progress of Genius*, London: Dilly; Edinburgh: Kincaid & Bell.(Rooted in debates over the nature of poetry, *The Minstrel* consolidated Beattie's standing as a writer.)

(1776) *Essays*, Edinburgh: Creech; repr. New York: Garland Press, 1971; Hildesheim: Olms, 1974.(An expanded text of the *Essay*, plus essays on our psychological response to poetry and music, humour, and the usefulness of classical learning.)

(1783) *Dissertations Moral and Critical*, London: Strahan & Cadell; repr. New York: Garland Press, 1971; Hildesheim: Olms, 1974.(Six lengthy essays on philosophical, psychological, linguistic, moral, aesthetic, and literary topics derived from his lectures.)

(1786) *Evidences of the Christian Religion, Briefly and Plainly Stated*, Edinburgh: Creech; London: Strahan & Cadell, 2 vols.(Popular exposition of the rational case for the truth of Christianity.

(1790-3) *The Elements of Moral Science*, London: Cadell; Edinburgh: Creech, 2 vols; repr. Hildesheim: Olms, 1974.(Influental textbook comprised of revised versions of Beattie's lectures on psychology, natural theology, ethics, economics, politics and logic.)

(1820) *The Letters of James Beattie, LL.D. Chronologically Arranged from Sir W. Forbes's Collection*, London: Sharpe, 2 vols.(The largest published collection of Beattie's letters.)

(1908) *James Beattie 'The Minstrel': Some Unpublished Letters*, ed. A. Mackie, Aberdeen: Aberdeen Daily Journal Office.(Twenty-five letters of primarily biographical interest.)

(1946) *James Beattie's London Diary 1773*, ed. R.S. Walker, Aberdeen: Aberdeen University Press.(Beattie's detailed chronicle of his extended trip to London in the summer of 1773.)

(1948) *James Beattie's Day Book 1773-1798*, ed. R.S. Walker, Aberdeen: The Third Spalding Club.(A selection from Beattie's personal accounts which sheds light on his dealings with his publishers and a number of other topics.)

Beauty

On the subject of beauty, theorists generally agree only on rudimentary points about the term: that it commends on aesthetic grounds, has absolute and comparative forms, and so forth. Beyond this, dispute prevails. Realists hold that judgments of beauty ascribe to their subjects either a nonrelational property inherent in things or a capacity of things to affect respondents in a way that preserves objectivity. In both cases acute problems arise in defining the property and in explaining how it can be known. Classical Platonism holds that beauty exists as an ideal supersensible Form, while eighteenth-century theorists view it as a quasi-sensory property. Kant's transcendental philosophy anchors the experience of beauty to the basic requirements of cognition, conferring on it 'subjective universality and necessity'. Sceptics complain that the alleged property is merely a reflection of aesthetic pleasure and hence lacks objective standing. Partly due to its preoccupation with weightier matters, the philosophic tradition has never developed any theory of beauty as fully and deeply as it has, say, theories in the domain of morality. Comparative neglect of the subject has been encouraged by the generally subjectivistic and relativistic bent of the social sciences and humanities, as well as by avant-gardism in the arts. However, several recent and ambitious studies have given new impetus to theorizing about beauty.

1 Areas of general agreement about beauty

Almost all theorists concerned with the concept of beauty accept the following propositions. The reflective use of terms of beauty standardly expresses not a mere effusion but a favourable aesthetic judgment of a thing as a whole or in part. The commendation is normally associated with the capacity of the thing to yield pleasure, and presupposes a basis of beauty-making properties, on which beauty is said to supervene. The commendation is relative to (a) a threshold which varies widely with speakers, below which lie grades of lesser aesthetic value without a determinable minimum and above which rise grades of eminence also without a fixed limit, and (b) a comparison-class, which in different contexts ranges from the highly restricted ('a beautiful daisy') to the virtually universal ('a beautiful thing'), or a grade of competition ('a beautiful drawing for a beginner'). It seems we need go only a small step beyond these truisms to conclude that all normative disagreements about beauty reduce to differences of comparative rankings (more, less, or equally beautiful or unbeautiful) and that differences regarding threshold or terminology have no theoretical importance. Beyond these elements of the 'logic' of beauty, there is scant agreement.

2 Specimen issues concerning beauty

Perhaps the most fundamental issue is whether beauty exists in any substantial sense. The common saying that beauty is in the eye of the beholder, taken straightforwardly, amounts to a denial that beauty is a property of anything or that anything is genuinely worthy of being aesthetically admired. This denial is a first principle of aesthetic subjectivism (or nihilism), which, if consistent, confines its theorizing to the analysis of aesthetic preference as a socio-psychological phenomenon and as a variably rational or nonrational part of life. Generally, subjectivists in aesthetics, like those in ethics, retain the usual value terms but reinterpret them as avowing, expressing or soliciting preferences. In contrast, aesthetic realists seek to identify the property or state of affairs that beauty consists in and to explain how it can be known.

Many issues are common to aesthetic realism and subjectivism. For instance: (1) What is the range of things to which terms of beauty can be meaningfully applied? Some take beauty to be a transcendental, in the medieval sense of being a category that is applicable to everything. Others deny that it applies to certain classes. Flavours, scents, bodily sensations, thoughts, theories, abstractions, virtues and even natural objects are excluded by one thinker or another. Some allege that the proper referent of terms of beauty is never a physical object but an appearance or 'semblance'. (2) To what extent can aesthetic value be subsumed under the beautiful? Are the sublime, the pretty, the cute, the witty and the tragic species or degree-ranges of beauty, or are they distinct values? (3) To what extent may things of different types be meaningfully compared in respect of beauty? Parrots of a given species may be judged beautiful relative to one other, but can they be ranked against horses or houses? If not, can the beautiful be a single category of appraisal? (4) How determinate can judgments of beauty be when many factors enter into the case? On the face of it we stand on firmer ground in judging that a musical work is beautifully tender or sprightly than when we pass a summative judgment on the total ensemble of its qualities. This

has an obvious impact on comparisons: Beethoven's Fifth and Sixth symphonies are replete with beautiful aspects and moments, but can we sum these so exactly as to say which work is more beautiful?

3 Beauty as an intrinsic property

The simplest form of realism about beauty takes it to be an intrinsic or nonrelational property with strong *de facto* and *de jure* ties to love. For Plato and Plotinus it is a supersensible abstract Form, better exemplified by abstractions than by concrete particulars, and supremely exemplified by itself. Acquaintance with beauty begins in commerce with particulars, but only pure thought, on the model of mathematical and moral intuition and demonstration, can elevate the opinions gained through acquaintance to the level of knowledge. Though their theoretical framework does not by itself entail particular normative principles, Platonically-minded thinkers usually favour Apollonian values of order, clarity, harmony and balance as opposed to Dionysian values of profusion, sensuality and vehemence.

A basic question left unanswered by theories of this type concerns the nature of the property of beauty. Neither Plato nor Plotinus offer to identify the property of beauty, and in their writings it tends to acquire a mystical air, due to the obscure nature of its purer exemplars (the Forms) and the extreme breadth of its range. The latter makes it difficult to imagine how any nonrelational property could account for all the indicated sorts of beauty, and the difficulty is compounded by suggestions of a single, universal rank-ordering. Answers to such questions are hampered by the vagueness of theorists' accounts of the relation between properties and their instances, which is especially acute if one takes literally Plato's claim that the property of beauty is supremely self-exemplifying. Platonic ontology aside, citations of primary values such as the medieval triad of clarity, splendour and proportionality invariably omit to supply a working criterion of any of the three, or a summation rule to decide between things which differ in more than one of them.

4 Response-related realist conceptions of beauty

A second sort of realism takes beauty to be essentially related to human response. The manner of relatedness varies. For example, G.E. Moore's definition of beauty as 'that of which the admiring contemplation is good in itself' avoids any reference to actual effects on human feeling. It speaks only of effects which, should they occur, would contribute to the intrinsic value of a state of mind. This allows things to be beautiful even if they are never experienced, or if experienced never admiringly contemplated. At the same time it ties beauty conceptually to human experience. At first sight such a theory has no difficulty explaining the diversity of beautiful things, for why should not endlessly diverse constellations of material and mental properties be intrinsically good to contemplate admiringly? But doubts arise when one asks how to determine which ones qualify. Obviously it will not do to answer, 'the beautiful ones'. And in the end the answer seems irretrievably buried in the nature of intrinsic goodness, since on Moore's view that property is not only simple and therefore unanalysable, but non-natural and consequently inaccessible to empirical observation. One must reach such results as one can by an intuition which, if rational, is inexplicably so.

British eighteenth-century theorists (Hutcheson and Hume, for example) advanced a naturalistic conception of beauty as a relational property, sufficiently similar to a sensory colour or sound to be known by a faculty called the sense of beauty. The sense is internal, in that it responds directly to mental representations, not to external stimuli. A considerably sanitized and amplified development of the central idea might go as follows. The surface colour of a red object is definable as a power (now more commonly called a disposition) to excite a red appearance in optimally colour-sighted percipients under optimal conditions; likewise the beauty of a sensible object is its power to produce, via impressions of the external senses, a beauty-datum (an 'idea' of beauty, in eighteenth-century parlance) in optimally beauty-receptive observers under optimal conditions. (Deviations are explained by non-optimality affecting some part of the sensory process.) The beauty-datum of choice is disinterested pleasure, defined (for instance, by Shaftesbury) as pleasure taken wholly in the object and not at all in the self, or more exactly not in the self's pleasure. Since disinterested pleasure is arguably also a mark of moral discernment (sometimes ascribed to a companion moral sense), an additional qualification is required if beauty is not to be identified with the moral good. (See the proposal by Kant, below.) To cover things of abstract beauty, the theory must assume that the sense also yields a beauty-datum in response to the mental representation of theorems, proofs and so forth, under appropriate conditions of optimality.

Discussions of erroneous judgments of beauty occur in the works of all the major British theorists, Hume's perhaps being most often cited. Pooling the suggestions therein, one might obtain an honestly empirical criterion of accuracy of the sense of beauty by requiring a consensus among maximal beauty-discriminators under optimal beauty-discriminating conditions. Failing that, beauty would not exist. To complete the analogy with sensory properties, the consensus would also have to correlate with a basis in the object comparable to wavelengths, reflectance and the like for sensory properties. Uniformity and variety 'in compound ratio' is Hutcheson's all-purpose candidate for this role. An appropriate brain structure for the sense must also be assumed. None of the theorists acknowledges the full set of necessary components or the theoretical and practical difficulties of establishing that all of them actually exist.

Immanuel Kant's theory of beauty introduces important new ideas, though in such a way as to provoke endless controversy over their precise content and validity (see Kant, I. §12). Aesthetic pleasure is distinguished from its moral counterpart by its freedom from concern with the actual existence or nonexistence of the object of pleasure. Kant circumvents the need to rely on actual agreement among qualified judges by an ingenious but cryptic account of the deep source of pleasure. This is, he says, the harmonious free play of the cognitive powers, the imagination and understanding - free in the sense of not being directed towards actual knowledge. In ordinary cognition the imagination supplements the received sensory data so as to fit them to a concept supplied by the understanding. The result is an objective judgment. In aesthetic contemplation the imagination is free to seek out relations of form without concern for cognitive relevance to the scene which contains them; and the understanding is free to accept the yield and set new pattern-finding tasks for the imagination. Since the routines of this play are indispensable staples of ordinary cognitive processing, they belong to the repertoire of all humans beings, and the pleasurable harmony of the faculties can be presumed universal and necessary - a pleasure we have a right to expect everyone to feel. Because the play is not controlled by definite concepts, the judgment of free beauty is irremediably singular and incapable of being generalized into a rule of beauty.

Kant also recognizes judgments of 'dependent' beauty, where a concept imposes a limitation. For example, to judge the beauty of a human body, one must take account of whether the properties of the body (for example, its proportions) are such as to facilitate the functions of a human being. Only such free beauty as fulfills this condition affects the overall assessment. Though less purely aesthetic than free beauty, dependent beauty is of far greater human significance. Artistic beauty falls under this head, since all art is to some extent constrained by a purpose.

5 Restoration of beauty as a theoretical subject

Twentieth-century philosophies of beauty are comparatively rare, due to a general shift of interest towards the aesthetic. An exception to the rule is a searching, broad-gauge theory by Guy Sircello, which construes virtually all aesthetic values as species of beauty and explains beauty in terms of non-defective and non-defective-seeming 'properties of qualitative degree'. As these properties are highly context-dependent both for their existence and for their status as non-defective and non-defective-seeming, it is hard to be sure of their ontological or, to an extent, their epistemological standing. Moreover, Sircello does not hazard a sufficient condition for the overall beauty of things as opposed to their beauty in respect of a property of the sort mentioned. Another effort was made to revive the theory of beauty by Mary Mothersill, after reflection on Kant's aesthetics, and especially on his dictum that there can be no laws of taste. On her view 'Any individual is beautiful if and only if it is such as to be a cause of pleasure in virtue of its aesthetic properties'. The latter are understood in a new way, namely as properties so sensitive to their context as to be incapable of being possessed by two individuals unless the latter are perceptually indistinguishable under standard conditions of observation. For example, the distinctive wavelike contour running throughEl Greco's *Burial of Count Orgaz*, when taken in the full context provided by the painting, is qualified by the totality of perceptible relationships between it and all other features of the design. In this way she supportsKant's idea of the judgment of beauty being logically singular, since such radically contextualized properties cannot figure in non-trivial laws or principles. Mothersill's theory, developed with skill and panache, raises daunting problems but, likeSircello's, opens up possibly profitable lines of research.

6 Subjectivism and relativism regarding beauty

Subjectivist theories of beauty, while relieved of the commitment to the identity and 'knowability' of beauty, raise important problems involving the rationality of aesthetic preference. If a judgment of beauty, taken as avowing or expressing an aesthetic pro-attitude, can be counted unjustified if based on error or ignorance regarding its object,

then aesthetic subjectivism can impute fault without implying that beauty is a property of anything. Is it amenable to principles of rationality beyond that point? Can it justify favouring consistency in aesthetic attitudes over time or the subsumption of particular attitudes under attitudes of wide scope? If people generally concur in an error-free aesthetic attitude regarding a thing, does that fact give one a reason for suspicion about one's own dissenting but equally error-free attitude?

Relativism holds that beauty varies with cultures or 'taste-publics' without collapsing into personal preference. A version close to the dispositional account in §4 could be obtained by relativizing the beauty-disposition to the maximal discrimination-capacities attainable in distinct cultures, especially if some neural explanation of the difference could be found - following the analogy of sensory colour, which is vulnerable to the same relativization if different cultures are found to have different but equally acute colour-sensibilities. Typically, however, relativists tend towards a notion of aesthetic taste so malleable as to leave no chance of a quasi-realist account - without, it must be observed, offering anything like compelling evidence. An alternative explanation of cultural difference as a specialization-phenomenon is at least as plausible. On this (realist) view, cultures develop special competences in distinct ranges of beauty, without there being any incompatibility among the values most reliably assessed by the respective cultures.

Beauvoir, Simone de (1908-86)

Simone de Beauvoir, a French novelist and philosopher belonging to the existentialist-phenomenological tradition, elaborated an anthropology and ethics inspired by Kierkegaard, Husserl, Heidegger and Sartre in Pyrrhus et Cinéas (1944) and Pour une morale de l'ambiguïté (The Ethics of Ambiguity) (1947). In her comprehensive study of the situation of women, Le deuxième sexe (The Second Sex) (1949), this anthropology and ethics was developed and combined with a philosophy of history inspired by Hegel and Marx. The most prominent feature of Beauvoir's philosophy is its ethical orientation, together with an analysis of the subordination of women. Her concept of woman as the Other is central to twentieth-century feminist theory.

1 Life

Simone de Beauvoir was born on 9 January 1908 in Paris and lived there almost all her life. Her parents belonged to the bourgeoisie and provided her with a traditional Catholic education. After studies at the Sorbonne, Beauvoir took an *agrégation* in philosophy in 1929 (that is, a higher teaching exam) at the prestigious École Normale Supérieure. There she met Jean-Paul Sartre, with whom she entered a lifelong bond of intellectual companionship. They never married, nor had any children, but stayed together in a free liaison, allowing intimate relations with others.

In the 1930s, they both studied the phenomenology of Husserl and Heidegger, and the existential philosophy of Kierkegaard. During and after the war, Beauvoir developed an interest in Hegel and Marx, especially in the philosophy of the young Marx. In 1945 Beauvoir, Sartre and Maurice Merleau-Ponty founded *Les Temps Modernes*, a literary, philosophical and political journal. The same year, Sartre and Beauvoir became known as 'existentialists', a label they reluctantly accepted. Both became leading intellectuals of their generation, politically engaged but non-affiliated leftists. Beauvoir, for her part, also inspired and participated in the feminist movement of the 1970s and 1980s.

Generally, Beauvoir is better known as a novelist than as a philosopher. Still, during the 1940s she produced a number of philosophical essays, the most important being *Pyrrhus et Cinéas* (1944) and *Pour une morale de l'ambiguïté (The Ethics of Ambiguity)* (1947). This was followed by *Le deuxième sexe (The Second Sex)* (1949), labelled one of the most influential books of the twentieth century; its underlying philosophical structure reveals her thought in its mature phase. Novels like *L'Invitée (She Came to Stay)* (1943) and *Tous les hommes sont mortels (All Men are Mortal)* (1946), are also organized around philosophical questions.

2 *The Ethics of Ambiguity*

In *Pyrrhus et Cinéas*, Beauvoir, like Kierkegaard and Sartre, defines the human being as an existent that, lacking an inherent essence, has to form its life and give it meaning. This ethos is repeated in *The Ethics of Ambiguity*, where Beauvoir radically transforms Sartre's view of the human being as a 'useless passion'. According to Sartre, the human is characterized by both the lack of being and an unrealizable passion, the 'desire of being' (*désir d'être*), that is, to attain a fixed identity or essence. Beauvoir adds to this the Heideggerian notion of *Erschlossenheit* (disclosure; in French, *dévoilement*), therewith pointing also to the positive side of existence. According to her, the human being not only lacks and desires being, but also wants to 'disclose being'. Or, through the human's vain desire, the world is disclosed, that is, appears and is given meaning.

Affirmation of this positive side of existence is identified with authenticity: to 'deny the lack as lack', to go through a 'conversion', is to set the 'will to be "in parentheses"'; and further, a recognition of both oneself and the other as free - 'to will man free… is to will the disclosure of being in the joy of existence' ([1947] 1948: 135). Beauvoir thus affirms freedom as a fundamental human characteristic. At the same time she is careful to distinguish the freedom of human consiousness - a free spontaneity, a nothingness without given structures - from freedom as a social and political reality. Central to her ethics is the idea that freedom ought to be founded and defended by the individual. On the other hand, society has to facilitate conditions for the positive fulfilment of this freedom. There are thus objective differences between situations, a theme which is further developed in *The Second Sex* by the aid of such Hegelian-Marxist distinctions as that between 'abstract' and 'concrete' freedom and between 'positive' and 'negative' freedom.

Another central theme introduced in *Pyrrhus et Cinéas* and developed in *The Ethics of Ambiguity* concerns the interdependence of humans. In the latter work she states, 'The me-others relationship is as indissoluble as the subject-object relationship' ([1947] 1948: 72). In *The Second Sex* this interdependence is conceptualized in Heideggerian terms as *Mitsein* (Being-with). Human reality is a being-with-others, and the subject 'achieves freedom only through a continual reaching out towards other freedoms' ([1949] 1953: 27), a theme which points to the ethical orientation of her thought. Unlike Sartre in *Being and Nothingness*, Beauvoir does not see conflict as inevitable, nor intersubjectivity as impossible (see Existentialism; Existentialist ethics).

3 *The Second Sex*

If a prominent feature of Simone de Beauvoir's philosophy is its ethical orientation, another is the analysis of oppression. In *The Second Sex*, the existential anthropology and ethics is transformed under the influence of Hegel and Marx, to be combined with a philosophy of history. Consequently, consciousness is conceptualized as historically mediated and human beings as socially situated. Beauvoir declares, with Merleau-Ponty, that 'man… is a historical idea'. Following Hegel and Kojève, she understands the origins of humanity as characterized by a struggle for recognition between men, which led to the genesis of inequalities and oppression. This Hegelian master-slave dialectic is combined with a Marxist insistence on the importance of productive activity, or work, as key to the development of both the human being and society. Since women, owing to their reproductive function and their lesser physical strength, stood outside both the struggle for recognition and productive activity, and therefore outside the basic dialectic, they were defined by the males as the absolute Other (*l'Autre*). They were cast in the role of the object that never became the subject in relation to men, a situation that with the advent of private property and the state became institutionalized into patriarchal society.

The concept of woman as the Other is probably Beauvoir's most important contribution to philosophy and feminist theory. Accepting the existentialist credo 'essence does not precede existence', Beauvoir rejects any idea of an inherent femininity and asserts 'One is not born, but rather becomes, a woman' ([1949] 1953: 273). Gender is therefore conceptualized as simultaneously socially produced and self-created within the confines of the socio-historical situation. Beauvoir emphasizes that because women have historically been the subordinate sex, the Other from the dominant male point of view, they have also been defined as having a determinate nature, be it evil or good. Women have thus not been seen as subjects in their own right, something which Beauvoir criticizes as inauthentic.

The subordination of women is explained in *The Second Sex* not only as a social and historical phenomenon, but also from an existentialist perspective. If the 'desire of being', in Sartrean terms, is equated with an inauthentic flight from freedom and responsibility, it is equally for Beauvoir an explanation of oppression and submission. Man has sought to fulfil his desire by taking possession of a woman; yet the attempt is as ever vain, and ends only in the man's alienation of himself in the woman. Similarly, woman has tried to fulfil her desire by alienating herself in man as if he were an absolute subject and could take responsibility for her life. The existentialist 'desire of being' is combined in *The Second Sex* with a concept of alienation, influenced by that of the young Marx. This implies a distinction between alienation, which is synonymous with a search for being through the other, or through what one has, and authentic self-fulfilment through objectifying oneself in what one does, through conscious, freely chosen, object-creating activity. This authentic self-fulfilment is also related in *The Second Sex* to a 'conversion', which implies a renunciation of the oppressive 'possession' of others and a recognition of the other as a subject.

In *The Second Sex*, Beauvoir sought to combine an ethics with a theory of oppression and an existentialist phenomenology with a philosophy of history, the latter a combination not unusual in Paris in the 1940s, but none the less fraught with problems. The theory of authenticity, which is developed from Sartre's ahistorical, dualistic ontology, tends to collide with the dialectical and historical ontology inspired by Hegel and Marx. Even though Beauvoir is a forerunner for modern feminist theory, her philosophy has been criticized by feminists. The central concept of transcendence, which implies being a free, self-determining subject that can realize itself in self-chosen activities, is problematic since it tends not only to be conflated with authenticity, but also to be equated with men's traditional way of life and activities. For women to leave immanence, the confined animal-like existence that they have been assigned, they have to transcend the traditional female life-world, which is accordingly denigrated in Beauvoir's philosophy. Bearing and rearing children is not defined as transcendence. Simone de Beauvoir does not

question the apparent androcentricity in this, but uses the concept to criticize the exclusion of women from the public sphere and from the arts (see Feminism; Feminist ethics; Feminist political philosophy).

List of works

Beauvoir, S. de (1943) *L'invitée*, Paris: Gallimard; trans. Y. Moyse and R. Senhouse, *She Came to Stay*, London: Secker & Warburg, L. Drummond, 1949.(Beauvoir's debut, a novel which is an account of a triangular relationship between one man and two women. Its philosophical theme is the conflictual relation between human beings, considering the fact that one exists for and is judged by the other.)

Beauvoir, S. de (1944) *Pyrrhus et Cinéas*, Paris: Gallimard.(Beauvoir's first philosophical essay, which analyses the human being as transcendence and human interdependence. It is also her first inquiry into existentialist ethics.)

Beauvoir, S. de (1946) *Tous les hommes sont mortels*, Paris: Gallimard; trans. L.M. Friedman, *All Men Are Mortal*, Cleveland, OH: World Publishing Company, 1955.(Through the story of an immortal man whose experiences reach over the centuries, Beauvoir investigates in this novel the importance of human mortality for the meaning of human life.)

Beauvoir, S. de (1947) *Pour une morale de l'ambiguïté*, Paris: Gallimard; trans. B. Frechtman, *The Ethics of Ambiguity*, New York: Philosophical Library, Citadel, 1948.(Simone de Beauvoir's existentialist ethics, centred around the concepts of ambiguity. Authenticity, freedom and the relation between ethics and politics are essential themes.)

Beauvoir, S. de (1948) *L'existentialisme et la sagesse des nations*, Paris: Nagel.(Contains four essays previously published in *Les temps modernes*, whose themes are the metaphysical novel, ethics and politics, revenge and justice, and whether existentialism is a philosophy of despair.)

Beauvoir, S. de (1949) *Le deuxième sexe, tome I, Les faits et les mythes, tome II, L'expérience vécue*, Paris: Gallimard; trans. and ed. H.M. Parshley, *The Second Sex*, London: Jonathan Cape, 1953.(A comprehensive study of the situation of women from prehistory to the 1940s, which shows Beauvoir's philosophy in its maturity. Introduces the important notion of woman as the Other. Note that the English translation is neither complete nor wholly correct philosophically.)

Beauvoir, S. de (1951-2) 'Faut-il brûler Sade', *Les temps modernes*, Dec. 1951, Jan. 1952; also in *Privilèges*, Paris: Gallimard, 1955; trans. A. Michelson, 'Must We Burn de Sade?', in *The Marquis de Sade: An Essay by Simone de Beauvoir, with Selections from his Writings*, New York: Grove Press, 1953.('Faut-il brûler Sade', an essay on Marquis de Sade's philosophy, also shows important aspects of Beauvoir's ethics. Republished in the essay collection *Privilèges* along with 'La pensée de droite aujourd'hui', which treats right-wing ideology, and 'Merleau-Ponty et le pseudosartrisme', a defence of Sartre's philosophy against Maurice Merleau-Ponty's critique in *Les aventures de la dialectique*.)

Argues that Beauvoir's ethics is an 'art of living', which she formulated through her autobiography and fiction.)

Beck, Jacob Sigismund (1761-1840)

Beck played a brief but important role in the development of post-Kantian philosophy. A former student of Kant, he published at his teacher's instigation three volumes of 'Explanatory Abstracts' *of Kant's major writings. In the third volume Beck presented what he regarded as the 'Only Possible Standpoint' from which Critical Philosophy had to be judged if misunderstandings of Kant's work were to be avoided. His 'Doctrine of the Standpoint' involved a 'reversal' of the method of the Critique of Pure Reason and the elimination of the 'thing-in-itself' from Kant's theoretical philosophy.*

Beck was born in West Prussia in 1761. As a young man he went to Königsberg to study philosophy with Kant, and mathematics with C.J. Kraus and J. Schultz. In 1791 he habilitated at the University of Halle with a thesis in mathematics. In the same year, he accepted an offer from Kant to write *Erläuternde Auszüge (Explanatory Abstracts)* of Kant's major writings. Kant's hope was that Beck would make his philosophy more accessible to the general reader and answer some of the criticisms that had been levelled against it.

Over the next few years, a highly instructive correspondence ensued between them in whichBeck elicited often detailed comments from his teacher. For example, in response to an enquiry about the dynamical theory of matter, Kant admitted that the explanation of the difference in density in matter that he had given in his *Metaphysical Foundations of Natural Science* was circular. As a result, Kant later significantly revised his theory of matter in his *Opus postumum*.

In 1793 the first volume ofBeck's *Auszug* appeared, explicatingKant's *Critique of Pure Reason* and *Critique of Practical Reason*. The second volume, addressing Kant's *Metaphysical Foundations of Natural Science* and *Critique of Judgment*, came out in the following year. This volume also made available for the first time the original introduction to the *Critique of Judgment*, which Kant had discarded in favour of a slightly shorter one and later entrusted to Beck.

Most important, however, is the third volume of the *Auszug* (1796), which Beck called the 'Only Possible Standpoint from which Critical Philosophy Must Be Judged'. From the start Beck had planned to respond to critics of the Kantian philosophy in a separate volume. As his work progressed, however, he became convinced that the presentation of transcendental philosophy in the first *Critique* leads the reader astray on several accounts. If it is the function of the categories to make originally possible the reference of our representations to an object, he wrote to Kant (11 November 1791), one cannot define 'intuition' in the manner of the *Critique* as a representation which immediately relates to an object. Nor is it appropriate to define the categories simply as concepts: reference to objects is not the result of, but is presupposed by, the application of concepts. Transcendental philosophy must thus elucidate the fundamental act through which we represent to ourselves an object originally. For in all thought, Beck argued, we first of all fix for ourselves a point of reference to which we then attribute (*beylegen*) determinations. Concepts are the results of this operation, which Beck calls 'original representing'.

Beck's 'Standpoint' consequently 'reverses' the method of the first *Critique*. WhereasKant had led the reader gradually to the highest point of transcendental philosophy, or the synthetic unity of consciousness,Beck commences with it: with the postulate to represent originally. He then argues that the categories are but different modes of this original activity. Space emerges in original representing; it is the original synthesis of the homogeneous: 'Before this synthesis there is no space; we generate it, rather, in the synthesis'. When the synthesis is fixated in an 'original recognition', there first arises the notion of a determinate figure: 'Together with original recognition, original synthesis generates the objective unity of consciousness… that is, it generates the original concept of an object' (1793-6: 144). Beck thus undermines the sharp distinction, so crucial to Kant's thinking, between intuition and concept, between what is given and what is thought. Since all objective reference is the result of original representing, he regards as meaningless the notion of a 'bond' or connection between representation and object. Indeed, the concept of such a bond, Beck argues, 'is the source of all errors of speculative philosophy'. The concept of a thing-in-itself is an aberration of critical philosophy. As he later wrote toKant, 'My intention was to bar the concept of the thing-in-itself from theoretical philosophy' (Letter of 20 June 1797).

Beck's 'Standpoint' met with mixed reactions. The orthodox Kantians regarded it as heresy, but others were more positive: J.G. Fichte, for example, acknowledged its merits in both introductions to his *Science of Knowledge*. Beck himself, however, sought his teacher's approval; when his efforts to convinceKant of the importance of his 'Standpoint' seemed to fail, his disappointment grew proportionally. In 1797Kant named notBeck but his colleague Johann Schultz when challenged to state publicly who best understood his philosophy ('Declaration against Schlettwein'), and when, two years later, he included Beck in his notorious 'Open Letter on Fichte's *Wissenschaftslehre*', Beck's alienation from his former mentor was complete. However, unbeknown toBeck, Kant's own reflections at the time began to make him more appreciative of some of Beck's ideas. In correspondence with J.H. Tieftrunk, Kant admitted that Beck's method of beginning with the categories was possible, and in the *Opus postumum* he eventually experimented himself with what could be described as a reversal of the method in Beck's sense: 'that we have insight into nothing except what we can make ourselves. First, however, we must make ourselves.Beck's original representing' (1936-8: 114).

In 1799 Beck was appointed to a chair at the university of Rostock, where he soon became rector. Although he published several books over the next few decades, they were of little philosophical consequence.Beck died in Rostock in 1840.

Behaviourism in the social sciences

Classical behaviourism has had almost no direct reflection in the social sciences, in that there has never been a behaviourist social psychology or sociology. However, various features of the cluster of behaviourist doctrines have been widespread in the human sciences. Behaviourism as it developed from its roots in the proposals of Watson, and in its transformation by Skinner, had two influential aspects, one metaphysical and the other methodological. The metaphysics of behaviourism was positivistic. It was hostile to theory, favouring a psychology the subject matter of which was limited to stimuli and responses. It was hospitable to the conception of causation as regular concomitance of events, rejecting any generative or agent causal concepts. The methodology of behaviourism was hospitable to simple experimental techniques of inquiry, seeking statistical relations between independent and dependent variables. It was hostile to descriptions of human action that incorporated the intentions of the actor, favouring a laconic vocabulary of neologisms. Metaphysically and methodologically behaviourism favoured the individual as the locus of psychological phenomena. But, in practice, the use of statistical analyses of data abstracted psychological processes from real human beings leaving only simplified automata in their place.

1 The behaviourist legacy in social psychology

Despite the influence of aspects of behaviourism on mainstream psychology, in one important respect experimental (or 'old paradigm') social psychology was anti-behaviourist, in that it was in some ways anti-positivist. For example Tajfel's (1982) theory of intergroup relations proposed a cognitive mechanism of social comparison to explain observed correlations. Festinger's (1957) cognitive dissonance theory was based upon the alleged existence of cognitive discomfort in the presence of contradiction between expressed beliefs and actions. Yet the methodological influence of behaviourism is very clear in that both Tajfel and Festinger, and indeed many social psychologists of the post-war generation employed an experimental methodology that was a direct descendent of the methods of inquiry of behaviourism. Only the statistical trends which could be discerned in objectively described experimental manipulations of independent variables were to be admitted into an alleged 'truly' scientific social psychology as data. In this respect 'new paradigm' social psychology, particularly the role-rule model of Harré and Secord (1972), differed considerably in that a methodology of account analysis was recommended instead of simple experimentation. The history of social psychology can be seen in two stages: first the rejection of the metaphysics of behaviourism and only much later the abandonment of its methodology.

Behaviourism was both a learning theory according to which all human behaviour consisted in conditioned responses to types of environmental contingencies and a method of investigation in which the study of mature organisms simply consisted in the attempt to manipulate stimuli so as to discover which responses had indeed been installed in them. Even after the abandonment of behaviourism as general theory of human conduct (Danziger 1990) the use of the 'experimental' method persisted in social psychology. It was assumed that the complex situations in which human beings found themselves could be split up into simple states of the environment which could be treated as values of variables. Responses too were partitioned in a similar manner. Neither the role of the actor's interpretation of the stimulus conditions nor the actor's intention in responding were admitted as relevant, or as competing with the interpretations imposed by experiments (Milgram 1974). By an elementary application of Mill's Canons of Induction, that an effect which was always found to follow a certain phenomenon and which, in the absence of the phenomenon, did not appear, statistical trends in the relationship between stimuli and responses were offered as psychological laws. From the point of view of the social sciences the most important and most paradoxical applications of the experimental method were in social psychology.

The application of the methodological part of the behaviourist paradigm in social psychology led to the setting up of a number of experimental programmes centred around a variety of human social phenomena (Lindzey and Aronson 1968). For example the investigation of interpersonal liking (Zajonc 1968); of the fact that when they were with groups people tended to follow majority opinion (Asch 1956); of the conditions under which people behaved aggressively (Berkowitz 1962), all used the 'experimental' method. Paradoxically this approach to social behaviour in which the role of the individual human actor as agent undertaking various projects, alone or with others, was swept away and replaced by the idea of an automaton reacting with exactly those responses to which it had been conditioned, was dominant in that home of the ethos of the individual, the USA. This poses a fascinating

problem for the sociology of science.

2 The critique of behaviourism

It was the acceptance of a Cartesian metaphysics of mind that had led to scepticism about the possibility of public knowledge of mental states and processes from which the original impetus to a behaviourist treatment of problems in the human sciences had come. The most influential criticism of behaviourism was directed not at its Cartesian metaphysics, but at the limitations that it imposed on the possibility of obtaining scientific knowledge of other minds. This line of criticism developed into the 'first cognitive revolution' initiated by J.S. Bruner (1973) and G.A. Miller (Miller and Johnson-Laird 1976). Adopting the hypothetico-deductive conception of scientific method the new cognitivists saw the experiment as playing the role of a test for a hypothesis about publicly unobservable mental processes, rather than as a datum to be used in an induction to a correlative law of stimulus and response. The 'cognitive science' movement developed out of the insights of Bruner and Miller by the adoption of the computer analogy, as a way of systematically formulating hypotheses about mental processes. The computer is to the brain as the running of a programme is to the mental activity of that brain.

A more realistic approach to the study of social psychology, that developed in the 1970s, led to a growing emphasis on language as the main medium of human interaction (Harré 1977). In the behaviourist and immediately post-behaviourist eras, language appeared only in various so-called 'instruments', such as questionnaires, rating scales and so on. Many 'experiments' consisted in asking people to read stories and then to answer questions about their opinions of these stories. Why not, it was asked (for example by Shotter 1993), just abandon misleading talk of experiments, and turn to an analytical study of the many forms of human communication?

3 The behaviourist legacy in sociology

In sociology something akin to behaviourism developed under the influence of the three key factors identified above in the origins of behaviourism in psychology - a positivist philosophy of science, a search for statistical correlations between publicly observable phenomena and a 'regularity' conception of causality. The most influential proponent of positivistic sociology was Émile Durkheim. In his famous work on suicide (1908) he correlated local suicide rates with the values of broad social variables. Durkheim also offered to posterity another, non-statistical sociological method, in which publicly observable social phenomena, such as religious ceremonies, were subject to hermeneutical reinterpretation as covert symbolizations of social structure. The history of the debates over sociological method could be presented as a dispute between Durkheim and his *alter ego*.

Ethnomethodology was developed by Harold Garfinkel and his co-workers explicitly in opposition to Durkheimian social fact methodology. Garfinkel (1967) looked at the way social facts, such as suicide statistics, were produced. He found that they were the product of very complex conversational interactions, in the course of which people with various rights and standings took part in a complex and often quite long-running negotiation. This led Garfinkel to a very close analysis of the (conversational) procedures by which everyday reality was constituted as something normal and unattended. At this point we are a long way from positivism. However by a strange shift in focus the very method by which Garfinkel proposed to unveil the methods by which ordinary folk created their worlds turned into a kind of positivistic empiricism. In CA ('conversation analysis'), elementary conversational acts (as identified by the analyst) are sorted into statistical patterns, independent of all contextual features whatever. This development has been subjected to much the same kind of criticism as was classical behaviourism, namely that as a positivistic reduction of the phenomena that define a field of interest of a science it eliminates the thing that it should be attempting to discover by means of a context sensitive methodology, namely the cultural conventions by reference to which the micro-orderliness of social life is maintained.

4 Summary

The behaviourist paradigm has left its traces everywhere in the human sciences and particularly in social psychology. Despite paying lip-service to the idea that human beings in social interaction are active agents engaged in jointly realizing certain projects, plans and intentions and sometimes antagonistically attempting to force their projects on others, we have a view of human social actors as mindless automatons, mere spectators of processes over which they, as individuals, could have no control. This metaphysical position is still implicit in much of the work of US social psychologists (Wrightsman and Dew 1980) and to a much lesser extent in Europe

(Farr and Moscovici 1987). The metaphysical foundations of microsociology and social psychology have been strongly criticized. But to treat formalized discussions between psychologists and their subjects as experiments is, according to the critics, to do little more than offer a rhetorical re-description of something which is utterly unlike an experiment in the natural sciences. Instead it is argued that an acknowledgement of the fact that what are treated as experiments are really conversational interactions and should be analysed as such, is the way forward (Potter and Wetherell 1987). All that a psychological experiment can do, if seen in its true light as a kind of conversation, is to enable us to discover the local conventions of social discourse. Once this is achieved we can ask whether some such conventions can be identified in all human communities of which we have any knowledge.

Behaviourism, analytic

Analytical behaviourism is the doctrine that talk about mental phenomena is really talk about behaviour, or tendencies to behave. For an analytical behaviourist, to say that Janet desires ice cream is to say that, all things being equal, she tends to seek it out. To say that Brad is now feeling jealous is to say no more than that he is now behaving in a way characteristic of jealousy, or perhaps that he would do so under appropriate provocation. Analytical behaviourism differs from methodological behaviourism in insisting that our ordinary use of mental language really is, in some sense, already about behaviour. The methodological version claims either that in doing psychology we should restrict ourselves to notions which can be defined behaviourally, or, sometimes, that our general psychological language, even if not already definable in this way, should be reformed in this general direction.

The most telling objection to this account of the mind is that it is inconsistent with the requirement that mental states are causes of behaviour. Ordinarily we might note that Brad has a tendency to display jealous behaviour with little provocation, and conjecture that this is caused by his feeling jealous (rather than, say, practising for his forthcoming part in a Jacobean tragedy). But according to analytical behaviourism his feeling jealous just is his tendency to the behaviour, and since nothing causes itself, his jealousy cannot be the cause of the pattern of behaviour.

1 Introduction

Analytical behaviourists hold that there is a conceptual connection between behaviour and mental states. Talk about mental states just is talk about behaviour and dispositions to behaviour. This can be discovered, the doctrine insists, by proper conceptual analysis of the mental language we use. In its strongest versions the idea is that there can be translations between mental language and behavioural language; for example they might have held that ‘Janet desires ice cream’ - apparently postulating something about her internal states - can be translated without loss of meaning as ‘Janet is likely to eat ice cream’. Sometimes analytical behaviourists admitted that the translations might be difficult or impossible to provide, but contended that there was, nevertheless, some unspecified sort of analytical entailment between mental talk and behavioural talk. Another issue, essentially terminological, is whether the analytical behaviourist claims to eliminate mental states. On one way of saying it, the behaviourist discovers that there are no mental states as such - but mental language is perfectly fine because it is about behaviour. The other way has it that mental states exist but are not internal, occult entities; rather they are to be identified with behaviour or behavioural dispositions. I will use the latter way throughout.

I will start with a few words about the doctrine’s roots, and why it seemed so appealing, and in addition explain the usual arguments for it. Then I will discuss the standard objections and assess the important contribution that the doctrine has made to the philosophical treatment of the mind.

2 Influences and arguments

A first, important influence on analytical behaviourism was the doctrine of verificationism (see Meaning and verification; Operationalism). According to one version of this view, the meanings of statements are given by the procedures used to find out if they are true. This was supposed to eliminate meanings as occult entities, and put the subject on a scientific footing. Anyone attracted by that view would have seen considerable merit in behaviourism. For we typically verify statements about other people’s mental states by looking at their current behaviour (including verbal behaviour), or their behaviour over time, drawing conclusions about the dispositional patterns that emerge.

A related influence was that of the success of methodological behaviourism (sometimes known as scientific behaviourism). This somewhat weaker doctrine stipulates that for the purposes of psychology we use terms for mental states which are defined in terms of behaviour (see Behaviourism, methodological and scientific). This was perhaps good advice in the early part of the century; in any case behavioural evidence was the only access then available to psychological information, and the advice yielded reasonable results. The dominance of this idea left philosophers in a difficult position. What scientific psychology talked about was defined in terms of behaviour. The denial of analytical behaviourism would therefore entail that ordinary discourse about the mind is simply not

about the same things as scientific discourse - bad news, indeed, for scientifically-minded philosophers. Rather than risk accepting that consequence, it seemed better to insist that everyone really was talking about the same thing, and thus that analytical behaviourism was true.

Another approach to this problem can be found among the methodological behaviourists. We might call it revisionary behaviourism - the view that, to the extent that ordinary talk is not about behaviour, it is defective and should be revised in line with scientific talk. This was never popular amongst philosophers, perhaps because of its consequence that all ordinary talk about psychology before behaviourism was seen as deeply defective. It is hard to believe that Aristotle was not saying something true when he attributed beliefs to Plato.

A crucial influence, especially in the British tradition, was Wittgenstein's scepticism about the possibility of private states contributing to the meaning of expressions in public language (see Private states and language). If you think that private states can have no role in fixing meaning, then behaviour is the only game in town.

The most attractive thing about analytical behaviourism is that it undoubtedly got some things right. While it might be strange to think that the meaning of mental language is exhausted by talk of behaviour, there surely is some kind of analytic link between behaviour and mental states. If you don't know that someone who desires something will, other things being equal, behave so as to seek it out, then something is wrong with your concept of a desire. If I believe that Janet truly does desire ice cream, and that her desire isn't overruled by another, then there is something deficient in my concept of desire if I am not remotely puzzled when she blithely ignores a convenient ice cream stall.

Behaviour can trump introspective evidence; we are familiar with people who sincerely claim to have desires which they make no attempt to fulfil, even when they claim to have no countervailing desires and believe that the means to their fulfilment are available to them. In such cases you might say that the person doesn't *really* have the desires they say they have, whatever they believe about their desires. If we are tempted by that idea, it might be because it follows from what we mean by desire: that someone who truly desires something behaves so as to fulfil that desire.

3 Objections

There are very few analytical behaviourists left. A range of objections has culled their number over the years, and has led to newer views in the philosophy of mind. I will discuss objections - again not entirely independent ones - in order of increasing severity.

A first objection is that some mental states could have no behavioural consequences. Simple examples of this may merely show that sometimes one mental state outranks another. Suppose that I love ice cream, but am so embarrassed by this that I resolve never to touch it, and succeed in never manifesting in any way whatsoever the difficulty this causes me. Have we not a counterexample to behaviourism?

The behaviourist has two options. One is to say that if this alleged desire has no impact at all - say in exciting my salivary glands when I see photographs of cool, creamy ice cream, and so on - then I indeed do not have any such desire. Another is to point out that there is a case of a resolved conflict of desires here: what I desire over all - to avoid embarrassment - is manifested in behaviour; and the analytic connection between all-things-considered desires and behaviour is maintained.

A stronger version of this objection involves mental states the expression of which is somehow blocked. Perhaps someone could be in pain but, because they are controlled in various ways, cannot express it. A disembodied brain might be an extreme case. Here the analytical behaviourist must resort to the disposition's being there, but being blocked. The dispositions are dispositions to behave in normal circumstances. Although one might worry about how to specify these normal circumstances, these sorts of objections do not seem too troubling.

Behaviourists have more trouble than most in accounting for consciousness. Whilst they can without conceptual difficulty accept that individuals know more about their own mental states than those of others - analysed as having behavioural dispositions which are themselves foreknowledge of their future behaviour - they are hard pressed to explain why this should be so, since the usual behavioural evidence is not available to them.

There is, moreover, no real account of the *nature* of consciousness. Perhaps no one has a satisfactory account, but

behaviourists are by their very own doctrine committed to refusing to countenance internal mental states. This leaves them with three options. They can accept conscious states but say they are not mental - but this is a terminological trick that leaves them with an ontology far from the spirit of behaviourism. They can deny that consciousness exists at all - which might be philosophically comforting for some but rather hard to do while keeping a straight face. Finally they can identify consciousness with behaviour or behavioural dispositions. The second, po-faced, option seems to have been most common; none is without difficulty.

The promise of behaviourism was that it would provide an analysis of the meaning of mental language in terms of behaviour. It rapidly became obvious that actually providing such an analysis was not easy: even a flawed one, and even for the simplest cases. The formulation that became popular was that mental states pick out a vague class of behaviour, and this is why the analysis cannot be done in practice. So mental language cannot be dispensed with, since the vagueness is useful to us in tying together the groups of behaviour-patterns, and is ineliminable. This mental language, nevertheless, has nothing but behaviour and behavioural dispositions to be about.

There was, however, a deeper reason for the difficulty than just vagueness. The problem is that there simply is no class of behaviour-patterns associated with individual mental states. Suppose I believe there is a dagger before me. Do I act as if nothing is there, thinking weapons in very poor taste and best ignored? Do I grab it, believing that the gods have put it there to assist in fulfilling my desire to take revenge on my enemies? Do I book in for analysis, thinking this is a hallucination brought on by feelings of remorse and guilt for what happened at a recent departmental committee meeting? Clearly it depends on my other beliefs and desires. This is very different from the sorts of worries mentioned above when we were considering ways in which the normal responses allegedly associated with mental states might be blocked. Here we see that there are, in fact, no normal responses associated with individual mental states.

So talk of 'vague' connections between individual mental states and behaviours misses the point. The point is that, to the extent that there are analytic connections, they are between complexes of mental states and complexes of behaviour.

The final objection, and perhaps the most telling, is that analytical behaviourists must deny that mental states ever cause behaviour. It is central to the idea of a mental state that they sometimes are the cause of our actions. Janet's desire for ice cream actually causes Janet's arm to go up and her legs to move her body towards the ice cream van. For the analytical behaviourist, however, desire for ice cream never *causes* ice cream-seeking behaviour, even when all the attendant beliefs and desires are in place. Since analytical behaviourists are typically physicalists, they admit that there are internal causes of behaviour, but say that these are not mental states. The mental states are the very behaviour caused by the internal states. Further, the behaviour cannot cause itself. The case of dispositions is even harder. The analytical behaviourist has to come up with something to say about the relationship between internal states and the behavioural dispositions. But the causes of the dispositions cannot be the dispositions themselves. So, to the extent that we think that behavioural tendencies like Brad's tendency to jealous behaviour are caused by some mental state rather than another, we cannot accept analytical behaviourism.

While analytical behaviourists were on to something in seeing that there were analytic connections between behaviour and the mental, they drew too strong a connection. What is analytic, they thought, cannot be contingent. But whatever causes Janet's legs to move is some physical system of neurones, nerves and muscles. And it is contingent that that system of neurones, nerves and muscles does the work. She could have had different neurones, used different muscles, or perhaps even had a prosthetic brain. The connection between the behaviour and the mental language, however, is necessary; it is impossible that she, Janet, could desire ice cream without having the appropriate dispositions. The connection is also graspable, in some sense, just through understanding the meaning of the mentalistic language involved.

What has gone wrong here is that the kind of analytic connection they are looking for was too direct. We are now more familiar with analysis proceeding indirectly via how some contingent matter actually is. Imagine a town that has had its water poisoned. The townsfolk coin the phrase 'death potion' to name whatever it is that is actually doing the killing. 'Death potion' is whatever is actually having a certain causal influence on the townsfolk; killing them, in this instance. As it happens, the poison is cyanide. Eventually the townsfolk find this out. They find out that 'death potion' is cyanide; and analysis played a key role in this, via the meaning of 'death potion'. Nevertheless it is quite contingent that the poisoners used cyanide - they could easily have chosen something else.

4 The legacy of behaviourism

The last objection to analytical behaviourism is the starting point for the families of views that have come to replace it. Once we see that analysis gives us indirect linguistic access to unknown internal things - such as whatever it is inside people's bodies that is killing them off - we can accept what is right about analytical behaviourism and yet embrace internal states.

In the example above, the analytic connection was between 'death potion' and whatever it was that (typically) played a certain causal role (the role of causing the sudden spate of deaths). So we sometimes use causal properties to identify states inside systems we do not know much about. It is a move like this that can meet the requirement that mental states cause behaviour while respecting the analytic insight. Janet's desire for ice-cream might be understood not as the ice cream seeking behaviour, but as whatever causes the behaviour. Instead of mental states being behaviour or clusters of behaviour, they might be analysed as states which are typically caused in various ways, and which typically cause the clusters of behaviour. Views of this kind are called functionalism (see Functionalism).

Behaviourism, methodological and scientific

Methodological *behaviourism is the doctrine that the data on which a psychological science must rest are behavioural data - or, at the very least, publicly observable data - not the private data provided to introspection by the contents of an observer's consciousness.* Scientific*, or, as it was sometimes called, 'radical', behaviourism contends that scientific psychology ought to be concerned only with the formulation of laws relating observables such as stimuli and responses; not with unobservable mental processes and mechanisms such as attention, intention, memory and motivation. Methodological behaviourism is all but universally embraced by contemporary experimental psychologists, whereas scientific behaviourism is widely viewed as a doctrine in decline. Both forms of behaviourism were articulated by J.B. Watson in 1913. B.F. Skinner was the most prominent radical behaviourist.*

In addition to its empiricist strictures against inferred mental mechanisms, radical behaviourism was also empiricist in its assumptions about learning, assuming that: (1) organisms have no innate principles that guide their learning; (2) learning is the result of a general-purpose process, not of a collection of mechanisms tailored to the demands of different kinds of problems; and (3) learning is a change in the relation between responses and the stimuli that control or elicit them. Many of these ideas continue to be influential, for example, in connectionism.

1 Methodological behaviourism and scientific behaviourism

Methodological behaviourism emerged as a reaction to introspectionism, which was the doctrine that psychology was the science of conscious states (see Introspection, psychology of §4). This latter doctrine placed the psychological scientist in a uniquely favourable epistemological position, because knowledge of the contents of consciousness seems direct, unmediated by sensory systems of questionable trustworthiness. However, it had two fatal weaknesses. (1) Because the data (the contents of consciousness) were not publicly observable, there was no way of settling disputes about whether the observer was reporting them accurately. (2) Because there was no way of securing reports from animals, psychology was confined to the study of human consciousness, a profoundly abiological state of affairs. These difficulties were obviated by the emergence of the doctrine that the data of psychology were behavioural. If you doubted the accuracy of someone's report about how their subjects behaved, you could come to their laboratory and see for yourself. And the behaviour of many nonhuman animals was as observable as human behaviour, so it was possible to approach psychology from an evolutionary perspective, dispensing with the pre-Darwinian notion that man was uniquely different from a scientific standpoint.

The doctrine that psychological theory must rest on behavioural (or, in any event, publicly observable) data in no way implies that psychological theory should eschew discussion of inferred mental processes and mechanisms, which was the essence of *scientific* behaviourism. If there were any such implication, then physics could not concern itself with such inferred entities as quarks; nor could classical genetics concern itself with genes, and so on. Cognitive psychology is thoroughly behaviourist in its methodology, but it is anti-behaviourist in its theorizing, which focuses on attention, perception and memory. Scientific or (as it was often called) 'radical' behaviourism is an eliminativist doctrine; it claims that traditional mental phenomena such as these have no place in a scientific psychology (see Eliminativism).

B.F. Skinner, the best-known radical behaviourist, argued that concepts such as memory, motivation, emotion, attention, intention and perception should not be part of scientific psychology. He argued that a scientific psychology should be concerned only with physical observables. This was the general position of logical positivism, which flourished for the first half of the twentieth century (see Logical positivism), but has vanished from contemporary physics, which routinely discusses unobservable entities such as quarks. Similarly, radical scientific behaviourism, which enjoyed a considerable vogue for several decades near the middle of the twentieth century, has diminished in significance with the rise of cognitive psychology.

2 The two schools of scientific behaviourism

At the peak of its popularity in the middle of the twentieth century, there were two principal schools of scientific behaviourism, one identified with J.B. Watson and B.F. Skinner, the other with Ivan Pavlov and Clark Hull. (The

latter are sometimes called neo-behaviourists.) Both schools were principally concerned with learning. Both took for granted the traditional empiricist assumption that the organism was initially a blank slate. That is, they assumed that learning was not constrained and directed by innate problem-specific information-acquisition mechanisms whose problem-specific structure made implicit a priori commitments to the structure of the information to be acquired. Such commitments, popular among Rationalists such as Descartes and Leibniz, involve innate principles of the mind (see Nativism), and behaviourists rejected the idea that innate principles guided learning. On the contrary, the learning process was thought to be a general-purpose process, applicable regardless of the substance of what was learned. The essence of the process was thought to be the bringing of a response the animal made in the presence of a stimulus under the control of that stimulus. This last assumption gave rise to the term ‘stimulus-response’ (or ‘S-R’) psychology.

The two schools had contrasting views on whether any kind of ‘theoretical construct’ was admissible. A theoretical construct was an entity (for example, a memory or an associative bond) or process (for example, attention) or state (for example, a motivational state) that played a role in explaining observed behaviour but was not directly observed (see Observation). The Skinnerian school thought that all such constructs should be rejected; even such traditional constructs as the associative bond. The Hull-Pavlov school, on the other hand, thought that a modest number of constructs were essential, but should be closely based on behavioural observation and should have plausible physiological embodiments. When a rat learned to press a lever to obtain food, Skinnerians explained this simply by an appeal to the ‘law of effect’, which says that when a response is emitted in the presence of a stimulus and followed by a reinforcer, the probability of that response in the presence of that stimulus increases. They thought this kind of Baconian explanation - subsuming observations under generalizations about lawful regularities - was all that psychology should aim for (see Bacon, F.). The Hullians, by contrast, aimed for a physiologically plausible conception of the unobserved mechanisms. They imagined that the food reduced a drive (defined as a state of high nervous arousal), which strengthened synaptic connections between sensory and motor neurons - the sensory neurons sensitive to the stimulus and the motor neurons that controlled the response in question. The drive and the change in synaptic connectivity (or associative strength) were the kinds of physiologically plausible theoretical constructs that Hullians thought should play a central role in psychological explanation. The proffered physiological interpretation of these constructs made it reasonable to suppose that one might someday actually observe them.

In short, the Skinnerians were opposed to inferred entities of any kind in psychological explanation, while Hullians wanted to restrict the inferred entities to those with a ready physiological interpretation. Both schools were sceptical of the explanatory value of the mental concepts and mechanisms that have traditionally played a central role in more cognitively oriented psychological theories - attention, perception, intention, memory, motivation (see Explanation).

Behaviourist ideas continue to be influential in contemporary psychology. The assumption of a general-purpose learning process, the assumption that the building blocks of psychological theories should be neurobiologically plausible, and the assumption that learning is fundamentally about changes in synaptic connectivity (associative strengths) are still points of departure for much contemporary work in psychology - both work on animal learning and work on human learning and perception done under the heading of connectionist or neural-net modelling (see Connectionism; Learning §1).

3 Critique of scientific behaviourism

The assumptions of scientific behaviourism may be challenged on a number of fronts. As a perfectly general proposition, the blank-slate assumption is demonstrably false. Fledglings of some species of song bird (for example, white-crowned sparrows) must hear an adult male song of their own species during a critical period if they are to develop normal song. It does not matter what other songs they hear. Even when those other songs are more numerous than that of their own species, the song-learning mechanism picks out the correct song, implying that it is innately tuned to aspects of the song to be learned that distinguish that song from those of other species. The mechanism that mediates song learning has been termed an instinct to learn. Like all instincts, it is a solution to one particular problem, obviously unsuited to many other learning problems. Some contemporary learning theorists argue that the problem-specific structure seen in this and many other examples from the zoological literature is characteristic of all learning mechanisms. Thus, it is open to question whether there is such a thing as a

general-purpose learning process (see Innate knowledge; Language, innateness of).

Also demonstrably false is the assumption that an animal must respond during learning. The juvenile white-crowned sparrow is incapable of singing during the critical learning period; all it does is listen. Similarly, nestling buntings, when they are too young to fly, learn the centre of rotation of the night sky by watching the stars rotate about it. Months later, they use this knowledge to keep oriented during the night-time portions of their migratory flights. These examples of purely passive observational learning cannot be conceptualized in S-R terms. Ironically, the phenomenon most studied by Skinnerians has proven to be passive in just this way. To get the pigeon to peck the key, it suffices to arrange for it to observe that soon after the key is illuminated the food hopper opens. If it observes this sequence several times, it begins to peck the key, even if its pecking has no effect on food delivery; indeed, even if its pecking forestalls food delivery! Most learning depends on the perception over time of a systematic stimulus relationship; whatever response the animal may or may not make during the period when the relationship is perceived is of little relevance to the learning that occurs.

There are also many examples of learning that cannot readily be conceptualized as the formation of an association. One example is the learning of one's position by 'dead reckoning', which has been found in animals ranging from insects to humans. Dead reckoning is the integration of one's velocity with respect to time to obtain net displacement: computing where you are from how fast you have moved in which direction for how long. This method of determining where you are relative to where you started is so unlike the traditional conception of learning by association that people when first hearing of it often reject it as an instance of learning. However, if the pre-theoretical definition of learning is the process or processes by which we acquire knowledge from experience, then dead reckoning is demonstrably a principal means by which mobile animals acquire knowledge of their current position in the world from their experience of the direction and rate at which they have moved through it. This example points towards learning as computationally derived knowledge of the world rather than as associated experiences (see Learning §2).

Finally, the desirability of constraining the theoretical constructs of psychology to be neurobiologically plausible is debatable. Constraining psychological theory in this way presupposes that neurobiologists have *already* identified those aspects of neural functioning that are relevant to understanding processes such as memory, attention, and thought-processes whose existence we infer from their behavioural manifestations. If the aspects of cellular and molecular neurobiology that are centrally relevant to our understanding of these processes remain to be discovered or identified, then attempts to ground psychological theorizing in well-established supposedly relevant neurobiological mechanisms are certain to lead us astray in that they make us build on what will turn out to be the wrong neurobiological foundations. For the first several decades of the twentieth century, classical geneticists did not attempt to ground their genetic theorizing in biochemistry. It is a good thing that they did not, because the discovery of the biochemical identity of the gene in 1954 revolutionized biochemistry. The biochemistry of the gene in the 1990s rests on concepts and mechanisms undreamed of in the biochemistry of the 1940s.

Being

Although 'being' has frequently been treated as a name for a property or special sort of entity, it is generally recognized that it is neither. Therefore, questions concerning being should not be understood as asking about the nature of some object or the character of some property. Rather, such questions raise a variety of problems concerning which sorts of entities there are, what one is saying when one says that some entity is, and the necessary conditions on thinking of an entity as something which is.

At least four distinct questions concerning being have emerged in the history of philosophy: (1) Which things are there? (2) What is it to be? (3) Is it ever appropriate to treat 'is' as a predicate, and, if not, how should it be understood? (alternatively, is existence a property?) (4) How is it possible to intend that something is? Twentieth-century discussions of being in the analytic tradition have focused on the first and third questions. Work in the German tradition, especially that of Martin Heidegger, has emphasized the fourth.

1 Which things are there?

Which sorts of things are there? This question asks for an inventory of the population of the world. It is natural to assume that there are middle-sized physical objects, such as organisms and artefacts, but reflection reveals a variety of puzzles. Given that middle-sized objects are composed of simpler material, should our inventory include only the objects, or only the material, or both? Given that objects have properties, and that different objects can have the same property, should our list include those properties, or merely the objects which have them? What about events, or numbers, or times?

It is not immediately clear what kinds of consideration are relevant to answering the population question. How does one decide just which entities there are? One possibility is to think of the question 'What things are there?' as analogous to 'What things are humans?' Ordinarily we think that we can answer the question regarding the population of humans if we know what conditions must be met for a thing to count as human. So, perhaps, we can know which things there are if we know what conditions must be met for a thing to count as something which is. But to know this is to know what it is we are saying when we say that something is. It is to have an answer to the question which Aristotle says 'was raised of old and is raised now and always, and is always the subject of doubt, viz. what being is'.

2 What is it to be?

The form of the question 'What is being?' initially suggests that we should think of 'being' either as a name for an entity or as picking out some property, but both views have proved problematic. When one asks a question of the form 'What is Patagonia?' one is requesting information regarding which entity is picked out by the word 'Patagonia'. So it is perhaps natural to think that the question 'What is being?' is similarly raising an issue regarding the object which is referred to by the word 'being'. But, unlike 'Patagonia', 'being' is not a noun: it is the present participle of the verb 'to be'. This suggests a different analogy. When one asks 'What is running?' (and is not asking which thing is running) one is asking about the character a thing must have in order to count as running. By analogy one might expect that the question 'What is being?' raises the issue of which character or property being is.

The notion that 'being' names an entity was the first possibility explored. Parmenides reaches the extraordinary conclusion that there is only one unchanging item in the world inventory - being. He argues in two ways. First, anything which is not being, or is different from being, is not, since it *is not being*, so at most one being is, and that being is being itself. Parmenides is here treating 'being' as a name for a special sort of entity, call it 'being itself', and suggesting that it is correct to say that A *is* just in case A is identical with being itself. Parmenides' second line of argument assumes that all words, including 'being', are meaningful just in case they stand for some thing which is. He suggests that it is impossible truly to say or think that something, A, is not, for if A is not then 'A' stands for nothing. This has suggested to some that words which apparently refer to non-existent entities really do refer to entities which are, even though they do not exist.

Ancient philosophers found Parmenides' conclusions troubling. In response, Plato and Aristotle clarified the distinction between properties and the entities which possess those properties, and recognized that an entity can

have some property without being identical to that property. So the fact that A is, does not imply that A is identical to is (or being), and the fact that 'is' is meaningful need not imply that 'is' is the name of an entity. In particular, Aristotle held that those entities which are in the primary sense are those self-subsistent individuals which have properties, the substances. And whatever else 'being' might signify, it does not stand for a self-subsistent individual substance, being-itself (see Aristotle §12).

These distinctions leave open the possibility that 'A is' should be understood as asserting that A has a property, being. And there are strains in Aristotle's thought which attracted the tradition he established to this possibility, as well as strains which undercut this option. On the one hand, Aristotle thinks that it is wrong to see 'being' as picking out a class of thing, as 'human' does. In the 'human' case we assume that we already have a list of the things which are; we ask merely which characteristics distinguish the humans on that list from the nonhumans. For 'human' to serve this function it must be possible for some items on the list to qualify as humans and possible for some to fail to qualify. In the case of 'being' it is precisely the contents of that initial list which are in question, and 'being' cannot differentiate among the items on the list, as all of those items *must* qualify as things which are.

On the other hand, Aristotle hoped to discover which entities are substances by examining those predications in which we specify *what* a thing is, as opposed to merely specifying that some individual has some property. But it is sometimes possible to specify what a thing is without committing oneself to the claim *that* it is: 'Hamlet is a man'. This suggested to later philosophers that a name, such as Hamlet, stands for a possible entity, and that those possible entities which exist have an additional property, actual being, or existence. In that case, the 'is' in 'A is' would serve to distinguish two classes of entities - the actual and the merely possible.

3 Is existence a property?

It is possible to understand what a thing is without asserting that it exists. Kant uses this fact to criticize the view that existence is a property (see Kant, I. §2). Consider a disagreement concerning whether or not some entity, say God, exists. Even though there may be disagreement concerning details, the two disputants agree on a general description of God as omnipotent, omniscient and so on. This description constitutes the concept of God. If there were not such agreement concerning the concept there would be no real dispute. The disagreement concerns only whether there is something which has those properties which, if someone had them, they would be God. Now, if existence were a genuine property there would not be agreement on the concept of God. For in that case the believer's concept of God would differ from the atheist's concept of God in so far as the first would include the property of existence and the second would not. So existence cannot be part of the concept of God, it is not part of a description of the entity which is God, or any other entity, and is no property.

If existence is not a property, there must be something misleading about the grammatical form of the sentence 'God is'. The surface grammar suggests that the function of 'is' is to assert the property of existence of God. Kant suggests we handle this problem by reading 'God is' as 'Something existing is God'. This has the effect of removing 'is' from the predicate position and thus removing the appearance that existence is a property. It also moves 'God' from the subject to the predicate of the sentence, which has further consequences for our understanding of 'being'. Parmenides had argued that words are meaningful just in case they stand for something which is. And many had argued that entities which are merely possible are, even if they are not actual. But if apparently referring expressions such as 'God' are really parts of the predicate, they can be treated as descriptions, rather than as names for things that are, possible or otherwise.

These suggestions have been systematically developed in the twentieth century by Russell and Quine. Quine's work in particular has important implications for reflections on being. Since antiquity it has been thought that the answer to the population question depends upon the answer to the question regarding what it is to be. Just as A being human involves A satisfying some description which specifies what it is to be human, for A to exist involves A satisfying some description. But if the existential use of 'to be' expresses no property, this model cannot be right. In the assertion 'A is', A can be seen as having descriptive content, while the existential assertion says that there is *something* which satisfies *this* description. Since 'something' serves as a pronoun, this amounts to saying that 'to be is to be in the range of reference of a pronoun', or, 'to be is to be the value of a variable'. The sorts of things we say there are are the sorts of things which can satisfy our descriptions. If we say that there are primes greater than five, we are saying that there is something such that it is a prime and it is greater than five. Since only numbers can be prime, this sentence commits us to the existence of numbers. And numbers *are* just in case some

sentences of this type *are true*. Our ordinary assertions commit us to the existence of various types of entities. To know which types of entities exist we need to know only which of those ordinary assertions are true.

Quine's work also has important implications for the relationship between possible and actual existence. Since names need carry no ontological commitment, asserting that some entity is not does not imply that there is some sense in which that entity, though not actual, is. Quine (1953) uses this to argue that there is no warrant for 'expanding our universe to include so-called possible entities' (see Ontological commitment).

Several philosophers have criticized aspects of Quine's views regarding being. David Lewis (1986) has argued that Quine's own criterion of ontological commitment commits us to the existence of possible entities, and Alvin Plantinga (1974) and Peter van Inwagen (1993) have argued that necessary existence, at least, is a property. These developments point to a reawakening of interest in the issues of what it is for something to be and how we should understand possible and actual being.

4 How is an understanding of being possible?

The twentieth-century philosopher Martin Heidegger attempted to renew interest in the question of being. For Heidegger 'being' is not a name for anything, and he carefully distinguishes among the various questions concerning being. But he follows a distinctive strategy in discussing these questions. He hopes to answer the population question by first answering the question of what it is to be, and to answer this question by answering the question of how it is possible to intend things that are as things that are. He thinks we can answer this question if we come to see how any understanding of being is possible.

Heidegger holds that the recognition that being is not a property leaves an unresolved problem: on what should we base decisions regarding which entities are candidates for descriptions? Quine thinks that this question must be answered pragmatically, holding that there are no general a priori conditions which restrict the range of reference of our pronouns. Heidegger disagrees, holding that there are such conditions which are grounded in necessary conditions for intending anything at all.

We can put Heidegger's strategy in context by returning to Kant. Kant thinks that the recognition that existence is not a property leaves a serious issue unresolved: What are the necessary conditions on the possibility of the objects of experience? What are the a priori constraints on the range of possible entities which we can come to know? He answers by appealing to the necessary conditions on possible experience. For Kant, our sentences can be true of a physical object only if that object is a possible object of experience, and it is possible to experience an object only if it is possible to perceive it. So the range of reference of our pronouns for physical objects is restricted by the condition of perceivability (and its extension in causality). ' The perception which supplies the content of the concept [of actuality] is the sole mark of actuality' (Kant 1781: A225/B273).

Heidegger thought that Kant's strategy had been developed by Edmund Husserl. Husserl asked how it is possible for a subject to intend something distinct from its own mental states. We intend a variety of such entities, including physical objects, numbers and norms, and it is puzzling how a subject can intend such independent entities. In order to solve this puzzle, Husserl generalized the notion of linguistic meaning. Each conscious act involves a meaning which is distinct from the act itself, and it is through this meaning that the act is related to its object. The meaning of an act depends upon its being placed within a temporal 'horizon' of past and possible future apprehensions. My current apprehension, for example, has the meaning of 'perception of a rock from this angle'. The act of rock perception has this meaning in virtue of its involving the retention of past apprehensions of the rock from different angles and the 'protention' that, were I to move, additional specific rock perceptions would occur. Intentions directed towards different classes of entities are characterized by different structures of relatedness among current apprehensions, retentions, and protentions, and what it is for an entity of some type to be varies as a function of the structure of the intentions directed towards entities of that type.

Heidegger has serious disagreements with Husserl regarding intentionality. In particular, he holds that intentionality is primarily a matter of action rather than consciousness. For Heidegger the primary way in which we intend a hammer as a tool, for example, is in an overt act of hammering, rather than in an internal conscious act, and the conditions on intending a hammer have more to do with the conditions under which an act can count as hammering than with how we think of a hammer (see Intentionality).

Nevertheless, Heidegger follows a strategy which is similar to Husserl's. The early Heidegger seizes upon the temporal character of Husserl's understanding of intentionality: ' intentionality … has the condition of its possibility in temporality and temporality's ecstatic horizontal character' (1975 (1982): 268). And, since one can understand what it is for a class of entities to be through determining the conditions necessary for intending that class of entities, Heidegger concludes that ' the central problematic of all ontology is rooted in the phenomenon of time' (1926 (1962): 40). Concretely, such an investigation involves fixing the range of reference for various classes of pronouns by determining the necessary temporal features of intentions directed at entities of that type. To intend a tool as a tool involves intending it as usable in various ways, and to be a tool involves serviceability. To intend a being as *Dasein*, or a being like us, on the other hand, is to intend it as itself capable of intentionality. Given the above, this implies that we are entities who are open to the dimensions of past and future, and Heidegger concludes that ' temporality [is] the meaning of the being which we call "Dasein"' (1926 (1962): 38).

Later, Heidegger came increasingly to concentrate on the contrast between the presence of an entity and the temporal horizon in which it becomes present. He concluded that philosophers have always answered the question regarding what it is to be with variations on the claim that being is constant presence, or being always available for interaction, but had failed to investigate the distinctive character of the horizon which makes an encounter with presence possible. Much of the work of the French philosopher Jacques Derrida, who has been heavily influenced by Heidegger, also focuses on the relationship between an object and the horizon in which it is encountered.

Belief

We believe that there is coffee over there; we believe the special theory of relativity; we believe the Vice-Chancellor; and some of us believe in God. But plausibly what is fundamental is believing that *something is the case - believing a proposition, as it is usually put. To believe a theory is to believe the propositions that make up the theory, to believe a person is to believe some proposition advanced by them; and to believe in God is to believe the proposition that God exists. Thus belief is said to be a propositional attitude or intentional state: to believe is to take the attitude of belief to some proposition. It is about what its propositional object is about (God, coffee, or whatever). We can think of the propositional object of a belief as the way the belief represents things as being - its content, as it is often called.*

We state what we believe with indicative sentences in 'that'-clauses, as in 'Mary believes that the Democrats will win the next election*'. But belief in the absence of language is possible. A dog may believe that there is food in the bowl in front of it. Accordingly philosophers have sought accounts of belief that allow a central role to sentences - it cannot be an accident that finding the right sentence is* the *way to capture what someone believes - while allowing that creatures without a language can have beliefs. One way of doing this is to construe beliefs as relations to inner sentences somehow inscribed in the brain. On this view although dogs do not have a public language, to the extent that they have beliefs they have something sentence-like in their heads.*

An alternative tradition focuses on the way belief when combined with desire leads to behaviour, and analyses belief in terms of behavioural dispositions or more recently as the internal state that is, in combination with other mental states, responsible for the appropriate behavioural dispositions.

An earlier tradition associated with the British Empiricists views belief as a kind of pale imitation of perceptual experience. But recent work on belief largely takes for granted a sharp distinction between belief and the various mental images that may or may not accompany it.

1 Beliefs as sentences in mentalese: the language of thought

Fred's belief in the Devil cannot literally be a relation between Fred and the Devil. Otherwise he could not have the belief, unless the Devil existed. One response is to treat belief as a relation to sentences. To believe is to 'believe-true' a sentence: Fred believes-true 'The Devil exists'. But animals that lack a language have beliefs. My dog may believe that his master is home, or that it is time for a walk. Moreover, monolingual French speakers and monolingual English speakers may agree in what they believe, say, that it would be good if they knew more than one language, and yet they may not agree on which sentences they believe true. Finally, you might believe-true the sentence 'The Devil exists' and yet not believe that the Devil exists because you wrongly think that the word 'Devil' means 'God'. In this case what you believe is that God exists while wrongly thinking that the sentence 'The Devil exists,' is a good sentence to use to express this belief. For these reasons, and others, belief is usually thought of as a relation to a proposition. A proposition is what is expressed by a sentence; it is what is in common between sentences in French and English that mean the same; the proposition expressed is what is grasped when you understand a sentence. Monolingual speakers believe alike by believing the same propositions; dogs have beliefs by virtue of believing propositions despite not having a language to express them; someone who believes that the sentence 'The Devil exists' is true while thinking that 'Devil' means 'God' does not thereby believe that the Devil exists because they are wrong about what proposition 'The Devil exists' expresses. These remarks slide over a lively controversy concerning the ontological status of propositions (see Propositions, Sentences And Statements). Our immediate concern will be with a popular view that gives sentences a prominent role in the account of belief, but in a way which avoids the problems just rehearsed.

According to the language of thought hypothesis (LOTH), not only do certain sentences serve to provide the propositional objects of beliefs (and thoughts in general) but, in addition, the beliefs are themselves sentence-like. A sentence may be viewed as made up of significant parts put together according to certain rules. In the same general way, according to LOTH, beliefs have parts put together in certain ways (see Language Of Thought).

How does LOTH mesh with the idea that beliefs are relations to propositions? The idea is that a belief's propositional object is determined by how it is made up from parts which have representational or semantic

properties - that is, the parts stand for things, properties and relations much as the parts of a natural-language sentence do (see Semantics). In English 'biscuit' represents certain things, and 'crisp' represents a certain property, and when we combine them together to form the sentence 'Biscuits are crisp' we get a sentence that makes a claim that is true or false according to whether or not the things have the property. This is how the sentence expresses the proposition that biscuits are crisp (see Compositionality). In the same way, there are brain structures that represent things and properties, and when these brain structures are put together in the right way we get, says LOTH, a more complex structure, a sentence in mentalese, that represents the things as having the properties - as it might be, the sentence of mentalese that says that biscuits are crisp, that expresses that proposition, and that thereby provides us with a token of the belief that biscuits are crisp.

This theory can allow that dogs have beliefs. Dogs might have a language of thought even though they do not have a public language. It can explain how monolingual speakers of different language can agree in belief - their sentences of mentalese may express the same propositions. It also provides an explanation of a number of phenomena associated with belief. First, it explains how what a person believes can be causally relevant to what else they believe and what they do. If you believe that Mary is at the party and then learn that Mary is always accompanied at parties by Tom, you will typically come to believe that Tom is at the party. What you believe combines with what you learn to produce a new belief. LOTH explains these causal transactions as transactions between the structures that are the various beliefs. Much as a computer processes information by manipulating electronically coded structures so we arrive at new beliefs by virtue of our brains manipulating the symbols of mentalese. Similarly, what we believe contributes to explanations of what we do. My belief that there is coffee over there together with suitable desires may lead me to move over there by virtue of its being a belief that there is coffee over there. LOTH accounts for this fact in terms of the causal influence of the sentences of mentalese on the causal path to bodily movement.

Second, LOTH explains the fact that typically one who can believe that Jill loves Mary can believe that Mary loves Jill, and in general if you can believe that *aRb*, then you can believe that *bRa* (the phenomenon known as systematicity). The fact that if you can believe that *aRb*, then you can believe that *bRa* is explained by the fact that the state that encodes the former is a re-arrangement of the parts of the state that encodes the latter. And, of course, this explanation generalizes to explain more complex cases.

Finally, LOTH can explain our ability to form quite new beliefs (the property known as productivity). Just as we can form new sentences by novel combinations of the relevant words of a public language, so the brain can form new beliefs by means of novel combinations of the relevant words of mentalese.

LOTH thus explains a lot of what needs to be explained. Nevertheless, there are two serious problems for this view as applied to belief.

2 Two problems for LOTH

First, unless the claim that mentalese exists is trivialized - no matter what neuroscience reveals about how the brain processes information, what it reveals will count as the brain containing mentalese - LOTH involves risky speculation about how our brains work. The theory gives a hostage to fortune. Some are happy to accept this. If neuroscience reveals that there is no mentalese and that we do not process information in a sentential manner, we should say that we do not have beliefs and so embrace eliminativism about belief (see Eliminativism). This is, however, very much a minority view.

Second, LOTH leaves the intimate connection between belief and behaviour obscure. On the face of it predictions about the behaviour of highly complex organisms like ourselves should be enormously difficult. Trees bend in the wind whereas we put on jumpers, go inside houses, lean into the wind, cancel our games of tennis, or whatever. Unlike trees and simple machines, we respond to stimuli in enormously varied ways. Nevertheless we are quite good at predicting human behaviour. We all make many successful predictions of the following kind: someone who has uttered the word 'Yes' on hearing the sentence 'Would you like to come to dinner at 19.30 on the 21st?' will arrive around 19.30 at the house of the person the sentence came from. What we do, of course, is use hypotheses about what people believe and desire and predict in terms of the rule that subjects will tend to behave in such a way that they achieve what they desire if what they believe is true. Our subject's 'Yes' tells us what they desire, and what we predict - their turning up at the named time - is behaviour that will achieve their desire for

dinner.

Now we noted above how LOTH explains the way belief contributes to causing behaviour. In the same general way it explains how belief together with desire explains behaviour. For LOTH treats desires as like beliefs in being internal sentences of mentalese. The difference is that, as it is often put, the desires are stored in the ‘desire’ box, and the beliefs are stored in the ‘belief’ box. The metaphor of different locations marks the fact that beliefs and desires differ in how they relate to the world. Belief is a state that seeks to conform to how things are - the sight of coffee tends to extinguish my belief that there is no coffee near; whereas desire is a state that seeks to conform things to how it is - desire for coffee tends to bring one near coffee. The stored sentences that do the first job count as being in the belief box; the stored sentences of mentalese that do the second job count as being in the desire box. So the way belief and desire combine to produce behaviour is not a problem for the LOTH. The two ‘differently located’ stored sentences get together to produce the behaviour.

The problem, rather, arises from the fact that the connection between behaviour and what subjects believe and desire is most immediately one between behaviour and a rich system of belief and desire. Individual beliefs and desires grossly underdetermine behaviour. There is no behaviour that the belief that there is a mine near the tree, together with the desire to live, as such points to. It is, rather, a rich system of belief - to the effect, say, that there is a mine near the tree, that the mine is likely to be triggered by going near it, that moving one’s legs in such and such a way will not bring one near the tree, that there is not a bigger mine that can only be avoided by going close to the tree, that triggering mines tends to cause death, and so on and so forth, along with the desire to live being greater than the desire to test out the trigger system of the mines - that points to behaviour. When we give little illustrations of connections between subjects’ beliefs and desires and what they do, we take for granted a great deal about what they believe and desire. This is fine. It is by and large common knowledge. But the point remains that only rich systems of belief and desire have the intimate connection with behaviour. The same point could be made with the dinner invitation story. The prediction of our subject’s behaviour assumed a great deal by way of belief and desire. We assumed beliefs about what the words mean, about who uttered them, about which month was intended, …, and we assumed that there were no countervailing desires that outweighed the desire to go to dinner.

The problem for LOTH is that it takes as its starting point individual beliefs and desires. This leaves it seriously unclear what the theory has to say about the connection between a rich story about belief and desire, on the one hand, and behaviour, on the other. There is no behaviour that the individual belief that *p* and desire that *q* point to.*It is rich systems of both belief and desire that point in some reasonably determinate way to behaviour*. The challenge for LOTH is to find some kind of guarantee that the account of individual beliefs and desires it offers is such that if subjects have rich enough sets of these individual beliefs and desires, these rich enough sets of beliefs and desires will cause the reasonably determinate behaviour that tends to satisfy their desires if their beliefs are true.

3 Belief as a map by which we steer

One obvious fact about belief is the way we use sentences to state what we believe. An equally obvious fact is the connection between belief and behaviour via desire discussed above. F.P. Ramsey (1931) famously captured this idea by describing belief as a map by which we steer. The alternative to LOTH is an account of belief that sees belief as map like.

For LOTH, individual beliefs are fundamental; while on the map view systems of belief are fundamental. Inside us is a hugely complex structure that richly represents how things around us are in an essentially holistic way. When you believe the bank is bigger than the post office, there is no individual structure, no sentence of mentalese in your head, that represents your belief that the bank is bigger than the post office. Rather you believe that the bank is bigger than the post office by having a belief system according to which, among a great many other things, the bank is bigger than the post office. The key point can be made in terms of maps. A map of the Earth might represent the fact that the taller mountains are mostly near the deeper oceans, but there is no part of the map that says just that in the way that there may be a sentence that says just that - for instance the very sentence ‘The taller mountains are mostly near the deeper oceans’. Or consider holograms. Holograms are ’laser photographs’. When light from the laser is projected through the negative, the well known, three dimensional, coloured array is produced. The negative can be thought of as representing things as being the way the coloured array depicts them. However, no part of the negative has special responsibility for some part of the array. Each part contains

information about the whole array. In consequence, what happens if you damage part of the hologram is a loss of detail, a blurring, of the three dimensional array, not a loss in any particular part of it.

Many of the phenomena explained by LOTH can equally be explained by the map theory. We noted how LOTH can explain the evolution of belief over time in terms of the causal interactions of the internal sentences with each other, and how beliefs cause behaviour in terms of how the stored sentences figure in the causal path to behaviour. But internal maps guide rockets to their targets and evolve over time. The same goes for the maps we use every day - they guide our behaviour and evolve over time. We noted that LOTH can explain the fact that those with the capacity to believe that the bookshop is bigger than the post office are also able to believe that the post office is bigger than the bookshop. But maps (and holograms) that can represent that the bookshop is bigger than the post office can equally represent that the post office is bigger than the bookshop.

It has recently been argued that there is empirical evidence that our brains represent how things are around us in something like the way an internal map or hologram might. This has led to a renewed interest in the map theory of belief (see Connectionism).

The major question for the map theory concerns whether believing is closed under entailment. On the map theory to believe that *p* is to have a system of belief according to which *p*; that is, to have a system that could not be true unless *p*. But if *p* entails *q*, then a system that could not be true unless *p* must also be a system that could not be true unless *q*. This means that the map view must accept closure under entailment, the principle that if *p* entails *q*, anyone who believes *p* believes *q*. But is it not possible to believe that a triangle is equiangular without believing that it is equilateral - as many beginning geometry students know only too well? The usual reply by map theorists is to insist that one who believes that a triangle is equiangular does believe that it is equilateral; what they may lack is knowledge about the right words to capture what they believe. But this is a matter of lively debate.

Belief and knowledge

It is often said that for people to know that such and such is the case, they must have something like a belief that such and such is the case. Call this the 'entailment thesis'. It is usually added that the converse (call it the 'converse entailment thesis') is false: it is false that my belief-like attitude that such and such is the case always counts as knowledge. This standard view, combining the entailment thesis with the denial of the converse thesis, has been challenged in a number of ways.

The 'identity thesis' would retain the entailment thesis but would also endorse the converse entailment thesis. Knowledge and belief entail each other. (While no one has defended precisely this claim, Donald Davidson has come close.) The 'incompatibility thesis' rejects the entailment thesis as well as the converse entailment thesis, and says that knowledge and belief are mutually incompatible. Similarly, the 'separability thesis' also rejects the entailment thesis and the converse entailment thesis, but adds that knowledge and belief are mutually compatible. Those who defend the 'eliminativism thesis' hold that belief, like other elements of 'folk' or popular psychology, is an outmoded notion, and what is 'in our heads' when we know about the world is something other than beliefs.

1 Standard view

Perhaps the most common version of this view is that while some beliefs count as knowledge, not all do. And while epistemologists need to identify the conditions beliefs must meet if they are to acquire the status of knowledge, it is obvious that we cannot know that something is the case if we do not even believe it (see Knowledge, concept of). The common version of the standard view deals specifically with belief states. But some philosophers would claim that while knowledge entails belief-*like* states (but not vice versa), it is not precisely belief states that are entailed. Some of the substitutes that have been defended are psychological certainty, conviction, and acceptance.

A.J. Ayer is among those who say that knowledge entails psychological certainty, where I am psychologically certain that something is the case when I am not at all disposed to doubt it. Psychological certainty is not the same thing as infallibility, and it is only the former that Ayer links to knowledge (see Certainty). His view is based on an analysis of the meaning of the term 'know': according to him, 'to say of oneself that one knew that such and such a statement was true but that one was not altogether sure of it would be self-contradictory' (Ayer 1956: 16).

Keith Lehrer (1974) argued that, given common usage, knowledge need not entail conviction, but that philosophers ought none the less to restrict the use of 'know' so that knowledge does entail conviction. His grounds are that philosophers want to explain how it is possible for people to know what they *claim* to know: if I claim to know something, then I must be convinced that I do know it, but more importantly, I must be convinced that it is the case.

Later (1989) Lehrer retracted. He suggested that we need only to *accept* that something is the case in order to know that it is the case. There are two advantages to this. First, when we accept that something is the case, we do so for a purpose, and the relevant purpose for epistemic agents is the pursuit of truth. When we believe (or harbour a conviction) we need not have any such purpose. So the use of 'acceptance' rather than 'conviction' helps us keep in sight the goal-oriented nature of epistemic agents. Second, a belief (and conviction) can be the product of entirely irrational factors, such as wishful thinking, and one can believe things against one's better judgment. Acceptance, on the other hand, is governed by epistemic norms.

2 Identity thesis

While no one defends the claim that knowledge entails belief and vice versa, Donald Davidson (1983) comes close. He assumes the entailment thesis (that knowledge entails belief), but he also argues that belief is veridical, so that it is impossible for many of our beliefs to be false. Since belief is veridical, most beliefs constitute knowledge. Davidson bases his view that belief is veridical on theories of meaning and belief that appeal to a principle of charity and to a type of verificationism (see Charity, principle of §4; Davidson, D. §5).

First, Davidson assumes that when others interpret what we say, and attempt to figure out what we mean and what we believe, they must do their best to ensure that what we say is intelligible, and that requires that they avoid

ascribing to us very many false beliefs. So it is largely their own beliefs which they must attribute to us. Any interpreter must be *charitable*, and attribute to us beliefs that they consider to be largely true.

Next, Davidson adopts a form of verificationism. He claims that what interpreters of our discourse who are fully knowledgeable of our circumstances and speech behaviour would *say* we mean and believe *is* what we mean and believe. Combining his principle of charity with his verificationism, Davidson reasons as follows: The beliefs of ideally situated interpreters are by hypothesis true. Given their charitableness, when they interpret our discourse it will be largely these accurate views which they will attribute to us. But given verificationism, what they say goes: when they say that what we believe is largely true, they are right. 'Most of the sentences a speaker holds to be true… are true'; 'Belief is in its nature veridical' (Davidson 1983: 434, 432). If I wonder whether my beliefs are true, I have only to run through the above reasoning to see that 'beliefs are by nature generally true' (Davidson 1983: 437). This is not to say that it is impossible for me to believe a falsehood, however, for the ideal interpreter may be forced to attribute to me some false views.

There is plenty of room for doubt about Davidson's argument, however. One challenge made by Luper-Foy (1987) and others is that ensuring that a speaker's discourse is intelligible (which, according to Davidson, is the point of the principle of charity) need not involve attributing to the speaker what in the main we believe. What charitable interpreters, who are out to secure intelligibility, should attribute to speakers is what those interpreters would believe (and mean by what they say) if they were in the speaker's circumstances. Yet this policy might require attributing to speakers mostly false beliefs. For example, people who are in circumstances described by sceptics would be unintelligible to us if their views were not as mistaken as ours would be if *we* were there (see LePore 1986).

3 Incompatibility thesis

Arguments for the thesis that knowledge and belief are incompatible are not very strong. This thesis has been attributed to Plato, who suggested that belief (or opinion) was fallible while knowledge was not, but this suggestion does not imply the incompatibility thesis. People with a (fallible) belief state might also be related to the world in such a way that, given that relationship, their belief could not be false. For example, their (fallible) belief that *p* might be produced by a mechanism that infallibly detects the fact that *p*.

As developed by A. Duncan-Jones (1938), the incompatibility thesis is based on the claim that linguistic evidence precludes our saying that people know something once we have said that they believe it. People say things like 'I do not believe that Clinton is president, I *know* he is', which might suggest that only when we hold an opinion on weak or nonexistent grounds is the opinion a belief, so that belief is incompatible with knowledge. But the linguistic evidence need not suggest this. The evidence is consistent with the possibility that knowledge requires belief and something else, such as strong evidence. To say 'I believe that Clinton is president' when I have overwhelming evidence would be misleading to my listeners, who would assume that if I had overwhelming evidence I would say I *knew* that Clinton was president, not merely that I believed he was president (Grice 1989). Compare: 'I do not *grasp* the theory, I devised it' (see Implicature).

H.A. Prichard (1950) argued that knowledge entails psychological certainty, while mere belief always falls short of certainty. So the confident attitude we have when we know that something is the case rules out (merely) believing that it is the case. However, belief involves some degree of confidence, and surely I can increase my confidence indefinitely without ceasing to believe what I am so confident about.

4 Separability thesis

Perhaps the most prominent defence of the claim that knowledge and belief are separable is given by Colin Radford (1966). A.D. Woozley (1953) had argued that knowledge is compatible with the absence of confidence about what is known, for people who can pass a test prove themselves to know the material even if they are not confident about their responses. Radford uses a similar argument to suggest that knowledge is consistent with a complete absence of belief. Consider the diffident people just mentioned who pass the test. Suppose that they give the correct response 'Washington' to a particular question such as 'Who was the first president of the USA?' If they are sufficiently unconfident about their response, they might be prepared to *deny* that they believe that the first president was Washington, which is strong evidence that they do *not* believe it. Yet their accurate

performance on the test suggests that they knew the truth of their response. (Perhaps it would be inappropriate for them to *claim* that they knew, but that is not because they fail to know; rather, it is because they do not meet the conditions under which it is appropriate to claim knowledge, which would require that they believe that they have the knowledge they claim.)

Radford’s argument can be challenged on various grounds. First, we might point out that we are not infallible authorities about which beliefs we have. Perhaps we think we do not have a belief (say because we cannot detect it through introspection) when in fact we do (say because beliefs are behavioural dispositions such as the tendency to assent when asked the appropriate question) (see Introspection, epistemology of §§1-2). Second, we might deny that the people in Radford’s cases really do know what he claims that they know. After all, they have no evidence for the truth of their test responses; indeed, they have reason to think that their responses are incorrect. So, from their own subjective view, the truth of their responses would be an accident at best.

5 Eliminativism thesis

Patricia Churchland (1986), Paul Churchland (1979) and Stephen Stich (1983) offer a final, and somewhat oblique, challenge to the standard view. They suggest that the notion of belief is scientifically outmoded and ought to go the way of notions like phlogiston and ether. Moreover, theories of knowledge ought to focus on elements of cognition that are more primitive than any belief-like states could be.

Paul Churchland supports the latter point by attacking the common idea that the cognitive apparatus of epistemic agents functions essentially by manipulating sentences, and that rational agents are ones whose apparatus manipulates sentences in accordance with given logical and quasi-logical relations among those sentences. A problem with this common view is that it cannot possibly be true of infants. It is no more tempting to explain the behaviour of infants in terms of propositional attitudes than it is to explain the behaviour of protozoa or plants that way. Their development must be explained in terms of something more primitive than propositional attitudes. But if the rational development of adults is continuous with that of infants, then the rationality of adults must be explained in terms of the same primitives as that of infants.

Eliminativism is sketchy and hence hard to assess as a challenge to the standard view of knowledge. It is not clear what a less ‘folksy’, more scientific psychology would use in place of the notion of belief. It might still need a notion that is very much like the notion of belief, in which case a version of the standard view might survive (see Eliminativism; Folk psychology).

Belinskii, Vissarion Grigorievich (1811-48)

Belinskii was considered by his followers in the nineteenth century, and by the official ideology of the Soviet period, to be not only Russia's greatest literary critic, but also a leading Russian thinker. Soviet encyclopedias label him 'critic, publicist and philosopher'. His role in Russian cultural life has been given positive as well as negative assessments, but there can be no doubt as to his huge influence. He is largely responsible for the fact that Russian literature and art, for a century and a half now, have been considered an organ of society, a mirror of the Russian nation's destiny and a vehicle of its historical progress. It is largely his merit - or fault - that in Russia, art and literature have been accorded a lofty status of leadership and authority, and also that 'art for art's sake' never became respectable in Russia. The influence of Belinskii's philosophy of art extended through the entire political spectrum, far beyond his political legacy which was limited to the revolutionary left. The idea that art and literature are organic functions of society, nationhood and historical progress, which Belinskii took for granted, was passed on even to the Slavophile right and the liberal Westernizing centre. It was still an integral part of the doctrine of Socialist Realism.

1 Life and critical career

Belinskii was born in 1811 in Sveaborg, Finland, the son of a naval surgeon. He attended Moscow University from 1829 to 1832, but was dismissed 'for reasons of health and limited ability'. He was an active member of a discussion group led by Nikolai Stankevich and inspired by the philosophy of J.G. Fichte and F.W.J. Schelling. Among its members were Mikhail Bakunin, Timofei Granovskii and Konstantin Aksakov (see Schellingianism, Russian §1). In 1833 Nikolai Nadezhdin, Belinskii's professor, engaged him as a collaborator of *Teleskop (Telescope)*, a literary journal he had founded in 1831. Belinskii's first major essay, 'Literary Reveries', appeared there in 1834. It was the first of his many surveys of Russian literature and very much under the sway of Schellingian ideas. After the suppression of *Teleskop* in 1836, Belinskii worked, in succession, for *The Moscow Observer* (1838-9), *National Annals* (1839-46) and *The Contemporary* (1846-8). During his only trip abroad in 1847, Belinskii wrote his celebrated 'Letter to Gogol''. He died of consumption in 1848.

During his brief career, Belinskii published a series of annual surveys of Russian literature, scores of major essays and many hundreds of reviews of books on any conceivable subject. Many of his reviews were essays in their own right, for instance, when he would use a book for children as an occasion to expound his views on education. Belinskii correctly recognized every major poet and writer of his age (Pushkin, Gogol', Lermontov, Herzen, Turgenev, Dostoevskii) and dismissed minor lights, even if they were ephemerally successful. He established an approach to literature that saw it as an organic whole of which individual works were a living part.

Belinskii read French, but no other foreign language. However, his friends kept him well informed on recent developments in the West and all the major classics were by then available in Russian translation. Belinskii was reasonably well read in the major authors of the West and regularly responded to recent works of French, English and German literature as they were translated into Russian (Hugo, Janin, Sue, George Sand, Hoffmann, Heine, Walter Scott, Dickens, J.F. Cooper and many others).

2 Evolution of Belinskii's aesthetics

Belinskii's philosophy of art developed under the influence of a series of Western authors, yet always in direct connection with Russian life and the development of Russian literature. Specifically, he experienced, in succession, the stimulating influence of Romantic theories of art and poetry (Fichte, Schelling, the Schlegel brothers); Hegel (after 1837); and the Left Hegelians and French Utopian Socialists (in the 1840s) (see Romanticism, German §§1-3; Hegel, G.W.F; Hegelianism §§1-3).

Belinskii's conception of the organic nature of the work of art (its idea being to its form as soul to body); his notion of the symbolic nature of all true art (along with a dismissal of allegory and schematism as 'nonart'); and his belief in the cognitive power of art and the prophetic powers of genius were derived from Schelling's *System des transcendentalen Idealismus (System of Transcendental Idealism)* (1800). Given in 'The Idea of Art' (1841), Belinskii's famous definition of art as 'the *immediate* contemplation of truth, or thinking in *images*' (1952-9: 584; original emphases), squares with Schelling's: 'Art may be defined as the real representation of the forms of things

as they are in themselves - their proper, native forms, then'. Even more closely, it tallies with A.W. Schlegel's definition of poetry as 'expression of thought in sense images'.

In 1837, Belinskii, along with Stankevich and Bakunin (later his collaborator on *The Moscow Observer*), were converted to a Hegelian philosophy of art and history (see Hegelianism, Russian §§2-3). Specifically, Belinskii used a conspectus of Hegel's lectures on aesthetics, which M.N. Katkov had translated for him. The list of Belinskii's positions that may be derived from Hegel is a long one. As early as 1838, in a major essay on Shakespeare's *Hamlet*, Belinskii wrote of works of art as 'a manifestation of the Spirit, [as] a given stage of its consciousness'. Soon enough he developed a thoroughly historicist approach to literature, following the evolution of the Spirit in concrete historical developments. Concretely, Pushkin's verse epic 'Poltava' (1828) he considered anachronistic and hence a failure, because the age of epic poetry belongs to the past. Also quite concretely, Belinskii observed progress in literature, as Lermontov's Pechorin (in *A Hero of Our Time* (1841)) is perceived as an advance from Pushkin's Onegin (in *Evgenii Onegin* (1830)), while Gogol''s prose represents an advance from the poetry of his predecessors.

During his Schellingian period, Belinskii had been inclined towards Romantic ideas. Under Hegel's influence, his critical thought took a decisive turn to realism. (He called it 'poetry of reality'.) Belinskii's Hegelian historicism caused him to place Russia in the position of an emerging nation, which actually caused him to downgrade the achievement of his contemporaries Pushkin and Gogol', crediting the former with having created the formal tools for a literature of the future, the latter with being the first to deal with Russian life in a constructive way, and denying both international stature. He confidently predicted that Russia would make original contributions to world literature in the future. At the same time, Belinskii overestimated the importance of some Western writers, Walter Scott and J.F. Cooper in particular.

Up to 1840, Belinskii interpreted - or misinterpreted - Hegel's dictum, 'All that is rational is real, and all that is real is rational', to mean that Russians had to reconcile themselves to Russia's all too real backwardness, because it was a necessary stage in the nation's rational development. Later he rejected this notion, realizing instead that it was a Russian's moral duty to work for what was perceived as the rational advancement of Russian nationhood. Belinskii followed Hegel in assuming that the World Spirit realized itself in national spirits. In 1846 he polemicized with the critic Valerian Maikov, who had suggested that progress was proportional to an increase of independence from national ties. A Westernizer, Belinskii was also a Russian patriot.

Hegel's influence shows in some specific details, such as the meaning given to the word 'pathos' ('the rich, powerful individual quality in which the substantial movements of the Spirit are brought to life, achieving reality and expression', as defined in Hegel's *Aesthetics*), as it appears in Russian criticism to this day. Belinskii's conception of an ideal expressed through its negation is clearly Hegelian, for example, when he interprets Gogol''s comedy *The Inspector-General* as the presentation of a 'phantom reality' flowing from the irrational, chaotic principle of life and struggling against the emergence of a positive, rational reality ('Woe from Wit' 1840). Hegelian, too, is Belinskii's resolute rejection of both formalism and naturalism in art.

After 1842 Belinskii began to lean towards a Left-Hegelian or Utopian Socialist position, with an emphasis on *socialité* (*sotsial'nost'*), an overriding concern with social ills and their correction. He now developed the notion that true art is necessarily in step with social progress, in the same sense as he had always taken for granted that art is true to life. Induced by his social and political concerns, Belinskii departed from his previous, Hegelian position that art should be objective and dispassionate. He now suggested that in a 'critical epoch' (a Saint-Simonian term!), such as his own, works with a subjective tendency could play a useful role as catalysts of correct ideas, even if they were not artistically flawless. The practical consequence of this attitude was that Belinskii would now respond approvingly to works he admitted were 'unartistic', but were instrumental in leading the public in the right direction. Such was, for example, Aleksandr Herzen's novel *Whose Is To Blame?* (1847) (see Herzen, A.I. §1).

3 Art and socio-historical reality

Belinskii thus opened the door to didacticism, moralism and political propaganda in Russian literature (art was to follow soon enough, in the *Itinerant* movement). However, he was himself able to discriminate between the aesthetic merits of a given work and its moral and political virtues. In a way, Belinskii would - and did - eat his cake and have it, too, for he could demonstrate, at least to his own satisfaction, that the works which he loved and

respected were, by and large, morally and politically on the right track. When his beloved Gogol' turned reactionary, Belinskii could say, with some justification, that he was no longer the great artist he once was.

Belinskii considered a nation's world of letters (*pis'mennost'*) to be an organic whole, consisting of hierarchically layered, but independent parts: *poesy* (*poėziia*, German *Dichtung*), whose creations of genius reveal the truth of historical progress; *belles-lettres* (*belletristika*) which reduce the insights of poesy to terms readily understood by a broad reading public; and *journalism* (*zhurnalizm*) which applies these insights to the nation's day-to-day concerns.

Belinskii's aesthetic was, like that of his Western influences, an aesthetic of content (German *Gehaltsaesthetik*), meaning that the merits of a work of art were explored proceeding from an analysis of its social, moral, political and historical content, rather than from an analysis of its formal traits (composition, style, language, poetic devices). From the viewpoint of a Kantian aesthetic of form (German *Formaesthetik*), a Belinskiian approach ignores the very essence of art: the expression of aesthetic intuitions through appropriate artistic devices. In 'On the Poet's Calling' (1921), the poet Aleksandr Blok said that Belinskii had done more damage to poesy than Benckendorff, chief of gendarmes under Nicholas I, for the latter's censorship had only temporarily stopped the publication of some works, while Belinskii had induced Russian poets to betray their calling. A negative opinion of Belinskii's role in Russian letters was consistently expressed in the works of the Russian Formalist school of the 1920s (see Russian literary formalism).

The most telling criticism of Belinskii's method came from a radical critic who declared himself to be the master's faithful disciple: Dmitrii Pisarev (1840-68) correctly charged that Belinskii had projected his own humane and progressive ideas into works of 'pure art', such as Pushkin's *Evgenii Onegin*, because he wished to make his own progressive ideas agree with his love of Pushkin.

4 Legacy to Russian aesthetic thought

The generation of 'progressive' critics who claimed to be Belinskii's heirs, like Nikolai Chernyshevskii (1828-89), Nikolai Dobroliubov (1836-61) and Mikhail Saltykov (1826-89), developed the habit of using works of literature as texts for their political sermons (see Russian Materialism: 'the 1860s' §3). Belinskii was to some extent responsible for this practice. He interpreted Gogol''s *Dead Souls* or Dostoevskii's *Poor Folk* as indictments of the ills of Russian society and not as works of art, and therefore failed to see their whole depth, but he did base his observations on the text referred to. Later Chernyshevskii would assert that, inasmuch as all literature was inherently 'propaganda', the only thing that mattered was that it propagate the right ideas; Dobroliubov would often simply ignore the text under review; and Saltykov would merely dismiss as irrelevant works that did not clearly state their ideological position.

From a theoretical viewpoint, the right-wing followers of Belinskii's organic aesthetics, such as Apollon Grigor'ev (1822-64) and Fëdor Dostoevskii (1821-81), were closer to his position. They postulated, like Belinskii, that a true artist who would honestly follow the demands of his craft would *eo ipso* find the right content for his creations. But more unequivocally than Belinskii, they would insist that this agreement between art and the truth of life should be reached on art's terms - not those of ideology.

Belinskii was canonized by Chernyshevskii and Dobroliubov as the first of Russia's revolutionary democrats and as a precursor of the revolutionary movement of the 1860s. This happened largely on the strength of his 'Letter to Gogol'', his correspondence, and oral tradition, for his published writings were of course heavily censored. On balance, Belinskii was less radical than his disciples of the 1860s. He did claim, in his 'Letter to Gogol'', that the Russian people were at bottom atheist and anti-Church, but it is also quite clear from his correspondence and his essays on Russian folklore that he was less inclined to fall prey to a populist mystique than the radicals of the 1860s. He was of course passionately opposed to serfdom, but so were even some officials close to the Tsar. He considered the imperial bureaucracy to be a corporation of embezzlers and extortionists, but this was really an open secret: the Tsar himself had heartily guffawed at the first night of *The Inspector-General*. It appears that Belinskii's involvement with Utopian Socialism was a passing one and that his political vistas were rather down-to-earth. He mentions 'enforcement of existing laws' as a reasonable target in 'Letter to Gogol''.

Bell's theorem

Bell's theorem is concerned with the outcomes of a special type of 'correlation experiment' in quantum mechanics. It shows that under certain conditions these outcomes would be restricted by a system of inequalities (the 'Bell inequalities') that contradict the predictions of quantum mechanics. Various experimental tests confirm the quantum predictions to a high degree and hence violate the Bell inequalities. Although these tests contain loopholes due to experimental inefficiencies, they do suggest that the assumptions behind the Bell inequalities are incompatible not only with quantum theory but also with nature.

A central assumption used to derive the Bell inequalities is a species of no-action-at-a-distance, called 'locality': roughly, that the outcomes in one wing of the experiment cannot immediately be affected by measurements performed in another wing (spatially distant from the first). For this reason the Bell theorem is sometimes cited as showing that locality is incompatible with the quantum theory, and the experimental tests as demonstrating that nature is nonlocal. These claims have been contested.

1 Survey

'Bell's theorem' is the generic name for a family of results that restrict the statistics for a certain type of quantum mechanical 'correlation experiment'. This is the sort of arrangement proposed by Einstein, Podolsky and Rosen ('EPR') (1935), where they argue that either quantum mechanics violates a condition of local causality or it is incomplete (see Einstein, A. §5; Bohr, N.). In the experiment a uniform source emits pairs of 'particles' in a special state. The particles then separate, each moving to a distant wing of the experimental apparatus. The separate wings contain devices that can perform any one of several different 'yes/no' measurements; that is, measurements with just two possible outcomes. For the most economical case suppose that in the 'A-wing' there are two possible measurements A or A' and similarly measurements B or B' in the 'B-wing'.

It is important for the analysis that in a given wing no two measurements can be performed simultaneously (technically, that the quantities being measured are incompatible - like position and linear momentum, or spin components in skew directions). A particular run of the experiment then corresponds to a choice of a single A-wing measurement and a single B-wing measurement, allowing four possible runs: AB, AB', $A'B$ and $A'B'$. From the frequencies of outcomes we can gather statistics that govern these runs. For an AB-run, for example, we can calculate the probability $\mathrm{P}(A)$ that the A-measurement turns up 'yes', the probability $\mathrm{P}(B)$ that the B-measurement turns up 'yes' and the probability $\mathrm{P}(AB)$ that both the A and the B measurements turn up 'yes'. (These probabilities suffice to fix the probabilities for 'no' outcomes as well.) In the same way, for other runs we can determine $\mathrm{P}(A')$, $\mathrm{P}(B')$, $\mathrm{P}(AB')$, $\mathrm{P}(A'B)$, and $\mathrm{P}(A'B')$. The experiment is so designed that $\mathrm{P}(A)$, from an AB-run, is the same as $\mathrm{P}(A)$ from an AB'-run, and similarly for the other single probabilities. By using sufficiently long runs, we should be able to approximate the probabilities experimentally to any desired degree of accuracy. We can also calculate them from the quantum mechanical state function that governs the pairs emitted from the source (see Quantum mechanics, interpretation of §§1-2).

Bell's theorem shows that under certain assumed conditions these probabilities satisfy a restrictive system of inequalities (the 'Bell inequalities') which, for special states of the pairs, are violated by the probabilities of quantum mechanics. The quantum probabilities have been verified to a high degree in various experimental tests and hence the Bell inequalities are violated. There are loopholes in the tests due to inefficiencies in the detection and pairing of results, but the experiments do suggest that the assumptions behind the Bell inequalities are not only incompatible with quantum theory but also with nature. One of the central conditions on which the derivation of the Bell inequalities depends is a species of no-action-at-a-distance, called 'locality': roughly, the condition that the outcomes in one wing are not immediately affected by measurements performed in the other wing. For this reason, the Bell theorem is sometimes cited as showing that locality is incompatible with the quantum theory, or that nature is nonlocal. These claims have been contested (Fine 1997).

2 The Bell inequalities

For the correlation experiment described above the strongest set of Bell inequalities are these:

$$\mathrm{P}(A)+\mathrm{P}(B)-1 \leq \mathrm{P}(AB)+\mathrm{P}(AB')+\mathrm{P}(A'B)-\mathrm{P}(A'B') \leq \mathrm{P}(A)+\mathrm{P}(B),$$

together with the three permutations of this obtained by interchanging *A* with *A*′, *B* with *B*′ and both together. This system has the following purely probabilistic significance. If we are given any four joint probabilities, $\mathrm{P}(AB)$, $\mathrm{P}(AB')$, $\mathrm{P}(A'B)$, $\mathrm{P}(A'B')$, and four 'compatible' singles, $\mathrm{P}(A)$, $\mathrm{P}(A')$, $\mathrm{P}(B)$ and $\mathrm{P}(B')$, (where 'compatibility' here means that, for instance, the probability for *A*-values derived from $\mathrm{P}(AB)$ is the same as the probability for *A*-values derived from $\mathrm{P}(A)$), then the system of Bell inequalities above are the necessary and sufficient conditions for all of the given probabilities to be derivable from one distribution, $\mathrm{P}(AA'BB')$, for all four variables. Put differently, the Bell inequalities are the conditions that the given probabilities can be represented on a classical probability space where all outcomes (even for incompatible measurements) are defined.

These inequalities fail maximally in the case most studied experimentally (for example, by the Aspect experiment that is often cited as decisive (Aspect *et al.* 1982)). Here quantum mechanics assigns 0.5 to all the single probabilities and assigns $\mathrm{P}(AB) = \mathrm{P}(AB') = \mathrm{P}(A'B) = 0.4268$ and $\mathrm{P}(A'B') = 0.0732$. The inequality becomes $0 \leq 1.2072 \leq 1$; and so it fails.

There are also cases where several correlations (represented by the joint probabilities) are strict (that is, 0 or 1); for example, where $\mathrm{P}(AB') = \mathrm{P}(A'B) = 0$, $\mathrm{P}(A'B') \neq 0$ and $\mathrm{P}(A \text{ or } B) = 1$. Although strict correlations are difficult to acheive in practice, Hardy (1993) has shown how to realize these probabilities, in principle, by means of a simple experimental design. Since $\mathrm{P}(A hbox or B) = \mathrm{P}(A) + \mathrm{P}(B) - \mathrm{P}(AB)$, we have that $\mathrm{P}(AB) = \mathrm{P}(A) + \mathrm{P}(B) - 1$ and the left side of the Bell inequality reduces to $0 \leq -\mathrm{P}(A'B')$. Since probabilities are non-negative, this implies that $\mathrm{P}(\mathrm{A'B'}) = 0$, which contradicts the value assigned.

It is easy to construct a rationale for why a contradiction arises here. Because $\mathrm{P}(A'B') \neq 0$, there are runs where B′ yields 'yes'. In these runs if A were measured, then, because $\mathrm{P}(AB') = 0$, A would show 'no'. But if A were 'no' and B were measured, then B would be 'yes', since $\mathrm{P}(A \text{ or } B) = 1$. Hence where B′ yields 'yes', if B were measured instead, then B would yield 'yes'. But where B yields 'yes', A′would show 'no' because $\mathrm{P}(A'B) = 0$. So, where B′ yields 'yes', A′ yields 'no'; contradicting $\mathrm{P}(A'B') \neq 0$.

Clearly this rationale requires strong assumptions to make the counterfactuals along the sequence $B'A \rightarrow BA \rightarrow BA' \rightarrow B'A'$ mesh just right. Each arrow marks a use of locality, but in addition we need further assumptions that allow for transitivity so that we can transfer the *B*′ value from the far left to the far right. Assumptions of 'counterfactual definiteness' (that for each measurement there is an outcome such that if the measurement were made that outcome would result) and of pre-existing values (that each particle in a wing already possess the value - 'yes' or 'no' - that any measurement in that wing would reveal) have been considered. If locality forbids a measurement in one wing from altering the counterfactually definite or the pre-existing values in the other wing, then the stated rationale goes through. Speaking roughly, we can say the Bell theorem rules out the combination of locality plus determinism. If the result of a measurement is not predetermined, however, but is a matter of chance, corresponding to a random choice of 'yes' or 'no', then it is difficult to vindicate the claim that the assigned probabilities alone conflict with locality.

3 Behind the inequalities

In the general case, a standard rationale for the Bell inequalities involves two assumptions. One is an assumption that forbids a distant change in local probabilities. We can call it 'locality'. The other assumption is not related to locality so clearly; it is that there are no basic correlations between the measurement outcomes in the wings. This is 'factorizability' (other names are 'outcome independence' and 'completeness'). A simple framework for these is to consider an elementary sort of hidden variables ('noncontextual') model for a correlation experiment. In such a model, we introduce a set of parameters '*x*' (the hidden variables) that do not depend on any measurements or their results, and let $\mathrm{p}(A, x)$ be the probability at *x* that a measurement of A in the A-wing would produce a 'yes' (similarly for the other single measurements), and let $\mathrm{p}(AB, x)$ be the probability at *x* that both *A* and *B* would yield 'yes' (similarly, again, for the other products). The overall probabilities above (the $\mathrm{P}(A)$, $\mathrm{P}(AB)$, and so on) are to be realized by averaging over the parameters *x*.

Locality is automatically satisfied in this framework since the situation in one wing (that is, the single probabilities assigned at *x*) depend only on the measurement to be performed in that wing and on the particular parameter *x*, which is measurement-independent. (If *x* is measurement-independent violations of locality require that

probabilities at *x* in one wing depend on measurements made in the other wing, so give rise to a representation like $\mathrm{p}(S, x, T)$, where S represents the result of a measurement in one wing and T represents a measurement performed in the other wing. This would be a 'contextual' hidden variables' theory.) *Factorizability* is just the requirement that the joint probabilities factor; that is, that $\mathrm{p}(AB, x) = \mathrm{p}(A, x)\mathrm{p}(B, x)$, which is the condition for stochastic independence at *x* (similarly for the other products). This condition is equivalent to requiring for each parameter *x* that measurement outcomes in the two wings are uncorrelated.

It is straightforward to prove the Bell inequality of §2 from these assumptions provided a third condition is satisfied: namely, that each measurement produces, or is likely to produce, a result. Local, factorizable models can be constructed where this condition fails ('prism' models) and these models can accommodate the quantum probabilities and, so far, the statistics of all the experiments. (This is connected with the efficiency loophole mentioned in §1.) Finally, notice that these hidden variables' models are stochastic so that measurement outcomes are governed by probabilities and need not correspond to predetermined values (whether actual or counterfactual). Thus the Bell theorem here does not depend on determinism. On the other hand, it does not rule out locality alone but only the combination of locality and factorizability (given that the third condition holds).

Locality is an intuitively plausible constraint whose violation would in principle allow one to signal between the distant wings instantaneously, provided one could control the parameters *x*. If those parameters are not controllable, however, and instantaneous signalling is still ruled out, then locality may seem less compelling. (This is the situation in Bohmian mechanics, which is nonlocal but where instantaneous signalling does not occur. See Quantum mechanics, interpretations of §3). The rationale for factorizability is much less clear. It seems to represent a feeling that stable correlations need to be explained and that the only acceptable explanation traces correlations to statistically uncorrelated events. A contrasting point of view might accept some correlations as basic, not themselves in need of explanation, and try to account for others on that foundation.

Considerations about correlations are more pointed when the correlations are strict. Where the probabilities are 0 or 1 the stochastic case become deterministic. Locality then is not about affecting probabilities at-a-distance but about affecting values. So if $\mathrm{P}(AB') = 0$ (as in §2) then there are not just statistics to account for but, arguably, the fact that when a measurement in one wing produces a 'yes' the distant measurement always comes out 'no'. Factorizability becomes the requirement that the value at *x* assigned to the product of physical quantities just be the product of the values at *x* assigned to each quantity separately; using an obvious notation, that $\mathrm{val}(AB') = \mathrm{val}(A)\mathrm{val}(B)'$. This 'product rule' is studied in another theorem (the Bell-Kochen-Specker theorem) where it is shown to contradict quantum mechanics for certain systems, regardless of the state of the system, if the only values assigned are those allowed by the quantum theory. The product rule has been challenged on the grounds that the quantum theory only requires it in certain very special cases (technically, only in eigenstates of the quantities) and that these alone are not sufficient to produce a contradiction. Bohmian mechanics violates the product rule, as do a host of hidden variables' models, and each of these produce the very same statistical predictions as the quantum theory itself.

4 Without the inequalities

Although the Hardy example of §2 violates the Bell inequality, the rationale for why it gives rise to a contradiction does not involve all the machinery that lies behind deriving the Bell inequalities in general. There are other such 'Bell theorems without inequalities'. One set-up, due to Greenberger, Horne, Shimony and Zeilinger (GHSZ) (1990), involves three systems (labelled 1, 2 and 3) in a certain special state. Imagine these as moving away from a common centre along three straight lines in the same plane. For each system we are interested in yes/no quantities that relate to the vertical (*x*) and horizontal (*y*) directions (where *z* is the direction of motion of the system). So, for example, Q_{x_1} is the quantity relating to the *x*-direction for system 1, Q_{y_3} the quantity relating to the *y*-direction for system 3, and so on. Consider an assignment of values to the various quantities where $x_1 = \mathrm{val}(Q_{x1})$, $y_3 = \mathrm{val}(Q_{y3})\ldots$, then if 'yes' is assigned 1 and 'no' assigned 0, the following system of equations hold

$$x_1x_2x_3 = -1\, x_1y_2y_3 = 1 y_1x_2y_3 = 1 y_1y_2x_3 = 1$$

since if we add *Q* to the *x*s and *y*s these four equations give the values prescribed by quantum mechanics for the respective product operators. Since $(x_1)^2 = (y_1)^2 = 1$, if we multiply the first two equations we get $x_2x_3y_2y_3 = -1$. If we now multiply the second two we get a contradiction; namely, $x_2x_3y_2y_3 = 1$.

It is clear that the GHSZ example relies heavily on the product rule discussed in §3, extended here to the product of three quantities. Locality enters in the supposition that the same x_1 occurs in the first two equations; for example, that if x_1 were determined by distant measurements of Q_{x2} and Q_{x3}, and if instead we had measured Q_{y2} and Q_{y3}, then the value of Q_{x1} would not be altered. Similar uses of locality underlie the occurrence of the other terms shared between equations. As in the Hardy example, here too locality needs to be supported by further assumptions in order to justify the manipulations that lead to a contradiction.

In all the cases covered by the Bell theorem, simple-looking arguments that seem to overthrow locality are deceptive. Without question, however, the Bell theorem challenges certain features that one might desire, such as the picture of an observer-independent reality that measurement simply reveals (see Scientific realism and antirealism); it challenges them, that is, provided locality too is assumed.

Benjamin, Walter (1892-1940)

Walter Benjamin was one of the most influential twentieth-century philosophers of culture. His work combines formal analysis of art works with social theory to generate an approach which is historical, but is far more subtle than either materialism or conventional Geistesgeschichte *(cultural and stylistic chronology). The ambiguous alignment of his work between Marxism and theology has made him a challenging and often controversial figure.*

1 Life and works

Benjamin was born into an affluent family of assimilated Berlin Jews. He wrote his doctorate on *Der Begriff der Kunstkritik in der deutschen Romantik (The Concept of Art Criticism in German Romanticism)*, and, in 1925 submitted *Ursprung des deutschen Trauerspiels* (*The Origin of German Tragic Drama*) for the degree of habilitated doctor at the University of Frankfurt. This book is now considered a classic. The application failed, however, and Benjamin abandoned his plans for a university career. After some years as a *feuilleton* journalist in Berlin, during which he met and worked with Bertolt Brecht, Theodor Adorno and other left-wing intellectuals, Benjamin was forced to flee to Paris in 1933. Under commission from the 'Institute for Social Research' (that is, the 'Frankfurt School' then in emigration in New York), he devoted himself to a major theoretical and historical project on nineteenth-century Paris (the 'Arcades Project'). After a financially and personally precarious decade, he was again forced to flee from the Nazis, and eventually took his own life after crossing the Pyrenees in a vain attempt to reach safety in Spain. Benjamin was little known during his lifetime; since 1955, however, under the stewardship of such erstwhile associates as Adorno, his work has been widely published and translated.

2 Art: Nietzsche and Marx

The agenda for modern aesthetic theory was set by Friedrich Nietzsche (§2), who believed that art expressed a realm more fundamental and constitutive than that accessible to the natural sciences. His many followers were happy to invoke such a superior legitimation for the human sciences. They were resisted by Marxists who, while assigning art a place in history, none the less insisted that this history was exclusively political, and that the nature of art was exhausted by determining the side it joined in the political struggle. Art, in other words, was not constitutive even of its own reality, but was merely a 'superstructural' reflection of the political 'base'.

Benjamin inclined by temperament and association towards the Marxists, not least because the most interesting art of the first third of the twentieth century was Marxist, at least by declaration (for example, Soviet Constructivism, Sergei Eisenstein, Brecht and the Bauhaus). It was clear, however, that 'base-superstructure' model of orthodox Marxism could scarcely account for such creativity.

Benjamin's project may be understood as an attempt to uncover the manner in which art engages in spheres describable in the terms of political economy, but autonomously and without adhering to simplistic criteria, such as 'progressive'. By abandoning the Marxist categorization of art as mere epiphenomenal superstructure, then, Benjamin accepts elements of Nietzsche's metaphysics.

3 Symbolism, melancholy and politics

Benjamin's thought runs through two phases. In his earlier work, which included the important essay 'Goethes Wahlverwandtschaften' (Goethe's Elective Affinities) (1922) and culminated in *The Origin of German Tragic Drama*, Benjamin is concerned to explore the manner in which art adopts pragmatic stances. His initial target is what he calls the 'symbolist' approach to art: the view, whether asserted by critics or implied by art works themselves, that art makes magical contact with essential structures of reality. It may issue (as it did with Goethe) in a superstitious fatalism, or (as in certain seventeenth-century dramas) in a naive faith in the capacity of art mimetically to capture God's creation.

Diametrically opposed to this stance is what Benjamin terms 'melancholy', a scepticism about the claims of science and empirical knowledge. The melancholic artist devises allegories and conceits to emphasize their despair at the inaccessibility of God's reality; the Baroque *Trauerspiel* is a typical example of this attitude. However, this is a rash response to the problems of mimetic realism, or 'symbolism', for there is a third possibility available to artists: an interventionist pragmatism. This depends on their ability to perceive their own activities within a wider,

political frame. In Benjamin's view, if they can do this, they will 'awaken under the open sky of history'; but the precise nature of interventionist art is something that, in the early work, still remains obscure.

4 Technology

The latter part of Benjamin's work - from the late 1920s onwards - was concerned to delineate with more precision how art assumes a political identity. This was a matter of describing how art manifested itself in the public arena at all, and how it assimilated itself, deliberately or not, to the conflicts dominating that arena. This discussion has two aspects: the theory of technology and the theory of history.

Benjamin's most important essay on art and technology is 'Das Kunstwerk im Zeitalter seiner technischen Reproduzierbarkeit' (The Work of Art in the Age of its Mechanical Reproducibility) (1935). He argues that there is a general tendency away from the 'auratic'. Under more primitive social conditions, art primarily performs a ritual function, for example, a symbolization of the divinity. It has a high 'cultic' value. This, however, goes hand in hand with low public availability; cultic or auratic works of art retain or increase their power by being confined to inaccessible ritual spaces. In the modern era, despite a decline of express ritual, aura is mimicked by high culture, which favours works that can be restricted to an elite (in museums, concert halls and opera houses).

Because this 'auratic' approach evades the issues of contemporary history, however, it scarcely deserves the designation of culture. Proper art has - indeed, has always had - its vehicles for engaging people in general. These are, nowadays, the instruments of mass dissemination. They have two aspects. In the first place, modern art dispenses with the notion of the unique object, invested with auratic magic. Modern art may be reproduced without losing its identity - as one sees in the case of film and photography and in all electronically storable works. In the second place, art loses its finality; it becomes part of a process of revision, testing and provisional application. Brecht's collaborative and plagiarizing treatment of art is one example; the collective contribution necessary for any movie is another. Because of its provisionality, art becomes subject to the interventions of many; and because of that, in turn, it becomes integrated into wider structures of social dynamics, such as politics.

5 History

The theory of history is the topic of Benjamin's last work, 'Über den Begriff der Geschichte' (On the Concept of History) (1940). Just as his aesthetics break with representationalism of orthodox Marxism, so his notion of history turns away from its characteristic faith in progress. The course of history becomes radically disrupted: that is to say, history is understood as being in a permanent state of emergency, where identities emerge only through isolated and contingent acts of struggle. The 'meaning' of history ceases to be theoretically recoverable, and yields only to redemptive recollection. From this perspective, the task of the historian is to cite those struggles for freedom which, by example or analogy, cast light on the conflicts of the present.

Benjamin represents this view as Messianism and thus as a form of theology. It should be noted, however, that the basic model applies also to common-law notions of legal precedent; this important work is not confined to religious realms, but, as with all of Benjamin's writings, has wide and continuing secular relevance.

Bentham, Jeremy (1748-1832)

Jeremy Bentham held that all human and political action could be analysed in terms of pleasure and pain, and so made comprehensible. One such analysis is how people actually do behave; according to Bentham, seeking pleasure and avoiding pain. Another such analysis is of how they ought to behave. For Bentham, this is that they should maximize utility, which for him is the same as producing the greatest happiness of the greatest number, which, again, is the same for him as maximizing pleasure and minimizing pain. His chief study was planning how there could be a good system of government and law; that is, how laws could be created so that people being as they actually are (seeking their own pleasure) might nevertheless do what they ought (seek the greatest pleasure of all). The instruments which government use in this task are punishment and reward, inducing action by threats and offers. For Bentham, punishment is done not for the sake of the offender, but to deter other people from doing the same kind of thing. Hence on his theory it is the apparent punishment which does all the good, the real punishment which does all the harm.

Bentham thought that the primary unit of significance was the sentence, not the word. He used this idea to produce profound analyses of the nature of law and legal terms, such as' right', 'duty' or 'property'. These are what he calls names of fictions - terms which do not directly correspond to real entities. However, this does not mean that they are meaningless. Instead, meaning can be given to them by translating sentences in which they occur into sentences in which they do not occur. Thus legal rights are understood in terms of legal duties, because sentences involving the former can be understood in terms of sentences involving the latter; these in turn can be analysed in terms of threats of punishment or, again, pleasure and pain. This gives sense to legal rights, but sense cannot be given in the same way to natural rights. For Bentham, we have no natural rights and the rights that we do have, such as property rights, are created by government, whose chief task is to protect them. Bentham also worked out how people could be protected from government itself, designing an elaborate system of constitutional law in which representative democracy was a central element.

Bentham invented the word 'international', and when he died he had an international legal and political influence. His chief influence in philosophy has been as the most important historical exponent of a pure form of utilitarianism.

1 Life and writing

Writing was the centre of Bentham's life. He shut himself away in remote cottages and even when in London described himself as a 'hermit'. Increasingly, the hermit merely produced large sheets of manuscript, and the task of selecting from these and turning them into books was left to others, such as the young John Stuart Mill, who produced five large volumes of Bentham's thought on evidence from a much larger mass of nearly illegible manuscript. When Bentham died he left 70,000 sheets of foolscap manuscript behind him - theoretical work, but also highly detailed designs for states, prisons, banknotes, and much else. His principal writings on language, ontology and the philosophy of law were only published posthumously.

Jeremy Bentham was born in London on 15 February 1748. He was the son and grandson of lawyers and was educated to follow them making money from the practice of law. However he soon became revolted at the current condition of the law and so, instead of making money from it, devoted the rest of his life to a study of how it could be improved. He started to design a perfect penal code; then diverted to write a criticism of the leading current legal thinker, William Blackstone; then diverted again from the main body of this criticism to write a lengthy refutation of one of Blackstone's digressions. This was published as *A Fragment on Government* (1776). He returned to working on the principles of penal legislation and printed the main part of his introduction to them in 1780. However, seeking to work out the identity conditions for a single law, he became entangled in a 'metaphysical maze' which meant that he had to lay the uncompleted book aside. He buried himself away and produced his main work on the philosophy of law, only published a century after his death. The work laid aside was finally published in 1789 as *An Introduction to the Principles of Morals and Legislation*. It had a new preface, but it was neither complete in itself nor accompanied by the worked-out penal code to which it was meant merely to be the introduction.

Since the *Introduction* and the *Fragment* are Bentham's two best known works, it is worth noting that they are

both parts of much larger uncompleted works. The *Fragment* is a fragment, the *Introduction* an introduction, and much of his most profound thought of the time, if it gets in at all, only makes the footnotes. They are also both relatively early works. However they do have the advantage, unlike most of what followed, that they were published by Bentham himself rather than by one of his disciples.

While the *Introduction* lay fallow, printed but not published, Bentham switched into writing in French with the hope of interesting Catherine the Great of Russia in his proposals for legal reform. He visited Russia, where his brother was living, and found a suitably remote cottage. He wrote on the principles of a civil code and of reward. Yet even when Catherine was near, he remained in his seclusion and failed to exert any influence. On his return to England he finally published the *Introduction*. However, it was the year of the French Revolution; public attention was elsewhere; and the work was half consumed by rats. Bentham bombarded the new French revolutionary government with proposals which had no effect beyond his being created an honorary citizen of their new republic. Then, in the chief diversion of his life from writing, he turned his attention to pushing the British government for a contract to build and manage a panopticon prison.

The idea of the panopticon, a circular building in which the unseen overseer in the centre would observe the inmates, derived from Bentham's brother in Russia. At first Bentham wrote about it relatively light-heartedly as a 'simple idea in architecture' which would solve all manners of different problems (such as allowing Turkish seraglios to be run with fewer eunuchs) (Bentham 1791). Editions of the work were printed in Dublin and Paris. A circular prison was built in Edinburgh. However, when Bentham tried to obtain a contract from the British government to manage the country's prisoners, matters became much more serious. He bought the iron and other materials, nearly ruined himself, and energetically lobbied the government for permission to build his 'mill for grinding rogues honest'. Several times in the 1790s it looked as if he would succeed; but the project was effectively over by 1803 (although not completely killed until 1813).

While Bentham was trying to get his panopticon contract, Etienne Dumont was working on his manuscripts. In 1802 Dumont produced the three volumes which first made Bentham's name, the *Traités de législation civile et pénale* (1802). Dumont moved on to editing other Bentham manuscripts, while Bentham returned to full-time production of the supply. In the 1800s Bentham wrote on economics, evidence and judicial organization. In the next decade he expanded into logic, language, ontology, and criticisms of the religious and legal establishment. His central concern became constitutional law. He offered to draft constitutional codes for all nations, and worked hard on the ideal code. This and pamphleteering for a more democratic government were his chief concerns in the 1820s. His reputation was now established. Newly created countries consulted him. Dumont's work was translated into English. A team of disciples produced other work from the manuscript. The *Fragment* and the *Introduction* were republished in second editions. A Benthamite journal was founded. His place in philosophy was secured, his influence being transmitted most of all by J.S. Mill, who was as a young man a great admirer and Bentham editor, and who arranged meetings of the younger utilitarians in Bentham's house. Bentham died in London on 6 June 1832.

2 The principle of utility

Both in the *Fragment* and the *Introduction* Bentham calls his central normative principle the 'principle of utility'. Utility provides the 'standard of right and wrong'. 'By the principle of utility', he says in the *Introduction* (I 2), 'is meant that principle which approves or disapproves of every action whatsoever, according to the tendency which it appears to have to augment or diminish the happiness of the party whose interest is in question'. Utility is therefore to be understood in terms of happiness; and the *Fragment* starts with the famous formula, declared as an 'axiom', that 'it is the greatest happiness of the greatest number that is the measure of right and wrong'. This formula reappears in his late work, and is stated in the *Constitutional Code* (1830), as the proper end of government. In this later work Bentham came to prefer 'the greatest happiness principle' as the best description of his central principle. However, in spite of Bentham's preference, the term 'utility' has stuck, and Bentham is normally thought of as a utilitarian. Indeed the prescient young Bentham dreamed once that he founded a 'sect of utilitarians'.

He founded a sect, but neither utility nor happiness originate with Bentham. They were plucked from the surrounding Enlightenment air. Bentham says that he used 'utility' because of Hume, and the famous 'greatest happiness' formula appears in the Italian legal theorist Cesare Bonesana Beccaria, whom Bentham much admired. Originality was not the point; indeed the more agreed, or hackneyed, the statement of the final goal was, the better.

Bentham's purpose was to work out in detail the means by which this goal could be achieved.

The greatest happiness is therefore the appropriate end of action. The next question is whose happiness. The famous formula says 'of the greatest number'; but this could render the formula indeterminate between recommending that the greatest happiness be achieved and recommending that the greatest number get happiness. In fact Bentham makes it clear that he always means the former: happiness is to be maximized whomever it may belong to. He therefore occasionally recommends omitting the 'of the greatest number' part of the formula, noting that otherwise the slight pleasures of a majority would count more than the severe pains of a minority.

'Pleasure' and 'pain' seem to introduce yet more alternative sources of value. However this promiscuous use of terms does not for Bentham indicate any diversity or conflict of values. For him these terms are all convertible. He says in the *Introduction* (I 3) that 'benefit, advantage, pleasure, good, or happiness' all 'come to the same thing' as also do their opposites, 'mischief, pain, evil, or unhappiness'. 'Interest' is also to be understood in these terms; something is in someone's interest when it tends to increase their pleasure. Bentham's is a monistic and consequentialist system of value. There is only one ultimate value, although it may have different descriptions, and actions should be done so as to bring about those states of affairs which have most of this value.

Bentham usually takes the proper aim of government to be concern with the greatest happiness of the people composing the country for which it is the government. This is less than all the people there are, which is the standard universalistic sense given to the ground principle of utilitarianism. This might be taken as a merely practical recommendation, so that Bentham is still supposed to have universal happiness as his end but is taken to be claiming that this is best achieved if every government restricts itself to maximizing the happiness of its own people. Or it could be taken, as David Lyons (1973) holds, to be explicitly intended by Bentham as a necessary feature of his brand of utilitarianism.

Another claim of Bentham's would, conversely, give his principle a wider scope than the standard utilitarianism. For, as he puts it in the *Introduction* (XVII 4.n), 'the question is not, Can they *reason*? nor, Can they *talk*? but, Can they *suffer*?' So Bentham's utilitarianism goes beyond people and extends to all sentient creatures; animals also count.

In these statements of Bentham's ground principle there is constant use of the word 'tend'. Hence application of them inevitably has a generalizing effect. The precise utilities which follow on a single occasion of action are not as important as the general tendencies of that kind of action.

3 Duty and interest

At the start of chapter one of the *Introduction* (I 1), Bentham says that we are under the 'governance of two sovereign masters, *pain* and *pleasure*', and adds, 'it is for them alone to point out what we ought to do, as well as to determine what we shall do'. Two different things are involved here. On the one hand there is a standard of right and wrong determining what people ought to do. On the other hand there is a psychology of human action determining what they will actually do. Bentham is writing for legislators who have the task of bringing about the goal of maximizing happiness while working with people as they actually are. The legislator needs therefore to understand both the goal and also how people are; both value theory and psychology. These are both treated in the *Introduction*, but much more space is devoted to psychology than to value theory. Its central idea is that people seek their own happiness. Preventing pain and providing pleasure are the ways in which people, as they actually are, can be influenced in their actions.

'The state', says Bentham, 'has two great engines, *punishment* and *reward*' (*Introduction*: XVI 18). This does not mean that they have to be used. Follower of Adam Smith, Bentham realized that the desired end could often be achieved by leaving people alone to get on with their lives. So his chief economic prescription to the legislator is 'be quiet'. He even out-Smithed Smith in an early work, *The Defence of Usury* (1787), arguing against Smith's claim that interest rates should be controlled. However, interference is not ruled out in principle. It all depends upon what is needed to maximize happiness. Bentham was prepared, for example, to allow the control of corn prices in times of starvation; and he believed that relief of extreme poverty should be the concern of the state rather than being left to private charity.

People are moved in many ways. Bentham (1776, 1789) lists the 'sanctions', as he calls them, which operate on

them. The central one he is concerned with, the great engines of punishment and reward, he calls the 'political' (sometimes 'legal') sanction. There is also the 'moral or popular' sanction, which is Bentham's name for public opinion. Then there is the religious sanction, the force exerted by God's displeasure. These are the only ones mentioned in the *Fragment*, but Bentham brings it up to four in the *Introduction* by adding the 'physical' sanction: purely natural processes which influence behaviour (such as the pain of falling out of a window). Later he added the 'sympathetic' sanction, where people are moved merely by the pleasures and pains of others, but which he thinks is much weaker than the others.

If people are going to do the right thing under the operation of one of these other sanctions, the legislator does not need to interfere with them by use of the political sanction. The legislator may, however, seek to strengthen the other sanctions by what Bentham calls 'indirect legislation' - for example, by education. Sometimes, however, more direct action is required. In spite of the non-political sanctions, people seeking their own pleasure sometimes cause greater unhappiness to others and so diminish overall happiness. Then the legislator has to interfere, deploying the political sanction, and threatening punishment. By having a code of criminal law, which announces in advance the kinds of penalties that are attached to particular kinds of behaviour, the legislator changes the payoffs. Self-interested people who might otherwise have done these things are now deterred by the threat of punishment.

For Bentham all punishment is a pain. It is therefore, for him, an evil. Its justification is therefore indirect: it is a present harm done so that good may come (rather like drilling a tooth to prevent future toothache). In fact, as Bentham points out, it is the apparent pain which does all the good, the real pain which does all the harm. So if people could only appear to be punished, this would be even better. Punishment is not done for the sake of the offender, as in retributive theories, but for the future benefit of others. The amount of punishment is accordingly fixed as the minimum amount which is necessary to deter a sufficient number of similar actions by others; it does not depend directly on the seriousness of the offence.

The legislator can only calculate this amount with knowledge of psychology - that is, of how a typical individual calculates the value to themselves of a portion of pain or pleasure. Bentham thinks that the chief factors involved are, in his words, intensity, duration, certainty (or probability), and propinquity. That is, as well as obvious facts like the length or unpleasantness of punishment, the deterrent effect also depends on how imminent the threatened punishment is and how likely someone is to be caught.

Bentham developed this psychology in his *Civil Code* writings (1802), where he laid down what he calls 'axioms of mental pathology' (this is part of the material that was first published by Dumont in the *Traités*). Crucial among these is that equal increments of a good do not produce equal increments of happiness. In other words, the utility produced by goods diminishes at the margin. Therefore, other things being equal, happiness is maximized by an equal distribution of goods.

When Bentham moved on to design of prisons and poorhouses, and eventually to constitutional law, the root idea was similarly to distinguish between the *is* and the *ought* of human action, and then make them work together. The idea is, as he puts it in his work *Pauper Management Improved* 'to make it each man's interest to observe on every occasion that conduct which it is his duty to observe' (II iv. 2), which Bentham calls the 'duty and interest junction principle'. Similarly, the ground idea of the *Constitutional Code* is to construct a system of political offices, such that each office can be occupied by purely self-interested people who will nevertheless be led to behave as they ought to behave if the system as a whole is to deliver good government (that is, promote the greatest happiness).

4 Public reason

Both the prisoners in the panopticon and the guard in the centre will be led to behave well by the force of publicity. Publicity solves the old problem of who is to guard the guards. The same applies in the *Constitutional Code*, where a central role is given to what Bentham calls the 'public opinion tribunal'. Similarly, judges are to be forced to give public reasons for their decisions. This, he thinks, leads to better law.

So far, this is deployment of the 'popular' sanction. 'The eye of the public', as Bentham puts it, 'makes the statesman virtuous' (1843, vol. 10: 145). But it is also centrally connected with Bentham's espousal of his chief evaluative principle. For he thinks that only utility (and its cognates) are appropriate for use in such public justification. In the utility chapter of the *Introduction* (I 2) Bentham allows that 'that which is used to prove

everything else, cannot itself be proved'; but he does add some considerations designed to make people 'relish' the principle of utility. Chief among these is that there would not otherwise be any public standards of justification; anyone's opinions would be worth just as much or as little as anyone else's; and this would be 'despotical' if someone imposed them, 'anarchical' if not. In other words, unless all argument is to be 'at an end', utility must be taken as the standard. Only utility can be used in public reasoning.

Bentham puts this as a way of giving a 'meaning' to 'the words *ought*, and *right* and *wrong*, and others of that stamp' (I 10). His concern, here and elsewhere, is to give meaning; to clarify; to make things comprehensible. The chief justification of his foundational evaluative principle is that, by connecting *right* and *wrong* with pleasure and pain, it gives them public meaning.

5 Fiction and paraphrasis

Bentham carries his clarificatory mission into the centre of the law. His aim is that the central legal terms, such as 'right', 'duty', or 'property', should be understood. To make something clear for Bentham is to connect it with perception. These legal terms are names of what he calls fictional entities; and fictional entities are understood by connecting them with perceivable real entities like pleasure and pain.

For terms like 'duty' or 'obligation' Bentham invented the technique he called *paraphrasis*, most fully described in his *Essay on Logic*. For Bentham the primary unit of meaning is the sentence rather than the word, and he uses this insight to relate the tricky legal terms to perception. They do not themselves refer to things that can either be perceived or directly inferred from perception. However, Bentham's proposal is that if the difficult term is placed in a sentence, the whole sentence may then be given meaning by being translatable into another sentence the words of which can be more easily understood.

Armed with his technique of paraphrasis, Bentham accordingly analyses fundamental legal terms. Rights, for example, are analysed in terms of duties. That is, a sentence about rights, such as ‘John has a right to wear his coat', can be translated into a sentence about duties, such as ‘Everyone has a duty not to prevent John wearing his coat'. We are now still in the realm of fiction. But Bentham proceeds to the analysis of duty. Someone is said to be under a duty when they are threatened by punishment for non-performance. But the threat of punishment is the threat of pain. So, at last, we reach pain, an immediate object of experience; the law has been clarified and made comprehensible to all. As he puts it in the Preface to the *Fragment*, '*pain* and *pleasure*, at least, are words which a man has no need, we may hope, to go to a Lawyer to know the meaning of'.

For Bentham, rights are the benefits created by the imposition of duties. He analyses the varying kinds of rights according to the different kinds of duties, and in an embryonic deontic logic brings out the different connections between obligation and permission. Thus analysis of fictions (such as Bentham conducts in his *Of Laws in General* (1970)) gives clarification. The point of calling them 'fictions' is not to designate them as merely imaginary items which can be disregarded. Such things (ghosts; the pagan gods) Bentham calls, by contrast, 'fabulous' entities. Legal rights and obligations have what he calls a 'verbal' reality, and the paraphrastic analysis shows what this consists in: if I disobey a (verbally real) obligation, then I am liable to real pain.

Bentham holds that fictions are necessary for the use of language, yet he also sometimes uses 'fiction' in a merely pejorative way to stigmatize something as merely imaginary; so care has to be taken as to which use he intends on a particular occasion. He is being merely pejorative in the *Fragment* when he talks of the supposed original contract, which was meant to justify political obligation, as the 'sandy foundation of a fiction', or when he talks of 'pestilential breath of Fiction' poisoning the operations of law. In these cases he is talking about what he calls the lies of lawyers - of justification on the basis of purely imaginary happenings.

Bentham's account of natural rights illustrates both his techniques of analysis and this problem. 'From *real* laws come *real* rights', he says, 'from *imaginary* laws come imaginary ones' (*Anarchical Fallacies*, conclusion). Natural rights are just fictions. But, it might be objected, since all rights are fictions for Bentham, why can natural rights not also be given a meaning by paraphrastic analysis? The answer is as follows. Since (sentences about) rights can be analysed in terms of (sentences about) duties, the problem is not with natural rights, as such. They can be analysed in terms of natural duties. The problem is with the next step, where duties are analysed in terms of threats of pain (punishment). With the supposed natural duties there is, for Bentham, no such threat. There is no legislator. As he puts it in *Supply without Burthen* (1795), ‘a natural right is a son that never had a father' (1952,

vol.1: 334).

For Bentham, people talking of natural rights are really saying that they wished that there were (real, political) rights. But, as he says, 'want is not supply; hunger is not bread'. Even worse, for him, is when people suppose, as did the framers of the French *Declaration of the Rights of Man and of the Citizen*, that such rights are unalterable (impresciptible). As Bentham famously puts it, 'natural rights is simple nonsense, natural and impresciptible rights, rhetorical nonsense, nonsense upon stilts' (*Anarchical Fallacies* art. II).

6 Government

So, in Bentham, for real rights we need real laws. We need government. The argument for the states and for government is therefore straightforward: they confer the benefits we gain from the possession of rights. Of these benefits the chief, for Bentham, is security; and hence the principal task of government is to provide for the security of individuals. Possessing security, they can plan ahead in confidence, realize their plans, and increase their happiness. Bentham's main concern is to protect areas in which individuals may maximize their own utilities rather than having a government that constantly interferes to promote happiness. In this sense he is on the side of liberty - although this is a liberty which is only produced by government and does not predate it in the way that supposed natural liberty would.

Property is included by Bentham under security. Again, it is the creation of law and does not predate it. This means that Bentham avoids the problems about taxation or obedience to the state which philosophers run into when they start with natural rights to property. With John Locke we get an original contract argument for government, whereby people antecedently having property contract into government. Bentham mocks such arguments in the *Fragment*. For him justification of obedience is a matter of utilitarian calculation, of whether the 'probable mischiefs of obedience are less than the probable mischiefs of resistance' (I 43). Analogously, there are no problems about taxation. Government creates property and it can remove the property it creates.

As well as security, Bentham lists three other 'subordinate ends' of government in the *Civil Code*: subsistence, abundance, and equality. The utilitarian argument for equality was noted above; and both subsistence and abundance are naturally positively correlated with utility. They are therefore appropriate goals for the legislator, although it should be noted that this emphasis upon subordinate ends shows Bentham's indirect utilitarian aspect: the legislator protects security or provides subsistence rather than directly promoting utility. Security easily outranks the others, being thought by Bentham a necessary condition for their achievement.

When Bentham was writing the *Civil Code* he was happy to appeal to enlightened dictators to get his legal proposals put into effect. However he came to realize that the chief power against which people need security is the power of government itself. Hence his turn in his later writings to the construction of a constitutional code; and hence also his turn to democracy.

The argument for democracy follows simply from the central principles outlined above. Since, by the principle guiding human action, people tend to act in their own interest, so also do governors. Kings look after the interests of kings; oligarchs after the interests of the oligarchy; and so on. Yet the proper end of government is not just a sectional but a general interest. It is general happiness. The solution is to make the governors as far as possible the people themselves. The greatest happiness of the greatest number is safest in the hands of the greatest number. Merely by following their own interest, in accordance with the chief factual principle, they will also promote the general interest, in accordance with the chief evaluative principle.

The kind of democracy promoted is representative democracy. Bentham distinguishes between 'constitutive' and 'operative' powers. The people as a whole are to be the supreme constitutive power, electing governments and having final authority. But they elect, and can dismiss, the operatives. The operatives have to be controlled. Hence the *Constitutional Code*. As before, the guards are to be guarded. Politicians are to be forced by all the available sanctions so that, acting merely selfishly, they in fact promote general happiness.

Bentley, Richard (1662-1742)

A towering figure in the history of textual criticism, Bentley's importance in the development of English philosophical thought rests on both public and private achievements. His great public contribution was made in the first Boyle lectures of 1692. In private, his correspondence with Newton sought the great man's blessing on the arguments and opinions advanced in these lectures, persistently questioning him on the possibility of a natural origin for the universe and on the role and nature of gravity in physics in general. Bentley's influence helped to establish the Newtonian consensus dominant in Europe until the end of the nineteenth century.

Richard Bentley was born into an English family of modest means in Oulton, Yorkshire. He entered St John's College, Cambridge in 1676. He later came under the patronage of Bishop Stillingfleet and served as tutor to his family. He took holy orders, his scholarly eminence resulting in a rapid rise to the post of Keeper of the Royal Libraries and election to the Royal Society in 1694. For an advocate of religion as a source of peace and concord, Bentley managed to provoke a great deal of acrimony. A famous dispute with Oxford scholars regarding the relative merits of the Ancients and the Moderns led to his great work of textual criticism - *Dissertation on the Epistles of Phalaris* - demolishing the claims to authenticity of the epistles of 'Phalaris'. In 1699 he became Master of Trinity College, Cambridge, a post he retained until his death. His despotic rule was not to the liking of the Fellows, whose unsuccessful efforts to remove him involved two trials before the Bishop of Ely.

The annual courses of lectures endowed by Robert Boyle became the main public forum for the exposition and defence of the Newtonian world picture as a basis for latitudinarian natural religion (see Latitudinarianism). Bentley gave the first series in 1692. The picture of a rationally ordered universe, in which the designing and maintaining hand of God could be discerned, was presented as a model for a rationally ordered social universe, providentially arranged for our delight and wellbeing. This happy state of affairs would be much facilitated, Bentley implied, if we followed the teachings of the Anglican 'broad church' party. According to Bentley (1692 vol. 3: 13), 'Religion itself gives us the greatest delights and advantages even in this life also, though there should prove in the event to be no resurrection to another'. It is significant that Bentley entitled his lectures *The folly and unreasonableness of atheism* (1692).

Bentley singled out gravity as peculiar evidence of the direct and arbitrary action of a wise creator. In an exchange of letters he pressed Newton on the role of gravity in the origin of the universe as we now observe it, and the possibility of a purely mechanical explanation of the origin of the material world. In his response of 10 December 1692 to Bentley's first letter Newton expresses a firm commitment to the principles of natural religion: 'I had an eye,' he says 'upon such Principles as might work with discerning men for the belief of a Deity' (Turnbull 1961). Bentley realized that the clumping of matter into discrete material bodies out of a primeval atomic chaos by any natural force, such as universal gravity, was implausible when the extremely low density of such a state was considered. Newton's first response was to distinguish between the general problem of the condensation of matter and particular difficulty of the separation of 'shining' matter into stars and 'opaque' matter into planets, without, as he says, the work of 'a voluntary Agent'. Bentley expressed his general point as follows: 'No Quantity of common Motion could ever cause those straggling Atoms to convene into great masses' (Letter of 18 February 1692); so there could be no natural explanation for the origin of the solar system. This provoked Newton's famous reply: 'Gravity must be Caused by an Agent acting constantly according to certain laws, but whether that agent be material or immaterial I leave to the consideration of my readers' (Letter of 25 February 1692). We can hardly doubt what he expected their opinion to be!

Of all Newton's followers it was above all Bentley and Samuel Clarke who made the Newtonian point of view available to an extensive lay audience, and, indeed created the Newtonian consensus which dominated English and later Continental thought for more than a century.

Berdiaev, Nikolai Aleksandrovich (1874-1948)

Nikolai Berdiaev, Russian religious idealist, was one of many non-Marxist thinkers expelled from Russia by communist authorities in 1922. Although attracted to Marxism in his youth, even then he tempered it with a Neo-Kantian ethical theory. Well before the Bolshevik Revolution, he became seriously disenchanted with Marxist philosophy (though not with the idea of socialism) and embarked on the career of elaborating a personalistic Christian philosophy that occupied him for the rest of his life.

Dubbed 'the philosopher of freedom', Berdiaev wrote prolifically on that subject and on related topics in metaphysics, philosophy of history, ethics, social philosophy and other fields (but not epistemology, which he rejected as a fruitless exercise in scepticism). Because his approach to philosophy was admittedly anthropocentric and subjective, he accepted the label 'existentialist' and acknowledged his kinship with Dostoevskii, Nietzsche and (to a lesser degree) Jaspers. Like them, he constructed no philosophical system, though he did expound views that were coherently interrelated in the main, if impressionistically and sometimes obscurely expressed. Among his more prominent ideas were his conception of freedom (for which he was indebted to the mystical philosophy of Jakob Boehme), his distinction between spirit and nature, his theory of 'objectification', his doctrine of creativity and his conception of time.

The most frequently translated of twentieth-century Russian thinkers, Berdiaev has been widely studied in the West since the 1930s, particularly in schools of religion and theology and by philosophers in the existentialist and personalist traditions. Although many Western readers considered him the voice of Russian Orthodox Christianity, his independent views drew fire from some Orthodox philosophers and theologians and also from strongly anti-Soviet Russian émigrés. His writings in emigration were eagerly embraced in his homeland once they could be published there, beginning in the late 1980s.

1 Life and works

Nikolai Aleksandrovich Berdiaev was born into an aristocratic family in 1874 near Kiev. A student of law at the University of Kiev, he was expelled in 1898 for his activity in radical student circles; this marked the end of his formal education, except for a semester of study with Wilhelm Windelband at Heidelberg in 1903. In 1900 Berdiaev, along with other members of the Social Democratic Party in Kiev, was banished to the northern province of Vologda. Philosophically, like many Russian thinkers of his generation, the young Berdiaev sought to complement Marxist socioeconomic views with Kantian transcendental idealism, and this effort is evident in his first philosophical book, *Sub''ektivizm i individualizm v obshchestvennoi filosofii (Subjectivism and Individualism in Social Philosophy)* (1901).

Allowed to return to Kiev in 1903, Berdiaev moved in the following year to St Petersburg and in 1908 to Moscow, where he became prominent in the lively cultural world of Russia's 'Silver Age'. The first decade of the century was a period of intense spiritual searching for Berdiaev as for many others; under the influence of a great range of thinkers, including Schopenhauer, Nietzsche, Vladimir Solov'ëv, Vasilii Rozanov, Fëdor Dostoevskii, Lev Tolstoi and Dmitrii Merezhkovskii (see Russian Religious-Philosophical Renaissance), he moved from Neo-Kantian Marxism (though without abandoning his socialist convictions, as we shall see in §5) to the religiously oriented, mystically coloured personalism that he would continue to elaborate throughout his life. His writings of the period 1907-11 may be considered transitional. It was not until 1916, in *Smysl tvorchestva (The Meaning of Creativity)* (his last philosophical book published in Russia), that Berdiaev provided a comprehensive account of the chief principles of his new worldview. This work, which Berdiaev in his autobiography called his most significant book, exhibits the impact of a major influence on his mature outlook - the mysticism of Jakob Boehme.

Berdiaev welcomed the Russian Revolution of February 1917, but he was opposed to the policies of the Bolsheviks, who seized power in October. Despite that opposition, he was able to take an active part in the cultural life of Moscow during the first years of communist rule. In 1919 he founded the Free Academy of Spiritual Culture, and in 1920 was named Professor of Philosophy at Moscow University. In 1922, however, Berdiaev and more than 100 other prominent non-Marxist intellectuals were abruptly stripped of their positions and required to leave the country, prohibited from returning on pain of death.

After a stay in Berlin, in 1924 Berdiaev with his family joined the growing Russian émigré community in Paris. He taught at the Russian Religious-Philosophical Academy there, an institution he had first organized in Berlin with the assistance of the Young Men's Christian Association (YMCA) of North America; he founded and edited (1925-40) the religious-philosophical journal *Put' (The Way)*; and he served as editor-in-chief (1924-48) of the YMCA-Press in Paris, the principal publishing outlet for émigré Russian religious philosophers.

Berdiaev won worldwide fame with his book *Novoe srednevekov'e (The New Middle Ages)* (1924), which was translated into a dozen languages. He continued to develop various aspects of his philosophical outlook in many subsequent books, also widely translated, until his death in 1948 at his home in Clamart, a suburb of Paris.

2 Metaphysics

In keeping with his existentialist orientation, Berdiaev defines 'metaphysics' not as the study of reality in general but as 'the philosophy of human existence', and he contends that this philosophy is not 'objective' but 'subjective'. In calling it subjective he means to indicate both that its focus is the subject and that it is not a sphere of demonstrable, impersonal truth. 'Truth and reality', he writes, 'are not identical with objectivity' ([1937b] 1952: 17). Yet, as this statement itself indicates, he does not reject truth or reality, and his worldview, however subjectively conceived, is in fact phrased as a general theory of reality for which truth is implicitly claimed. This theory was set forth most fully in his 1947 book, *Opyt ėskhatologicheskoi metafiziki (An Essay in Eschatological Metaphysics)*.

Berdiaev was willing to call his doctrine a form of dualism, but not a dualism of idea versus matter or divine versus human. Rather, he opposes *dukh* ('spirit', both divine and human) to *priroda* ('nature') or *byt'ë* ('being'), although he also frequently uses the latter word to signify reality in general. Spirit is the realm of freedom, personality and creative activity; nature is the realm of necessity, objects, routine and passivity. Berdiaev likens this dualism to the Kantian distinction between noumena and phenomena: the spiritual (noumenal) realm has primacy over the realm of nature (the phenomenal realm), in that it alone is truly 'real' and fully independent of the other (see Kant, I. §3). Unlike Kant, however, Berdiaev did not regard the world of spirit as unknowable (except for the ultimate mystery of the one perfect spirit, God); he considered it accessible through intuitive - essentially, spiritual and mystical - experience, which is the only true foundation for a philosophical system. Rational knowledge of the world of 'nature', on the other hand, is 'objective' knowledge, which has no philosophical value.

Berdiaev links God, human spirits and the objectified world of nature in a philosophical cosmology based on a controversial interpretation of the Christian idea of divine creation *ex nihilo*. Drawing on Boehme's mystical doctrine of the primitive *Ungrund* ('the groundless') that underlies all reality (see Boehme, J.), Berdiaev contends that the 'nothing' out of which God creates the world is not sheer emptiness but a positive potentiality, which he also calls 'meonic freedom' - a volitional, irrational, formless, creative potency or energy that is metaphysically prior not only to the world but to God the creator. God creates himself out of this irrational freedom, overcoming it in his own nature through his perfection. But in proceeding to create human beings out of the *Ungrund* as well, he produces creatures whose irrational freedom is neither generated nor controlled by him. Thus when humans misuse their freedom by choosing evil, God is not implicated in the choice; indeed he does not even have foreknowledge of it. Berdiaev valued this doctrine as providing an explanation of evil within a theistic philosophy; but for abandoning the metaphysical primacy and the omnipotence and omniscience of God, he was severely criticized by Russian philosophers who adhered more closely to traditional Orthodox theological doctrine.

The ability of the free human spirit to choose evil is also invoked by Berdiaev in his idealist account of the genesis of nature. The realm of objects is produced not by God but by the fallen human subject: 'the subject is the creation of God while the object is the creation of the subject' ([1947] 1952: 17). The proud individual subject, intoxicated by freedom, creates the world of exteriority by separating itself from God and other spirits. The subject engages in what Berdiaev calls 'objectification' (*ob''ektivatsiia*) - a process of self-alienation in which a spirit gives itself and others an objectified form as part of a system of external substances and relations. Characterized by division, disintegration, materiality and necessity, this system functions to enslave the very subject that created it. Although Berdiaev frequently speaks of this objectified world of nature as phenomenal - a realm of 'appearances' - he also calls it ontologically real, albeit of a lower order of reality. By this he apparently means that nature, once created by the objectification of spirit, is truly 'objective' as an independently subsisting force, not simply an imaginary

one. He regards the overcoming of objectification in the name of freedom as the daunting but imperative task of the human spirit.

3 Philosophy of history

Human history, as Berdiaev explains it (primarily in *Opyt ėskhatologicheskoi metafiziki* and in his 1923 *Smysl istorii (The Meaning of History)*), is a temporal process connected with the creation and conquest of objectification. History begins with the Fall. The dividedness or exteriority of the objective world that is generated by the sinful use of human freedom is manifested not only spatially but temporally, in the separation of past, present and future. The flow of time in the objective world may be viewed in two ways, according to Berdiaev: either cyclically, as an endless repetition of natural processes operating independently of human thought or action (he calls this *cosmic* time, symbolized by a circle), or linearly, as an unrepeatable succession of events involving human agency (this is *historical* time, symbolized by a line).

Berdiaev argues eloquently against interpreting the historical process as progressive, for ‘progress’ as he understands it signifies that existing generations of people are regarded simply as means for improving the lot of those to come. Berdiaev used this moralistic, Kantian condemnation of the idea of progress (anticipated by his Russian predecessor Nikolai Fëdorov) to great effect in his attack on Russian communism as a quintessential case of treating existing human beings as raw material for the production of a better future. At the same time, Berdiaev’s philosophy is strongly eschatological, and he argues that history would be meaningless if it had no termination and if objectification were not overcome. In his eyes the ultimate horror, adding moral crime to meaninglessness, would be a conception of history as *endless progress* - the perpetual instrumentalization of one generation after another with none ever becoming an end in itself.

The ‘end of history’, or conquest of objectification, postulated by Berdiaev takes place not in historical time but in time of still a third type, which he calls *existential*. This is the time of the free, creative act, and he symbolizes it by a point; it is durationless and integral. The creative act in existential time manifests itself as essentially an irruption of ‘meta-history’ into history, of the spiritual plane of eternity into the objectified world of historical time. One such irruption of great significance was the Incarnation, but in fact every creative act at any historical moment in the ‘divine-human’ process of redemption is a victory of spirit over nature and freedom over necessity. Berdiaev incorporates in his eschatology such traditional Christian concepts as the Kingdom of God, paradise, hell, universal resurrection (it must be universal, or some persons would not be valued as ends in themselves) and immortality, but in keeping with his notion of existential time he interprets these concepts as referring not to future events or conditions but to timeless and purely spiritual presences. Paradise and immortality are accessible to the creative spirit at any (historical) moment.

Berdiaev’s reasoning concerning the overcoming of objectification through creativity appears to be that since the succession of events in historical time is itself a product of objectification, the annulment of the latter cannot be considered an event in that succession but must occur in another temporal dimension - the extrahistorical dimension he calls ‘existential’. But this conception raises further questions that Berdiaev does not answer unequivocally. Commentators on his philosophy are divided as to whether the ‘overcoming’ of objectification requires that historical time literally come to an end or simply that it be rendered insignificant. In either case, if the ‘end of history’ is located outside historical time, that would appear once again to deprive history *per se* of meaning.

4 Ethics

The issue of the impact of creativity on the world is encountered once again in Berdiaev’s personalistic ethics, which ascribes supreme value to the individual spirit and identifies moral action with the creativity that combats and ultimately defeats the objectification produced by the Fall. His mature ethical views were first suggested in *Smysl tvorchestva* and were developed most fully in his widely read book *O naznachenii cheloveka (On the Destiny of Man)* (1931).

Berdiaev distinguishes three stages in the development of moral consciousness, each of which gives rise to a corresponding type of ethics. Earliest and lowest but still most widespread is the ethics of *law*, which subjects individuals to abstract norms of behaviour in the name of social order. Morality at this pre-Christian level is

negative and impersonal, and it is based on the distinction between good and evil - a distinction that is itself part of the objectification created by the Fall. Berdiaev concedes that the ethics of law is a social necessity in a fallen world, but argues that it is far from adequate to the developed moral consciousness.

A higher, Christian stage is marked by what Berdiaev calls the ethics of *redemption*, which speaks to the individual rather than the group and offers as its standard of value not an abstract law but the figure of a loving, all-forgiving saviour. This ethics of Christian love correctly acknowledges the Incarnation and redemption as elements in divine creation and in the transfiguration of the objectified world. But it, too, is flawed, according to Berdiaev: it can degenerate into 'transcendental egoism', an exclusive concern for one's own salvation.

The highest stage of the moral consciousness is reflected in the more advanced Christian ethics of *creativity*, in which human beings, as free spirits, transcend the good-evil distinction through unique and unrepeatable acts that bring novelty into the world. In responding freely in this way to God's command to overcome evil, the individual person becomes a co-creator of the universe. Human creators are 'beyond good and evil' in the sense that they, undetermined by social standards or any other form of objectification, define the moral sphere through personal decisions. At this highest level, morality and creativity are effectively coextensive for Berdiaev: 'the moral act is a creative act [and]… all creation has moral significance, even if it is the creation of cognitive or aesthetic values' ([1937b] 1952: 20-1). 'The creator is justified by his creative achievement' ([1931] 1935: 130).

To the critic who would charge Berdiaev with Nietzschean egoism here, he responds that it is precisely in creative acts that individuals are the most selfless, since all energies are focused on the acts and their products. Berdiaev denies, too, that the genuine creator would seek to wound or dominate other people: the free person recognizes that no one should be treated as a mere means. This continued appeal to the Kantian principle, however, suggests that Berdiaev is, after all, admitting a universal moral law to which individuals must conform - a suspicion furthered by his acceptance of 'conscience' as 'the organ of perception of the religious revelation, of goodness, righteousness and truth in its entirety' ([1931] 1935: 167). Berdiaev is also criticized for 'deifying' human beings; Sergei Levitskii (1975) and Piama Gaidenko (1994) argue that in glorifying human powers Berdiaev is forgetting the gulf that separates flawed and finite humanity from divine perfection.

The most widely debated feature of Berdiaev's philosophical outlook is the redemptive value he attributes to creativity in its dual capacity of giving meaning to history and expressing the highest morality. In both contexts, the value of creativity hinges on its effectiveness in overcoming objectification. But inasmuch as human creators are concerned with their 'products' and must operate in the external world (Berdiaev acknowledges that, unlike God, they require material other than 'meonic freedom'), they cannot escape the dead hand of objectification: 'every expression of creative action in the external [world] falls into the power of that [objectified] world' ([1939] 1943: 127). Thus, in the 'irruption' of existential time into historical time, creativity participates in the succession of historical events and is enmeshed in the very objectification it sets out to avoid. Berdiaev himself calls this situation 'tragic': 'It is the tragedy of creativeness that it wants eternity and the eternal, but produces the temporal and builds up culture which is in time and a part of history' ([1931] 1935: 136). V.V. Zenkovsky (1948-50) and some other critics contend that on Berdiaev's principles the creative act is not merely tragic but meaningless and futile; Fuad Nucho (1966) and others reply that creativity retains spiritual value despite its tragic character.

5 Social and political philosophy

Berdiaev's first book (1901) was devoted to social and political philosophy, and the subject figures prominently in virtually everything he wrote, including his last, posthumously published book, *Tsarstvo dukha i tsarstvo kesaria (The Realm of Spirit and the Realm of Caesar)* (1949b). In most of his mature works dedicated to the subject, such as *Filosofiia neravenstva (The Philosophy of Inequality)* (1923a), the critique of Russian communism is a principal concern. Two works - *The Origin of Russian Communism* (1937a) and *Russkaia ideia (The Russian Idea)* (1946) - include extensive critical discussion of the history of Russian social and political thought.

In using the term 'nature' for the world of objectification opposed to spirit, Berdiaev does not mean to exclude *social* factors from the objectifying forces that enslave personality; indeed, it is the objectifying power of society above all that he sees as a threat to freedom. He protests against the depersonalizing processes in which the self is moulded by objectified social relationships and comes to be considered a part of society rather than an independent bearer of value. The great error of Marxist communism and all forms of collectivism is that they view humanity as

simply a product of society, determined by social laws, and consequently have no regard for personal freedom. As early as 1906, Berdiaev predicted that the Bolshevik Party in Russia would produce a society united by force, ruled by an unlimited and ‘deified’ state (1906: 536).

At the same time, Berdiaev believed that individualism is as much a threat to personality as collectivism is, since setting the person *apart* from others is no less a form of objectification. In this regard Berdiaev retained what he called ‘a soft spot’ for Marxism; he shared Marx’s abhorrence of ‘bourgeois’, capitalist society as alienating and dehumanizing. A critic of the free market economy and of claims to an absolute right of private ownership, Berdiaev at times found points of agreement with Soviet ideology; in entertaining (especially during and immediately after the Second World War) the possibility that Soviet rule might become more benign, he incurred the wrath of much of the Russian émigré community.

In opposition to both collectivism and individualism, Berdiaev offered his own ‘personalistic socialism’ - a form of free sociality having much in common with the older Russian ideal of *sobornost’* (see Slavophilism §3). Personality, as a spiritual category, he argues, is not only free but universal, and as such it is inherently social in the sense of requiring others for its fulfilment. To achieve the fullness of personal being, the individual must be in communion with other individuals, where ‘communion’ signifies a complete but fully voluntary union based on love. It is in this essentially spiritual sense of ‘socialism’ that Berdiaev can affirm that a Christian not only may but must be a socialist.

Berdiaev’s hostility towards all established (‘objectified’) social arrangements - whether totalitarian or democratic - prevented him from spelling out ‘personalistic socialism’ beyond such broad descriptions of its aim as ‘a synthesis of the aristocratic, qualitative principle of personality with the democratic, socialist principle of justice and brotherly cooperation’ ([1937b] 1952: 20). The state as such appears to have no role in effecting such a synthesis, for Berdiaev views every political structure as an impediment to the realization of personality; he expresses no preference, for example, for a constitutional state based on the rule of law over a totalitarian state. Because he regards the state and law as essentially parts of the objectified world that must be vanquished, his political philosophy amounts to a form of anarchism.

List of works

Berdiaev’s principal works are listed here in order of their initial publication; since 1988 most of them have been reprinted in Russia, many with new editorial commentary and some in more than one edition.

Berdiaev, N. [Berdyaev] (1901) *Sub’’ektivizm i individualizm v obshchestvennoi filosofii. Kriticheskii ėtiud o N.K. Mikhailovskom (Subjectivism and Individualism in Social Philosophy: A Critical Study of N.K. Mikhailovskii)*, St Petersburg: Popova.(Berdiaev’s first book, in which he sought to complement Marxist socioeconomic views with Kantian transcendental idealism.)

Berdiaev, N. [Berdyaev] (1906) ‘Sotsializm, kak religiia’ (Socialism as Religion), in *Voprosy filosofii i psikhologii (Problems of Philosophy and Psychology)* 85: 508-45; trans. M. Schwartz, in B.G. Rosenthal and M. Bohachevsky-Chomiak (eds), *A Revolution of the Spirit: Crisis of Value in Russia, 1890-1924*, New York: Fordham University, 1990, 107-33.

Berdiaev, N. [Berdyaev] (1907) *Novoe religioznoe soznanie i obshchestvennost’ (The New Religious Consciousness and Society)*, St Petersburg: Pirozhkov.

Berdiaev, N. [Berdyaev] (1911) *Filosofiia svobody (Philosophy of Freedom)*, Moscow: Put’.

Berdiaev, N. [Berdyaev] (1916) *Smysl tvorchestva. Opyt opravdaniia cheloveka (The Meaning of Creativity: An Essay in the Justification of Man)*, Moscow: Leman & Sakharov; trans. D.A. Lowrie, *The Meaning of the Creative Act*, New York: Harper & Bros, 1955. (Berdiaev’s last philosophical book in Russia.)

Berdiaev, N. [Berdyaev] (1923a) *Filosofiia neravenstva. Pis’ma k nedrugam po sotsial’noi filosofii (The Philosophy of Inequality: Letters to Opponents on Social Philosophy)*, Berlin: Obelisk; trans. C. and A. Andronikof, *De l’inégalité*, Lausanne: Éditions l’Age d’Homme, 1976.(A critique of Russian communism.)

Berdiaev, N. [Berdyaev] (1923b) *Smysl istorii. Opyt filosofii chelovecheskoi sud’by (The Meaning of History: An Essay in the Philosophy of Human Destiny)*, Berlin: Obelisk; trans. G. Reavey, *The Meaning of History*, London: Geoffrey Bles, 1936.

Berdiaev, N. [Berdyaev] (1924) *Novoe srednevekov'e. Razmyshlenie o sud'be Rossii i Evropy (The New Middle Ages: Reflections on the Destinies of Russia and Europe)*, Berlin: Obelisk; trans. D. Attwater, *The End of Our Time*, New York: Sheed & Ward, 1933.(The book which won Berdiaev worldwide fame.)

Berdiaev, N. [Berdyaev] (1927-8) *Filosofiia svobodnogo dukha. Problematika i apologiia khristianstva (Philosophy of the Free Spirit: Christianity's Problems and Apologia)*, Paris: YMCA-Press, 2 vols; trans. O. Clarke, *Freedom and the Spirit*, London: Geoffrey Bles, 1935.

Berdiaev, N. [Berdyaev] (1931) *O naznachenii cheloveka. Opyt paradoksal'noi ėtiki (On the Destiny of Man: An Essay in Paradoxical Ethics)*, Paris: Sovremennye zapiski; trans. N. Duddington, *The Destiny of Man*, London: Geoffrey Bles, 1935.(Here Berdiaev's mature ethical views are developed most fully.)

Berdiaev, N. [Berdyaev] (1934) *Ia i mir ob''ektov. Opyt filosofii odinochestva i obshcheniia (The Self and the World of Objects: An Essay in the Philosophy of Solitude and Community)*, Paris: YMCA-Press; trans. G. Reavey, *Solitude and Society*, London: Geoffrey Bles, 1938.

Berdiaev, N. [Berdyaev] (1937a) *The Origin of Russian Communism*, trans. R.M. French, London: Geoffrey Bles. (Originally published in translation; the Russian text was first published in 1955 as *Istoki i smysl russkogo kommunizma (The Sources and Meaning of Russian Communism)*, Paris: YMCA-Press.)

Berdiaev, N. [Berdyaev] (1937b) 'Die Philosophische Weltanschauung N.A. Berdiaeffs (Selbstdarstellung)' (The Philosophical Worldview of N.A. Berdiaev (Self-Exposition)), in *Philosophen-Lexicon: Handwörterbuch der philosophie nach personen*, Berlin: Walter de Gruyter; repr. in *'Berdiaeff, Nicolei'* (1949) 1: 102-8, ed. W. Ziegenfuss; 1st Russian edn, 'Filosofskoe mirosozertsanie N.A. Berdiaeva (Avtoizlozhenie)' in *Vestnik Russkogo studencheskogo khristiankogo dvizheniia* (1952) 4/5: 15-21.(A text, first published as a German translation, in which Berdiaev summarized his own views in an unusually systematic fashion.)

Berdiaev, N. [Berdyaev] (1939) *O rabstve i svobode cheloveka. Opyt personalisticheskoi filosofii (On Slavery and the Freedom of Man: An Essay in Personalist Philosophy)*, Paris: YMCA-Press; trans. R.M. French, *Slavery and Freedom*, London: Geoffrey Bles, 1943.

Berdiaev, N. [Berdyaev] (1946) *Russkaia ideia. Osnovnye problemy russkoi mysli XIX veka i nachala XX veka (The Russian Idea: Basic Problems of Russian Thought of the Nineteenth and Early Twentieth Centuries)*, Paris: YMCA-Press; trans. R.M. French, *The Russian Idea*, London: Geoffrey Bles, 1947.(Includes extensive critical discussion of the history of Russian social and political thought.)

Berdiaev, N. [Berdyaev] (1947) *Opyt (skhatologicheskoi metafiziki. Tvorchestvo i ob''ektivatsiia (An Essay in Eschatological Metaphysics: Creativity and Objectification)*, Paris: YMCA-Press; trans. R.M. French, *The Beginning and the End*, London: Geoffrey Bles, 1952.(Sets forth a general theory of reality.)

Berdiaev, N. [Berdyaev] (1949a) *Samopoznanie. Opyt filosofskoi avtobiografii (Self-Knowledge: An Essay in Philosophical Autobiography)*, Paris: YMCA-Press; trans. K. Lampert, *Dream and Reality*, London: Geoffrey Bles, 1950.(Because of abridgment and other editorial changes, the English translation is untrustworthy; translations into many other languages exist.)

Berdiaev, N. [Berdyaev] (1949b) *Tsarstvo dukha i tsarstvo kesaria*, Paris: YMCA-Press; trans. D.A. Lowrie, *The Realm of Spirit and the Realm of Caesar*, London: Gollancz, 1952.(Social and political philosophy figures prominently in Berdiaev's last, posthumously published book.)

Bergson, Henri-Louis (1859-1941)

So far as he can be classified, Bergson would be called a 'process philosopher', emphasizing the primacy of process and change rather than of the conventional solid objects which undergo those changes. His central claim is that time, properly speaking and as we experience it (which he calls 'duration'), cannot be analysed as a set of moments, but is essentially unitary. The same applies to movement, which must be distinguished from the trajectory it covers. This distinction, he claims, solves Zeno of Elea's paradoxes of motion, and analogues of it apply elsewhere, for instance, in biology and ethics.

Bergson makes an important distinction between sensation and perception. He repudiates idealism, but claims that matter differs only in degree from our perceptions, which are always perfused by our memories. Perception free from all memory, or 'pure' perception, is an ideal limit and not really perception at all, but matter. Real perception is pragmatic: we perceive what is necessary for us to act, assisted by the brain which functions as a filter to ensure that we remember only what we need to remember. Humans differ from animals by developing intelligence rather than instinct, but our highest faculty is 'intuition', which fuses both. Bergson is not anti-intellectualist, though, for intuition (in one of its two senses) presupposes intelligence. He achieved popularity partly by developing a theory of evolution, using his élan vital, *which seemed to allow a role for religion. In ethics he contrasted a 'closed' with a (more desirable) 'open' morality, and similarly contrasted 'static' with 'dynamic' religion, which culminates in mysticism.*

1 Life

Bergson was born in Paris on 18 October 1859 with a musician as father and a mother from Yorkshire. He married Louise Neuberger, a relative of Proust, and had one daughter. After teaching in Angers, Clermont-Ferrand and Paris, he held a chair at the Collège de France from 1900 to 1921, where his lectures before the First World War attracted so many people that it was seriously proposed to move them to the Opéra. After the war, interest in his lectures declined and he turned from academic teaching (though only partly from writing) to promoting international understanding as a prophylactic against war. Fiercely patriotic, he died at France's darkest hour on 3 January or 4 January 1941, after seventeen years of crippling arthritis, and after supporting his fellow Jews by refusing an offer of exemption from anti-Semitic regulations; the same sympathy may have stopped him officially adopting the Catholic religion, to which in later life he became spiritually close (despite having his books placed on the Index in 1914).

Bergson was a man of wide intellectual attainments. At seventeen he won first prize in an open mathematical competition and also solved a problem left unsolved by Pascal. His subsidiary degree thesis (written in Latin) dealt with Aristotle on place, and he lectured on Lucretius. He devoted several years to a detailed study of the literature on aphasia, in connection with memory, and similarly used detailed scientific evidence to support his views on evolution. He was also a great stylist and his books can stand beside those of Berkeley, Russell and the early Plato as among the more readable works of philosophy.

2 Time and duration

The core of Bergson's philosophy, which, as he pointed out in a letter of 1915 (1972: 1148), every account of his philosophy must start from and constantly return to, on pain of distortion, is the 'intuition of duration'. Time, for Bergson, is of two fundamentally different kinds, or better, especially for his later philosophy, appears in two fundamentally different guises. For science, time is essentially particulate. It consists of an infinite, dense set of instants, and science uses the calculus to study the world as it is at these instants. Change is nothing over and above the world's being in different states at different instants, and the transition from one state to another is something science can take no account of except by using the calculus in this way. (This interpretation of the role of the calculus for Bergson has been disputed: see Milet 1974.) For experience, however, this transition is the very essence of time, now called duration (*durée*). We do not live from moment to moment, but in a continuous stream of experience (the similarity to William James' 'stream of consciousness' is unsurprising, given the close personal and professional friendship between Bergson and James, who reached their views independently).

One might wonder why change should not consist simply in being in different states at different instants, provided

the instants form a dense set, so that no two are adjacent (a feature Bergson unfortunately ignores in his favourite image of time as cinematographic). Bergson's reply, that this overlooks the phenomenology of experience, surely has merit, and helps to solve several problems. We experience the immediate past, and possibly the immediate future, along with the present, as actual, and we can perhaps avoid objections that have confronted James' independently developed 'specious present' if (with Bergson) we avoid treating the act of experiencing as itself separate and momentary. But be that as it may, Bergson can avoid Augustine's problem that time vanishes because only the present is actual and the present does not last long enough to be real at all. He also need not worry about how we acquire a concept of the past when experience only ever presents us with the present.

However, problems do arise. Duration is introduced as essentially linked to consciousness; but does duration exist in the outer world? Bergson's first major book *Essai sur les données immédiates de la conscience (Time and Free Will)* (1889) states unambiguously that it does not, but his next book *Matière et mémoire: Essai sur les relations du corps avec l'esprit (Matter and Memory)* (1896) does allow duration to the outer world, as do his later works. The change of view was well motivated, for how could a consciousness embedded in duration live in a world devoid of it? Science still treats the world as cinematographic, and so now falsifies it, but inevitably and harmlessly, so long as we do not expect from science more than it can give; it is for metaphysics, using 'intuition', to describe the world philosophically, but only science can give us our indispensable practical understanding of the world. Bergson, however, never seemed conscious of a real change of view, and in his much later *La pensée et le mouvant: essais et conférences (The Creative Mind)* (1934) talks simply of *Matter and Memory* as getting nearer to what he wanted to say. Nor did he ever satisfactorily explain the extent to which duration is bound up with consciousness.

Bergson's treatment of time and duration invites comparison with McTaggart's B-series and A-series respectively. McTaggart wrote in 1908, after Bergson's main treatments, but Bergson's later writings show no knowledge of him. In McTaggart's terms Bergson would be a thoroughgoing A-theorist, especially from *Matter and Memory* onwards (see McTaggart, J.M.E. §2).

Discrete plurality for Bergson is essentially spatial, and time with its multiplicity of moments is duration spatialized. This contrast between space and genuine time (duration) introduces an asymmetry between space and time which puts Bergson at odds with recent philosophy (which tends to treat them alike), and assimilates him in this respect to older philosophers such as the Greeks. One of his favourite examples for illustrating duration is a melody, which we can only hear as a melody if we hear it as a whole. Critics have pointed out that, similarly, we can only see a circle by seeing it as a whole (Boudot 1980: 349), and have claimed that in order to distinguish space and time Bergson uses a distinction between the psychological and the mathematical that applies within space and time equally (Berthelot 1913: 354-5). The critics are somewhat justified, though Bergson does in a lower key distinguish space from extensity, and could perhaps thereby deal with the circle. But the critics do scant justice to the real asymmetries between space and time in terms of directions and 'flow' which support Bergson's general approach (see Time §1).

3 Bergson and Zeno

The ideas so far outlined provide Bergson with a tool which he uses first to deal with Zeno's paradoxes of motion, but then goes on to apply in other spheres, such as biology and ethics. This tool is the distinction between a movement and its trajectory. The reason that Zeno's Achilles never overtakes his tortoise is that Zeno insists on applying to the movement, which occurs in time, the infinite process of division that really only applies to the trajectory, which is spatial (see Zeno of Elea §7). The movement is essentially unitary and indivisible. This gives the spirit of Bergson's views, though only as a rough approximation: evidently Achilles' movement does have parts - his steps - and it is these that have no parts. But Bergson never seems to succeed in giving adequate criteria for deciding just when a movement is unitary and so has no parts.

The use of this tool in other spheres begins with the treatment of free will in *Time and Free Will*, where it joins a sort of dialectical device that Bergson repeatedly employs: the insistence that two antagonistic approaches that together dominate a philosophical topic share a common error, though he often admits that his own view lies nearer to one pole than to the other. On free will, the poles are determinism and libertarianism, and the error, as so often, amounts to replacing a movement by its trajectory. Bergson's own view, that a free act will proceed from the self alone and 'express the whole of the self' ([1889] 1990: 165-6), is nearer to libertarianism, but the

libertarian, insisting that the agent ‘could have done otherwise’, shares with the determinist the view that the trajectory is already there before the action and that it makes sense to imagine a replay, stopping the action halfway through, as it were, and sending it off on a different course. His point seems to be that there is no ‘halfway through’ at which the action could be stopped; the process flowing from deliberation to completed action (the doing, as opposed to the things done) is unitary and indivisible (see Free will §1-2).

4 Process philosophy

Process philosophy is a philosophical tradition which goes back as far as Heraclitus, and if Bergson can be placed in any tradition, it is in this, despite his repudiation of allegiance to Heraclitus. Process philosophy stands in opposition to the tradition stemming from Aristotle’s scheme of categories, where the world consists of substances which have properties and undergo change. For process philosophy the world consists of processes, and Bergson often says things like, ‘There are changes, but there are underneath the change no things which change… movement does not imply a mobile’ ([1934] 1946: 173). Objects are like ‘snapshots’ of a flux, which is duration. This echo of the cinematographic approach of science illustrates another feature of Bergson: his pragmatism. He does not deny that language (itself a pragmatic device for dealing with the world) uses the Aristotelian apparatus of subject and predicate, but we see the world in terms of objects which change because that is the only way we can act in it, just as science gives us our only way of manipulating it.

5 Metaphysics and philosophy of mind

This pragmatism appears again in Bergson’s philosophy of mind, which, as we might expect from the way in which he links duration to consciousness, is itself closely linked to his metaphysics. He repudiates idealism, and begins the introduction to the 1911 edition of *Matter and Memory* by calling himself a dualist, ‘affirming the reality of spirit and the reality of matter’. But his dualism is not ‘vulgar’. It can be called a dualism of time and space (it is tempting to call it one of movement and trajectory), but from another point of view it could be called one of perception and memory, terms which he constantly contrasts as differing in kind, not in degree.

But though matter and spirit are both real, they differ only in degree, and here we reach a central part of Bergson’s metaphysics, and also his epistemology, for our knowledge of the world is essentially bound up with the nature of the world itself. Bergson is one of the few philosophers to distinguish clearly between sensation and perception. We cannot start with sensations, treated as unextended and inside ourselves, and somehow turn them into perceptions telling us of an extended outer world, just as we cannot get a concept of the past by starting from a momentary present, and treating memories simply as weaker (‘fainter’, as Hume would say) sensations or perceptions. Bergson’s target here is the associationism that underlies so much of eighteenth- and nineteenth-century empiricism, and his criticisms are of fundamental importance, whether or not his own view also faces difficulties.

Although officially dualist, Bergson’s view is somewhat akin to the ‘neutral monism’ of William James and others (see James, W. §6; Neutral monism). Though perception differs in kind from memory, it essentially involves it in varying degrees. Our perceptions are always affected by our experience, and if we had no memories we would have no real perceptions - another important criticism of Humean empiricism. Perception takes place not inside us but where its object is, and a perception unmediated by memory, and in that sense a ‘pure’ perception, is an ideal limit, and not really perception at all; it ‘is really part of matter’. In effect it is the object itself, or rather, since it now lacks duration, it is what we might now describe as a momentary time-slice of the object.

Bergson’s pragmatism reappears here: we perceive what we need to perceive in order to act (we might think this more obviously true in the case of animals), and the function of the brain is to filter memories so that only those enter consciousness which are of practical use, notably in perceiving; he used his study of aphasia to argue that the brain cannot be used as a storehouse for memories. Superficially, his treatment of memory involves an excessively crude dichotomy between picture-memory and habit-memory, but he was not concerned with many of the problems that interest later thinkers.

6 Humour

Le rire: essai sur la signification du comique (Laughter: An Essay on the Meaning of the Comic) (1900), probably Bergson’s most popular book, can be seen as an appendix to his philosophy of mind and body. For him, a human

being is a creature who is both body and spirit (to avoid too intellectual a term: see §7) and uses its body for practical purposes. But sometimes the body takes over and we act as though we were simply a body, either obeying only physical laws - when we slip on a banana-skin, for instance - or when our actions become wooden, mechanical, automatic or stereotyped. It is then that others laugh at us and we have the makings of comedy, low or high. Bergson also gives laughter a function, as a social corrective (his target has something in common with Sartre's 'bad faith'). 'A humorist is a moralist disguised as a scientist' (1900: 128).

7 Science and metaphysics: the *élan vital*

Bergson distinguishes three cognitive faculties: intelligence, instinct and intuition. As evolution has advanced, animals and humans have diverged and developed instinct and intelligence respectively as their tools for confronting the world. These are equally suited for their tasks, intelligence being extensible but hazardous, while intuition is limited but safe. Bergson uses detailed scientific evidence to illustrate the remarkable achievements of which instinct is capable. Intuition is a development of instinct, mediated by intelligence, which occurs only in humans but takes them to their highest level, and is the faculty used by metaphysics to say what reality is really like, while science uses intelligence to study reality in a manner inevitably distorted - but essential for practical living. But 'intuition' is ambiguous in Bergson. In one sense it turns quantity into quality, and, for example, enables us to see trillions of vibrations as the colour red, and experience duration; metaphysics uses it to study life and spirit. But in another sense it is insight, the getting of bright ideas, which both presupposes and is essential for the development of intelligence.

On evolution, Bergson again claims that two antagonistic theories, Darwinian mechanism and finalism or teleology, share a common presupposition, that the path or trajectory of evolution is somehow already laid out. His own view involves his famous *élan vital* ('vital impetus', usually left untranslated) which drives evolution on, though not towards any pre-ordained goal. It drives rather than draws, and to that extent resembles mechanism, but it also overcomes obstacles - a puzzling idea if it has no goals. Perhaps Bergson is here taking up a stance nearer to one extreme (teleology) than to the other, evolution having intermediate goals but no overall goal.

8 Morality and religion

Bergson turned to morality, and to an explicit discussion of religion, late in life in his last major work, *Les deux sources de la morale et de la religion (The Two Sources of Morality and Religion)* (1932). On both topics he uses a dualistic framework, but not, as in previous works, to show how two antagonistic approaches share a common premise. He contrasts closed morality with open morality and static religion with dynamic religion, and in each case his preference for the second term is unambiguous. The open morality is one of aspiration rather than impulsion and is universal in scope. Dynamic religion is somewhat similar, culminating in mysticism, of whose nature and development he gives an extended account. Obligation he sees as the pull of instinct against the waywardness introduced by intelligence, and he rightly emphasizes that we perform the great majority of our obligations as a matter of course and without any heroic Kantian struggle. The contrast between trajectory and movement is used twice here. Just as we can never build up a movement out of elements of its trajectory, but must treat it as something distinct and unitary, we can never construct a motive for moral action from individual intellectual considerations: the motive must already be there, given by instinct (there are echoes of Hume here). The second point is that we can never pass from ever-expanding group loyalties, which always require some out-group as a foil, to the universal love of mankind that open morality demands and that only the mystic can provide.

Berkeley, George (1685-1753)

George Berkeley, who was born in Ireland and who eventually became Bishop of Cloyne, is best known for three works that he published while still very young: An Essay towards a New Theory of Vision (1709), Three Dialogues between Hylas and Philonous (1713), and in particular for A Treatise concerning the Principles of Human Knowledge (1710). In thePrinciples he argues for the striking claim that there is no external, material world; that houses, trees and the like are simply collections of 'ideas'; and that it is God who produces 'ideas' or 'sensations' in our minds. The New Theory of Vision had gone some way towards preparing the ground for this claim (although that work has interest and value in its own right), and the Dialogues represent Berkeley's second attempt to defend it. Other works were to follow, including De Motu (1721), Alciphron (1732) and Siris (1744), but the three early works established Berkeley as one of the major figures in the history of modern philosophy.

The basic thesis was certainly striking, and from the start many were tempted to dismiss it outright as so outrageous that even Berkeley himself could not have taken it seriously. In fact, however, Berkeley was very serious, and certainly a very able philosopher. Writing at a time when rapid developments in science appeared to be offering the key to understanding the true nature of the material world and its operations, but when scepticism about the very existence of the material world was also on the philosophical agenda, Berkeley believed that 'immaterialism' offered the only hope of defeating scepticism and of understanding the status of scientific explanations. Nor would he accept that his denial of 'matter' was outrageous. Indeed, he held that, if properly understood, he would be seen as defending the views of 'the vulgar' or 'the Mob' against other philosophers, including Locke, whose views posed a threat to much that we would ordinarily take to be common sense. His metaphysics cannot be understood unless we see clearly how he could put this interpretation on it; and neither will we do it justice if we simply dismiss the role he gives to God as emerging from the piety of a future bishop. Religion was under threat; Berkeley can probably be judged prescient in seeing how attractive atheism could become, given the scientific revolution of which we are the heirs; and though it could hardly be claimed that his attempts to ward off the challenge were successful, they merit respectful attention. Whether, however, we see him as the proponent of a fascinating metaphysics about which we must make up our own minds, or as representing merely one stage in the philosophical debate that takes us from Descartes to Locke and then to Hume, Kant and beyond, we must recognize Berkeley as a powerful intellect who had an important contribution to make.

1 Life

George Berkeley was born in (or near) the town of Kilkenny, Ireland, and educated at Kilkenny College and at Trinity College, Dublin, where he took the degree of B.A. in 1704, and that of M.A. in 1707, becoming a Junior Fellow in the latter year. Before long he published the books for which he is now most renowned. However, mention must first be made of two notebooks, now known as the *Philosophical Commentaries*, which he filled during the years 1707-8. Since their first publication in 1871 (but more particularly since it was established that they had at some stage been bound together in the wrong order, thus giving a distorted picture of the development of Berkeley's thought) these have proved an invaluable resource for scholars seeking to understand the evolution of his thinking during this crucial period. The major fruits of that thinking were *An Essay towards a New Theory of Vision* (1709), *A Treatise concerning the Principles of Human Knowledge* (1710) - which was originally intended to be merely Part I of a three- or four-part work- and the *Three Dialogues between Hylas and Philonous* (1713), which Berkeley published after he had moved to London. In between the *Principles* and *Dialogues* he published a slighter work, *Passive Obedience* (1712), which gives the main insight into his thinking on ethics, and on the basis of which he has been described as a theological rule-utilitarian. Also dating from about this time there are essays published in Richard Steele's *Guardian* during the year 1713, which evidence his disdain for the antireligious sentiments of the 'free-thinkers'.

From this time onwards, Berkeley's life was active and interesting. He made two continental tours, the first (1713-14) as chaplain to Lord Peterborough, during which he apparently met Malebranche, and the second (1716-20) as tutor to George Ashe, son of the Bishop of Clogher. Towards the end of the second tour he wrote the Latin tract *De Motu* for submission to the Royal Academy of Sciences at Paris, which had offered a prize for an essay on the cause of motion. He published this in 1721, returned to Ireland in the same year, and was appointed Dean of Derry in 1724. Already, however, he had conceived a remarkable project that was to dominate his life for

ten years. During the spring of 1722 he resolved to found a college on the island of Bermuda, and before long he set about soliciting support for and gaining a charter for St Paul's College, which would, had it come into existence, have educated a number of young Native Americans, as well as the sons of English planters.

In fact he never reached Bermuda but, newly married, he set sail for Rhode Island in 1728, where he stayed for over two years awaiting a promised government grant, and where his house is preserved as a monument to him. The grant never materialized, so there was to be no college, either in Bermuda or, as he had come to think would be preferable, on the mainland. His time in Rhode Island was not, however, wasted. While there he wrote *Alciphron: or the Minute Philosopher*, an attack on atheism and deism in dialogue form, which was published in 1732, the year after his return to London. He also became a friend of Samuel Johnson, later the first president of King's College, New York. Johnson's *Elementa Philosophica* (1752) is dedicated to Berkeley, and two letters from Johnson written in 1729 and 1730 (published with Berkeley's replies in volume two of the standard edition of Berkeley's *Works*) reveal that he was basically sympathetic to, but also an acute critic of, Berkeley's main metaphysical doctrines.

Certainly the same could not be said of Andrew Baxter, who in 1733 included as part of his *Enquiry into the Nature of the Human Soul* what was, in fact, the first extended critique of Berkeley's *Principles*. Baxter's tone was hostile throughout. Berkeley chose not to respond, though in the same year he did answer an anonymous critic of the *New Theory of Vision* - a third edition of which had been annexed to *Alciphron* - by publishing *The Theory of Vision, Vindicated and Explained*. He also published a revised edition of the*Principles* and *Dialogues* in 1734. *The Analyst* (1734), which criticizes Newton's doctrine of fluxions, also relates to his earlier work in that Berkeley refers back to his observations on mathematics in the *Principles*, and it may be that remarks Baxter had made on his treatment of the mathematicians there played at least a minor role in encouraging him to publish it. Berkeley does not name the critic who, he says, had challenged him to 'make good' what he had said in the *Principles*, but if it was Baxter he treats him dismissively as someone who 'doth not appear to think maturely enough to understand either those metaphysics which he would refute, or mathematics which he would patronize' (*The Analyst* §50).

However, Berkeley also had to think about securing his and his family's future, and his efforts to gain preferment in the church were rewarded in 1734 when he was appointed Bishop of Cloyne in Ireland. There, he thoroughly earned the reputation he has had ever since as 'the good Bishop'. The tangible legacy includes *The Querist* (1735-7), which evidences his concern for the economic wellbeing of Ireland, and *Siris* (1744), so successful at the time that it went through six editions in the year of publication but which is now regarded as little more than a curiosity. However, this was to be his last original publication of any substance. He remained in Cloyne almost to the end of his life, moving to Oxford, where one of his sons was to study, in the summer of 1752. He died there in the following year.

2 Influences

The primary influence on Berkeley is unquestionably John Locke, whose *Essay concerning Human Understanding* Berkeley had studied as an undergraduate and continued to dwell on afterwards. The long introduction to Berkeley's *Principles* is for the most part a sustained attack on the view that we can frame abstract ideas, focusing on Locke's account of abstraction. Illegitimate abstraction is ultimately blamed for the supposedly untenable distinction between primary and secondary qualities, the belief in 'material substance', and the view that objects have an existence distinct from 'ideas', all of which are features of Locke's position (see Locke, J. §§2-5). Yet Berkeley also owed a great deal to Locke whom he likened in the notebooks to 'a Gyant' and who should be seen as his mentor as well as one of his philosophical targets. It is therefore understandable that Berkeley has most often been seen as the second of the three great British Empiricists, as successor to Locke and precursor of Hume, these three being placed in opposition to the three great Rationalist philosophers, Descartes, Spinoza and Leibniz. Certainly, it would be tempting to say that the importance of Locke's influence on Berkeley could hardly be overestimated, were it not for the fact that it sometimes has been.

If only as a corrective, then, it is important to stress that while it is evident that Locke was often in Berkeley's mind as he formulated his own position, and while there is no doubt that none of Berkeley's major works would have existed in their present form had Locke never published the *Essay*, Berkeley would have insisted that much more was at stake than whether Locke got things right. He targeted certain views and assumptions that were very widely held. Thus Locke is the only philosopher he actually identifies and quotes from in the attack on abstract

ideas, but even there he sees himself as opposing, not simply some quirky view of Locke's, but one which, as he put it in a letter, 'Mr. Locke held in common with the Schoolmen, and I think all other philosophers' (*Works*, vol. 2: 293). These certainly included Malebranche, for example, who, Berkeley elsewhere complained, 'builds on the most abstract general ideas' (*Works*, vol. 2: 214). Again, when he says that 'Some there are who make a distinction betwixt *primary* and *secondary* qualities' (*Principles* §9), he really does mean 'some', and not just Locke; and the same could be said of his opposition to the notion of 'material substance'. In short, Berkeley often had his eye on other thinkers too, and some of these must also count as influences. As is now widely recognized, these included writers in the Cartesian tradition, most notably Malebranche but also probably Pierre Bayle.

The relationship between Berkeley and Descartes is interesting - after all, it was Descartes who had introduced a radical dualism of 'matter' and 'mind', and although Berkeley rejected matter, he adhered to a broadly Cartesian view of the mind (see Dualism). However, Malebranche is particularly important in the story, both because Berkeley had studied his *De la recherche de la vérité* at an early stage, and because Berkeley's position struck many as remarkably close to that of Malebranche. In particular, Berkeley positively denies the existence of bodies 'without the mind', but Malebranche had already argued that it was impossible to prove their existence conclusively, thus paving the way for their dismissal. Again, Malebranche had insisted that there are no corporeal *causes*, and that, strictly speaking, God is the only cause, and Berkeley certainly holds that only spirits can act. Moreover, Malebranche held, and Berkeley at least suggested, that in perception, God's ideas are revealed to us. It is significant, then, that in his own day, despite his protestations, Berkeley was often seen as essentially a follower of Malebranche. We might note, finally, that while Malebranche had concluded that neither sense nor reason could conclusively establish the existence of bodies, he also held that faith in the Scriptures did require this belief. When in the *Principles* Berkeley considers a number of possible objections to his positive rejection of 'matter', this argument from the Scriptures is the last that he chooses to tackle. As he says, 'I do not think, that either what philosophers call *matter*, or the existence of objects without the mind, is any where mentioned in Scripture' (*Principles* §82).

There is evidence that Bayle too was an early influence, and when, as in the preface to the *Principles*, Berkeley refers to 'those who are tainted with scepticism', arguments he found in Bayle's *Dictionnaire historique et critique* were probably towards the front of his mind. Bayle had offered arguments against regarding extension and motion as any more objective than colour or smell (which the Cartesians recognized as mere 'sensations'), and for the view that the notion of real extension (for Cartesians the essence of matter) involved contradictions. Strict reasoning, Bayle argued, would thus lead us to deny the existence of bodies, in the face of our (fortunately) ineradicable beliefs. Berkeley could welcome and adapt these arguments to the extent that he was concerned to reject bodies 'without the mind', and while, unlike Bayle, Berkeley firmly denied that they lead to scepticism or to any conflict with common sense, it is hardly surprising if many of his contemporaries took a different view. As Andrew Baxter saw it, Berkeley was committed to the conclusion that 'he has neither *country* nor *parents*, nor any *material body* (but that all these things are mere *illusions*, and have no existence but in the fancy' (Baxter [1733] 1737, vol. 2: 260).

3 Berkeley's metaphysics

Berkeley is understandably best known for his (at first sight outrageous) claim that mind or spirit is the only substance, and that it is God who produces 'sensations' or 'ideas' in our minds. From the beginning, many regarded this view as sceptical at best or insane at worst, and Berkeley recognized that this might be the initial reaction. It is, then, an important feature of his position that, if rightly understood, his standpoint will be seen as common sense, and in accord with the views of the unsophisticated 'vulgar'. The purpose of the present section is to sketch in very general terms how Berkeley could see things in this way.

To begin with, we can hardly make sense of Berkeley's position unless we see him as starting from an assumption that he took both to be obviously true and to be shared by other philosophers, which was that each of us is aware only of the 'ideas', 'sensations' or 'perceptions' that are somehow or other produced in our minds. On the most common view - that taken by Descartes and Locke for example - these are produced in us by external objects, which objects we do not perceive 'immediately' because, as Locke put it (whatever precisely he meant by it), 'the Mind… perceives nothing but its own *Ideas*' (Locke, *Essay* IV 4: §3). Berkeley's first insight, and it is one that his reading of Malebranche and Bayle must have encouraged, was that if we set things up in this way - distinguishing

between the ‘ideas’ we perceive and the ‘real’ objects which lie hidden beyond them - scepticism becomes inevitable. At best we can hypothesize the existence of ‘real’ objects as the *most likely* causes of our ideas, but then we are vulnerable to the suggestion that there could be other causes, including, most plausibly, God. There are other difficulties too. Berkeley found it widely admitted that it is quite unclear how inert ‘matter’ could act on minds so as to produce ideas or perceptions in them (and Malebranche and other ‘occasionalists’ had denied that it in fact does) (see Occasionalism); moreover, Berkeley found only obscurities and incoherencies in the prevalent conceptions of ‘material substance’. Yet the most fundamental insight was to follow.

This insight was that when we - ordinary men and women - talk of houses, mountains, rivers and so on, we are talking about what we experience or are aware of, not of occult objects that we are not directly aware of at all. It follows, or at least it seemed to Berkeley to follow, that if when we refer to houses, mountains and rivers we are referring to things we are aware of, and if (as other philosophers agreed) we are aware only of ideas, houses, mountains and rivers must *be* ‘ideas’ or appearances or, better, ‘collections’ of such ideas. Certainly - and this was one thing that his readers found most difficult to handle, but which Berkeley himself was most insistent on - there is no need to deny that houses, mountains and rivers exist, but only to stress (common-sensibly) that they are the very things we perceive, which is to say that they are mind-dependent ideas. Their *esse* (being) is *percipi* (to be perceived); they exist only in the mind.

Berkeley’s major philosophical works, and in particular the *Principles* and *Dialogues*, are, in the main, a sustained defence of these insights and doctrines, together with a working out of their implications. For Berkeley, the implications, including those for religion and the sciences, are as important as the basic metaphysics. Yet the fundamental case for that metaphysics is supposed to be very simple indeed. Even by the end of section six of the *Principles* (under three pages in most editions) that case has supposedly been established.

4 The *New Theory of Vision*

Although Berkeley’s *An Essay towards a New Theory of Vision* (1709) was published just one year before the *Principles*, and Berkeley was already convinced that there was no such thing as ‘matter’, or bodies ‘without the mind’, this, his first major work, stopped short of making that claim. As he said in the *Principles*, although the earlier book had shown that ‘the proper objects *of sight* neither exist without the mind, nor are the images of external things (*Principles* §44; emphasis added), it had done nothing to disabuse readers of the view that tangible objects are external. At one level, then, the work can be seen as a sort of halfway house on the route to presenting his full case for immaterialism, but it is undoubtedly also true that he was fascinated by problems concerning vision in their own right. He was clearly very well read in optical theory, he had his own highly distinctive contribution to make, and for many years that contribution was esteemed by many who had little interest in, or were possibly quite blind to, any wider implications it may have had.

Ostensibly, then, the *New Theory of Vision* is merely an attempt to ‘shew the manner wherein we perceive by sight the distance, magnitude, and situation of objects’, though, still in the opening section, Berkeley also announces that he will be considering ‘the difference there is betwixt the ideas of sight and touch, and whether there be any idea common to both senses’ (*New Theory of Vision* §1). Broadly, the issue concerning ‘situation’, which others had recognized, is that of how we see things the ‘right’ way up (so to speak) when their images are inverted on the retina; that concerning ‘magnitude’ is how we judge objects at a distance to be small or large (one particular problem was why the moon on the horizon looks larger than the moon in the zenith, although they are virtually the same distance from us); and that concerning ‘outness’ or distance is that of how we come to see things as being at various distances, given that, as Berkeley observes, it was accepted that ‘distance being a line directed end-wise to the eye, it projects only one point in the fund of the eye, which point remains invariably the same, whether the distance be longer or shorter’ (*New Theory of Vision* §2). Berkeley’s solution is similar in each case. In the case of distance, for example, even when an object is relatively close, we do not, as others had supposed, make our judgments on the basis of what Descartes had described as a sort of ‘natural geometry’, and on facts such as that lines drawn from the two eyes to the object form a greater angle the closer the object is: the supposed lines and angles are only theoretical entities, and are not at any rate perceived. Rather, we *learn* to make these judgments solely on the strength of certain sensory cues including, for example, the sensations accompanying the turn of the eyes, and the increasingly confused appearance of an object as it comes closer to us. An explanation in terms of geometry is thus replaced by a psychology of vision in which, crucially, the connection between the cues

and the distance discoverable by touch turns out to be purely contingent. '[I]f it had been the ordinary course of Nature that the farther off an object were placed, the more confused it should appear, it is certain the very same perception that now makes us think an object approaches would then have made us to imagine it went farther off' (*New Theory of Vision* §26).

Though often regarded as controversial, Berkeley's work on the psychology of vision was also highly influential even though, and indeed partly because, Berkeley's ultimate metaphysical commitments are not apparent, and certainly not necessarily required for an acceptance, for example, that 'a man born blind, being made to see, would at first have no idea of distance by sight'. Admittedly Berkeley's account of our judgments is in terms of 'sensations', 'appearances' and 'ideas', as all we have to go on, and we are told, for example, not only that the man just cured of blindness would take the 'objects intromitted by sight' to be 'no other than a new set of thoughts or sensations, each whereof is as near to him as the perceptions of pain or pleasure, or the most inward passions of his soul', but that he would be right to do so (*New Theory of Vision* §41). Yet nothing is said to disabuse the reader of the thought that there is, for example, a distant moon, which is not at all dependent on the mind. There is a sense, therefore, in which the *New Theory of Vision* offers us some of the fruits of idealism without explicitly announcing the immaterialism, and one of those fruits is an indication of the existence of God (see Idealism). By the end of the work, Berkeley has concluded that there are no ideas common to sight and touch: the extension perceived by touch, for example, is quite distinct from, and has no likeness to, any visual idea. Here he considers a problem first raised by William Molyneux and discussed by Locke, agreeing with them that a man just cured of blindness who saw a cube and a globe for the first time would not know just by looking which was which, but seeing this answer as confirming his own view that visual ideas are merely 'signs'. These we learn to correlate with tangible ideas in much the same way as we learn a language. Berkeley takes this analogy very seriously. His conclusion in the first edition is thus that 'the proper objects of vision constitute the universal language of nature, whereby we are instructed how to regulate our actions', but by the third edition 'nature' has become 'the Author of nature', or God (*New Theory of Vision* §147).

5 The Introduction to the *Principles*

Berkeley prefaces *A Treatise concerning the Principles of Human Knowledge* (1710) with an important introduction which is for the most part devoted to an attack on abstract ideas, and in particular abstract general ideas. In it he quotes freely from Locke. Yet, as already stated, his target was wider, including philosophers generally and, ultimately, a variety of philosophical confusions. One needs to look outside the introduction to discover what these alleged confusions are. Sometimes this is fairly straightforward. Even in the *New Theory of Vision* the notion that there is an idea of extension common to both sight and touch is ascribed to the supposition that we can abstract it from all other visible and tangible qualities; while, in the *Principles*, the notion that the supposed 'primary' qualities exist in the outward object, although colours and the like are 'in the mind alone', is undermined by the observation that 'extension, figure, and motion, abstracted from all other qualities, are inconceivable'. Similarly, the idea of 'pure' or 'absolute' space is ruled out, it being 'a most abstract idea'. In one important case the connection is perhaps less obvious: Berkeley claims that holding that sensible objects can exist unperceived depends on illegitimate abstraction, but commentators have often found it difficult to see precisely how this is supposed to work. In yet other cases, the supposed connections have been less frequently explored in the literature, as for example when Berkeley has it that the Schoolmen were 'masters of abstraction' and, in the *Dialogues*, that Malebranche 'builds on the most abstract general ideas'. These matters can probably be sorted out. Malebranche had attacked the 'disordered abstractions' of the Schoolmen, who posited occult qualities and powers, and who supposed that matter is something distinct from its known attributes, and in particular from extension, and Berkeley had probably learned from that. Yet Malebranche himself fell foul of Berkeley's anti-abstractionism by talking of 'absolute' and 'intelligible' extension, by supposing that extension was the essence of matter, and by assuming an idea of 'being in general'. The connection between abstraction and the denial of the '*esse* is *percipi*' principle is trickier.

Berkeley's introduction attacks the view that, although the qualities of objects are always 'blended together' in them, we can frame a separate idea of each quality; that we can form, for example, an abstract idea of colour or extension in general; and that we can frame an idea corresponding to the word 'man' or 'triangle', as distinct from the ideas of particular men or particular triangles, as Locke had suggested. This in turn requires from Berkeley an alternative account of language to Locke's, which will not require that each general term stands for an idea. This

alternative account is not worked out very fully, but Berkeley does insist that 'a word becomes general by being made the sign, not of an abstract general idea but, of several particular ideas, any one of which it indifferently suggests to the mind' (*Principles*, Intro. §11). Moreover, suggestions towards the end of the introduction that words have other uses than to mark out ideas, including the production of appropriate emotions - 'May we not, for example, be affected with the promise of a *good thing*, though we have not an idea of what it is?' (*Principles*, Intro. §20) - have rightly been seen as significant, and further developments along these lines, in particular in the seventh dialogue of *Alciphron*, have even been seen as making him a precursor of Wittgenstein in this area.

6 The *Principles*

Berkeley's basic metaphysical position is usually known as 'idealism' or, because of what it denies, as 'immaterialism', and the classic defence of this position is offered in *A Treatise Concerning the Principles of Human Knowledge*. Like all Berkeley's works, this is well structured, with just 156 short sections: sections 1-33 argue the case for his idealism, sections 34-84 anticipate and answer possible objections, and the remaining sections take 'a view of our tenets in their consequences'.

As already indicated, Berkeley takes even his opponents to accept that, whatever else there may turn out to be in the world, we perceive only ideas. This assumption emerges in the opening section of the *Principles* (which is clearly modelled on the opening sections of the first chapter of Book II of Locke's *Essay*). Here Berkeley writes, or at least suggests, that 'the objects of human knowledge' are all 'ideas', adding that when certain ideas, for example a certain colour, smell and so on, are found going together they are 'reputed as one thing'. On the face of it, this blurs Locke's distinction between 'qualities' and 'ideas', and ignores Locke's supposition of a 'substratum' for the qualities. Yet Berkeley knows what he is doing, and clearly found encouragement in Locke's own preparedness not only to use 'idea' where he means 'quality', but also to assert that we have no other ideas of particular sorts of substances 'than that which is framed by a collection of those simple *ideas* which are to be found in them'. Certainly, we are supposed to start with 'ideas', although - as Berkeley points out in the second section -there are also the minds or spirits that perceive them. However, he soon insists that there can be no substance apart from mind. Given that sensible objects are ideas, and that ideas exist only when perceived, it becomes simply absurd to suppose that these objects could have any existence apart from perception; a fact that is confirmed, in Berkeley's view, simply by attending to 'what is meant by the term *exist* when applied to sensible things'. When I say that a table 'exists', I am referring to something that I perceive, or at least that I might perceive, and certainly not applying 'exists' to some object which, because it is not an idea, is not perceived at all.

This argument, like most of Berkeley's arguments, is tricky and needs careful handling. Ostensibly, it seems to have very little to do with the word 'exists' because, as Andrew Baxter observed, neither philosophers nor ordinary people seem to mean 'is perceived' by 'exists' in sentences such as 'the table exists'. That point is a fair one, and Berkeley's actual argument does seem to depend heavily on the underlying assumption that the only perceivable objects are mind-dependent items, which must consequently be actually perceived. The stress put on the word 'exists' remains puzzling, however, and one relevant fact seems to be that Locke had held that 'existence' was a simple idea 'suggested to the Understanding, by every Object without, and every *Idea* within' (Locke, *Essay*, II 7: §7). Berkeley had convinced himself both that the idea thus described was abstract (and hence impossible), and that this idea is involved when people suppose things to exist quite independently of perception. To perceive a table as existing and to simply perceive it are one and the same experience, and the existence cannot be separated from the perception so that we can attribute an 'absolute existence' to the thing.

That is at any rate what Berkeley concludes on the basis of the first few sections. But of course he expected resistance. His tactic now becomes, therefore, to seize on supposedly unsatisfactory features of his opponents' position and, by exposing them, to further his own case. If it is suggested, for example, that our ideas are merely the *likenesses* of external qualities, the counter is that an idea (or perceived thing) can be *like* nothing but an idea (or another perceivable thing). To those who argue that the supposed 'primary' qualities exist in outward objects but that colours and the like do not, his response is twofold: first, we cannot even conceive of an object having merely extension, figure and motion, but lacking any of the qualities these other philosophers recognize as mind-dependent; second, the basic argument deployed to prove that secondary qualities are mind-dependent (that is, that the appearance varies in varying circumstances) would prove the same of any quality whatsoever.

Furthermore, those who posit a material substratum as the *support* of qualities find that they can attach no clear meaning in this context even to the term ‘support’. There are other arguments, including a particularly tricky and much discussed one in which he proudly claims that it is impossible to conceive that there even *might* be a mind-independent object, for to conceive it would be to frame the idea of it, which would mean that it was an object of thought or perception after all. However, Berkeley is at his rumbustious best in sections 18-20, arguing that neither sense nor reason can establish that there are external bodies, and that they cannot even be posited as an hypothesis to account for our receiving the ideas we do. Even if we suppose, arbitrarily, that there are external bodies, the materialists ‘by their own confession are never the nearer knowing how our ideas are produced: since they own themselves unable to comprehend in what manner body can act upon spirit, or how it is possible it should imprint any idea in the mind’ (*Principles* §19). What emerges, predictably, is that the only possible cause of our ideas is another, superior spirit, who presents our ideas to us in orderly ways which in fact *constitute* the Laws of Nature, and which Berkeley also sees as constituting the *language* of God himself.

7 The *Principles* (cont.)

While the first thirty-three sections of the *Principles* are in an obvious sense basic, the sections in which Berkeley deals with possible objections to his thesis are important too. Here most readers new to Berkeley are likely to find that the first objections that spring to their minds have been anticipated, while the answers Berkeley gives help to clarify his basic thesis. The objections he envisages include, for example, that, given his idealism, everything becomes illusory or unreal; that we see things at a distance from us, so they are not ‘in the mind’; that, if the *esse* of sensible things is *percipi*, they will disappear when we stop perceiving them, which is absurd; and that, if objects are only ideas, or collections of ideas, there can be no causal interaction between them, so we will have to deny that fire heats and that water cools. Whether Berkeley’s answers to such objections satisfy us is another matter, but the objections are at least confronted, and the answers are always interesting. On the third objection mentioned above, for example, it is eventually suggested that for an object to exist it is necessary only for some mind to perceive it, with the implication that God’s perception may guarantee the continued existence of objects. The answer to the fourth objection above is that, just as we continue to say that the sun ‘rises’ despite scientific knowledge that it is the earth that moves, so this is another area where ‘we ought to *think with the learned, and speak with the vulgar*’ (*Principles* §51), recognizing that, strictly, the regularities in nature we describe as causal are ultimately down to God. In answering both these objections, Berkeley is typically quick to point out that his philosophical opponents are insecurely placed to make them. Even those who hold that there are external and material bodies are committed to the view that light and colours, or visible objects, are ‘mere sensations’, and thus to holding that these disappear when I shut my eyes; while, when it comes to causal relationships between objects, many other philosophers, both among the Schoolmen and modern philosophers, have held that God is the ‘immediate efficient cause of all things’.

In answering the second of the above objections, Berkeley predictably refers the reader back to the *New Theory of Vision*; but his answer to the first objection is more complex. There are, he stresses, decisive differences between the ‘faint, weak, and unsteady’ ideas of the imagination and those imprinted on the senses by God, and though he calls both ‘ideas’ to emphasize that they are equally in the mind, he would not object to simply calling the latter ‘things’. Nor does he deny even that there are corporeal substances, if ‘substance’ is taken ‘in the vulgar sense, for a combination of sensible qualities’. It is, he suggests, only other *philosophers* he opposes, for they take corporeal substance to be ‘the support of accidents or qualities without the mind’. We may well feel that this point glosses over the one big difference between Berkeley and the vulgar, which is that the vulgar do not recognize sensible qualities to be mind-dependent ideas, but it is one that Berkeley insists on. ‘The only thing whose existence we deny, is that which philosophers call matter or corporeal substance. And in doing of this, there is no damage done to the rest of mankind, who, I dare say, will never miss it’ (*Principles* §35).

8 The *Principles* (cont.)

The full title of the *Principles* describes it as a work ‘Wherein the chief causes of error and difficulty in the Sciences, with the grounds of Scepticism, Atheism, and Irreligion, are inquired into’. While Berkeley believes idealism to be true, he is as interested in the benefits that flow from accepting it. These include establishing the existence of God and attaining a proper understanding of God’s role in the world; the banishment of scepticism concerning the nature and the very existence of ‘real’ things, both of which result from distinguishing the ‘real’

from what we perceive; and the resolution of certain philosophical, scientific and mathematical perplexities. From section 85 onwards, therefore, Berkeley takes ‘a view of our tenets in their consequences’.

Some of the supposed advantages are obvious once stated, and they include the resolution of three issues Berkeley mentions at the outset: ‘Whether corporeal substance can think?’ (a possibility mooted by Locke, which threatened belief in the natural immortality of the soul); ‘Whether matter be infinitely divisible?’ (a long-standing issue, with Bayle in particular having exposed the paradoxes that arise whether we suppose that it is or it is not); and ‘how [matter] operates on spirit?’ (a problem that had exercised the Cartesians). None of these questions arises once it has been proved that there is no ‘matter’; that the soul is immaterial, or ‘one simple, undivided, active being’ which is therefore ‘indissoluble by the force of Nature’; and that, just as we can produce ideas in our own minds when exercising our fancies, so God (the superior spirit) can produce in our minds those ideas which constitute sensible things. In addition, however, Berkeley explores at some length the implications for natural philosophy and mathematics.

These, it must be stressed, were not simply casual interests for Berkeley. His very first publication - a compilation of two titles, *Arithmetica* and *Miscellanea Mathematica*, (1707) - evidences his early proficiency in mathematics, and the philosophically more significant manuscript *Of Infinites* was written at about the same time. The latter concentrates on the ‘disputes and scruples’ which infect modern analytical geometry, all arising from ‘the use that is made of quantitys infinitely small’. Moreover *De Motu* (1721) includes an examination of the role that such concepts as force, gravitation and attraction play in Newtonian mechanics. There would have been more on these topics in the additional parts of the *Principles* which Berkeley intended to write, as indeed there would have been on persons, perceivers or spirits. What he does say on the latter subject in the*Principles* as we have it is thin, and it is perhaps necessary only to note that Berkeley’s view is indeed broadly Cartesian, though the Berkeleian dualism is between ‘indivisible, incorporeal, unextended’ minds and ideas, not minds and ‘matter’; that he even convinces himself that the soul always thinks; and that the stress is on Berkeley’s claim that we do not know ourselves, or other spirits, by way of *idea*. This insistence underlies our earlier observation that in the opening section of the *Principles* Berkeley writes, or at least *suggests*, that all the objects of knowledge are ideas; for the truth is that, though Berkeley was prepared to give this impression at the outset (presumably so as not to raise an unnecessary complication early on), his own use of ‘idea’ for ‘any sensible or imaginable thing’, as he put it in the *Philosophical Commentaries*, rules out any ‘idea’ of spirit, or of the operations of the mind. Certainly, though, this is not supposed to be worrying, and Berkeley is not suggesting that the word ‘mind’ is insignificant. When he started penning the entries in the *Commentaries* he had indeed accepted the Lockian view that all significant words stand for ideas, but he had soon rejected that principle, partly as a result of deciding that the essentially active mind must be carefully distinguished from its passive objects or ‘ideas’.

9 *Three Dialogues between Hylas and Philonous*

The *Principles of Human Knowledge* is the most important book in the Berkeleian corpus and, had its reception not been so disappointing to Berkeley, the *Three Dialogues between Hylas and Philonous* (1713) would probably not have been written. People were readier to ridicule than to read a treatise that denied the existence of ‘matter’, while those who did read it usually misunderstood it. The *Dialogues*, therefore, were written, as Berkeley says in the preface,‘to treat more clearly and fully of certain principles laid down in the First [Part of the *Principles*], and to place them in a new light’, and the dialogue form proved an admirable way of allowing likely objections to be dealt with at each stage (as well as making the book still perhaps the most attractive introduction to Berkeley). The protagonists are Hylas (the name derives from the Greek word for ‘matter’) and Philonous (the ‘lover of mind’, representing Berkeley himself). At the outset Hylas assumes that the Berkeleian is the proponent of ‘the most extravagant opinion that ever entered into the mind of man’ (*Works*, vol. 2: 172), but, as the discussion progresses, Philonous is able to demonstrate that, although he accepts with other philosophers that ‘the things immediately perceived, are ideas which exist only in the mind’, his additional acceptance of the view of ordinary men and women that ‘those things they immediately perceive are the real things’ allies him with common sense (*Works*, vol. 2: 262).

Doctrinally there are no substantial innovations here, although Berkeley has Philonous take pains early on to convince Hylas that ‘sensible qualities’, or the things *immediately* perceived, are mind-dependent, making great play of how appearances vary for different perceivers, and for the same perceiver in different circumstances. Other

features include a striking passage, expanded in the third edition, which contains an anticipation of, and an attempt to answer, what is normally taken to be the Humean point that material and spiritual substance are on a par, so that if one is rejected, so too should the other. It is indeed a particularly attractive feature of the work that Hylas is allowed to be a quite pugnacious opponent who really does test the idealist's position. To give just one other instance, it is likely to occur to us that, if the things we perceive are identified with 'ideas' or 'sensations', surely each idea will be dependent on the particular mind that has or perceives it, with the apparently far from common-sense consequence that 'no two can see the same thing'. Berkeley's answer may or (more likely) may not satisfy us, but there is a deeper issue underlying Hylas' challenge which Berkeley himself may not have adequately explored. This concerns the relationship between particular ideas - whether described as 'sensations' or 'appearances' - and the 'collections' of ideas which, for Berkeley, constitute publicly observable objects. There are no more than hints that Berkeley may be prepared to countenance the notion that the permanently existent table is an archetypal idea in God's mind, and that we can be said to perceive it when we perceive any of the 'fleeting… and changeable ideas' which, to some degree, correspond to it.

10 *De Motu*

Berkeley intended to publish additional parts of the *Principles* and apparently made some progress on the second part, telling Samuel Johnson in 1729 that 'the manuscript was lost about fourteen years ago, during my travels in Italy, and I never had leisure since to do so disagreeable a thing as writing twice on the same subject', but that was as far as he got. Remarks in the *Philosophical Commentaries* suggest that one part would have been 'our Principles of Natural Philosophy', and we can assume that it would have included the sort of material covered in a work he did publish, *De Motu* (1721). This work reiterates and develops certain points already made in the *Principles* when Berkeley was taking 'a view of our tenets in their consequences', but although it is indeed assumed that minds are not corporeal, it would not have been apparent to the reader that Berkeley holds that the *esse* of sensible things is *percipi*. Rather, what is insisted on is that 'it is idle to adduce things which are neither evident to the senses, nor intelligible to reason' (*De Motu* §21), and that when we attribute gravity and force to bodies we are improperly positing occult qualities which take us beyond anything we can experience or conceive. 'Abstract terms (however useful they may be in argument) should be discarded in meditation, and the mind should be fixed on the particular and the concrete, that is, on the things themselves' (*De Motu* §4).

It is, therefore, idle to look to the qualities of bodies themselves in order to discover a cause of motion, for 'what we know in body is agreed not to be the principle of motion' (*De Motu* §24). Relying as we should on what we can conceive, we must look to mind for that principle, for we know from our ability to move our limbs that minds can act. On this basis we should conclude that 'all the bodies of this mundane system are moved by Almighty Mind according to certain and constant reason' (*De Motu* §32).

It is clear, then, that *De Motu* fits in with Berkeley's ultimate aim in all his philosophical writings, which is to bring out the dependence of the world upon God. Yet here, as in the case of everything he was to publish later, the elements of his metaphysics that had most perplexed the readers of the *Principles* and the *Dialogues* are either absent or in the background. Indeed, it is a feature of *De Motu* that Berkeley is anxious to present himself as representing a tradition going back to the ancient Greeks, but including the Schoolmen and the Cartesians, which recognizes the ultimate dependence of motion on God. Indeed, 'Newton everywhere frankly intimates that not only did motion originate from God, but that still the mundane system is moved by the same actus' (*De Motu* §32). It must be stressed, however, that it is not this supposed consensus that makes Berkeley's philosophy of science interesting, but his understanding of the proper role of the natural scientist as contrasted with that of the metaphysician. Terms such as 'gravity' and 'force', for example, have a legitimate use, in facilitating calculations on the basis of certain observable regularities in the behaviour of objects. We go wrong only if we confuse the discovery of regularities with genuine explanations of them. By contrast, absolute space and absolute motion, which were posited in Newtonian mechanics, are rejected outright, as indeed they were in the *Principles*. We should 'consider motion as something sensible, or at least imaginable,' and 'be content with relative measures' (*De Motu* §66). If there were but one body in the universe, it would make no sense to suppose that it moved (see Newton, I.).

11 *Alciphron* and *The Analyst*

Berkeley published *De Motu* in 1721 and nothing of any philosophical significance for over ten years thereafter.

Indeed none of his later writings matched in importance what had already appeared. Yet all were controversial, and some were taken very seriously at the time. These included *Alciphron* (1732) and *The Analyst* (1734) which represent, if in very different ways, Berkeley's commitment to defending religion against those seeking to undermine it.

Alciphron is composed of seven lively dialogues in which two Christian gentlemen, Euphranor and Crito, defend the religious and Christian standpoint against two 'free-thinkers', Alciphron and Lysicles. These are, of course, fictitious characters, but are allowed on occasion to present (or misrepresent, as many have claimed) the views of such actual, though unnamed, figures as the third Earl of Shaftesbury and Bernard Mandeville. Mandeville complained bitterly that his thesis that private vices are public benefits had been totally distorted in *Alciphron*; others have said the same of Berkeley's treatment of Shaftesbury's ethical theory. For all that, the book remains very readable. It contains, moreover, the only account of free-will published by Berkeley, and also the first explicit linking of the doctrine concerning the heterogeneity of the objects of sight and touch to a proof of the existence of God. Additionally there is a discussion in the Seventh Dialogue of particular interest in that it returns us to the topic of language.

The context is still the acceptability of religion, but at this point the objection from the free-thinker Alciphron is that the Christian religion is ultimately unacceptable, not because it can be shown to be false, but because it is straightforwardly unintelligible, involving, as it does, such meaningless notions as that of 'grace'. Here Alciphron appeals to the principle that 'words that suggest no ideas are insignificant'. Consequently this principle, which Berkeley had himself assumed in a demonstration of immaterialism nearly half way through the *Commentaries*, now becomes his explicit target. He reiterates his objection to abstract ideas, but also stresses the role of words in directing our practices, whether in mathematics and natural science, or in the religious sphere. It has been debated whether or not what we find here marks any decided shift from the line he had taken in the introduction to the *Principles*, and it is certainly true that Berkeley had long since moved towards the position he adopts here, but the discussion in *Alciphron* does reflect his mature consideration of the topic. It stresses the use of words as signs which, as he had put it to Samuel Johnson, 'as often terminate in the will as in the understanding, being employed rather to excite, influence, and direct action, than to produce clear and distinct ideas' (*Works*, vol. 2: 293).

By contrast with *Alciphron*, the *Analyst* is a technical work in the philosophy of mathematics, containing criticisms of Newton's calculus. The adequacy of these criticisms is still debated, but they were sufficiently acute to generate considerable controversy among the mathematicians. To this controversy Berkeley contributed two further works in 1735, *A Defence of Free-thinking in Mathematics*, and *Reasons for not replying to Mr. Walton's Full Answer*. Berkeley's theological preoccupations are again relevant in this area, for *The Analyst* was addressed to an unnamed 'infidel mathematician', who has generally been identified with Edmund Halley (of Halley's Comet fame). Halley had been reported as claiming that Christian doctrines were 'incomprehensible', and the religion an 'imposture'. Berkeley is able to take delight in answering that the objection comes ill from a mathematician. He targets what he saw as obscurities and contradictions in the calculus. Some of these result from assuming an increment of infinitesimal value which, without reaching zero, proceeds towards a limit of zero, allowing the analyst to predict the system's value at a conceptual point at which the increment becomes nothing. A consequence is that these 'ghosts of departed qualities' are both used and disregarded in one and the same proof. As already mentioned, Berkeley's interest in mathematics was of long standing, as was his opposition to infinitesimal quantities. He was able to show how these lead to absurdities in the calculus, and to argue against those who 'though they shrink at all other mysteries, make no difficulty of their own'. Moreover, he was able to do this without mentioning his own idealist view that, because *esse* is *percipi*, the smallest quantity must be what he had earlier called the *minimum sensibile*, which cannot be divided into parts.

12 *Siris*

Siris (1744), the last of Berkeley's writings of any substance, is also in many ways the strangest. His championship of tar-water as a useful remedy against many diseases (and as a possible panacea) is likely to strike us as foolish, though it was to some extent understandable given his apparently successful use of it in his diocese. Moreover, although it was practical experience that had led him to his belief in the virtues of tar-water, Berkeley does go deeply into the explanation of its effectiveness, relying on theories which gave prominence to the role of 'aether', or 'pure invisible fire', as the vital principle of the corporeal world. Here again we can now see that Berkeley was

wrong, although he was able to appeal to authorities, both ancient and modern. Indeed, this readiness to appeal to authorities, or to seek for maximum consensus, extends to the final sections in which his chain of philosophical reflections leads him to focus on God as 'the First Mover, invisible, incorporeal, unextended, intellectual source of life and being' (*Siris* §296). Here themes familiar from the early works re-emerge - including the view that 'all phenomena are, to speak truly, appearances in the soul or mind' (*Siris* §251) and that there are, strictly, no corporeal causes. Yet these are now tied in with what appear to be alien elements. There is a tendency to disparage the senses, and Berkeley's fascination with the philosophies of the ancients extends to a degree of sympathy for the Platonic Theory of Forms. That said, Berkeley's eclectic and somewhat hesitant approach in *Siris* is such that it would be wrong to look to it for evidence of a substantially new philosophical position. Though fascinating in its way, *Siris* now seems very dated indeed.

13 Concluding Remarks

Inevitably, Berkeley is famed for the metaphysics of the *Principles*, and *Dialogues*. It would be easy to multiply quotations from people who treated that metaphysics as absurd, but very wrong to suggest that all the reactions have been hostile, or that the more hostile responses have not frequently been based on misunderstandings. At the other extreme, John Stuart Mill was to refer to Plato, Locke and Kant among others when describing Berkeley as 'the one of greatest philosophic genius' (Mill [1871] 1978: 451), while A.A. Luce, the most prominent Berkeley scholar of the twentieth century, held Berkeley's views to be fundamentally correct, and to coincide with the common-sense view of the world. Even many who would be less effusive have at least seen Berkeley as playing an important role in the history of philosophy, if only as marking one important stage on the route from Locke to Hume, and then to Kant and modern idealism. Certainly, no serious commentators would judge that his views can be easily or simply dismissed, though they would often give very different accounts of what makes him important and interesting. Luce, for example, found the role God has to play in Berkeley's system attractive; Mill thought it an embarrassment. Phenomenalism, the theory of perception which Mill himself espoused, could indeed be described as 'Berkeley without God' (see Mill, J.S. §6; Phenomenalism).

The fact is that Berkeley was grappling with problems that are perennial in philosophy, including that of the relationship between appearance and reality, or between our experiences and what we take them to be experiences of. Their treatments of these issues have very often led philosophers to say things that would strike the 'vulgar' as strange, and if Locke's position, for example, seems initially more congenial (in that Locke never doubts the existence of a world corresponding to, but distinct from, our 'ideas', and treats scepticism in that area as absurd), Berkeley was neither the first nor the last to see him as, in effect, making knowledge of that world impossible. Berkeley did not invent the sceptical challenge that arises from insisting on a distinction between what we 'immediately' perceive and an external 'material' world; if his way of dealing with it is radical, one must recognize that 'idealism' in one form or another was to have quite a history - even now there are philosophers who are happy to use the label to describe their own philosophical positions.

Certainly Berkeley does sometimes exaggerate the extent to which he is at one with the 'vulgar', or with our ordinary views about the world. He may be quite right that he is at one with those who believe that '*those things they immediately perceive are the real things*'. Yet, as we saw in §9 above, it is only by combining this with the claim that '*the things immediately perceived, are ideas which exist only in the mind*', which he attributes to 'the philosophers', that he arrives at a theory concerning the nature of reality that is very much his own. Consequently, although he can chide his opponents for their commitment to such views as that 'the Wall is not white, the fire is not hot', remarking in the *Commentaries* (entry 392) that 'We Irish men cannot attain to these truths', many of his own claims, such as that 'Strictly speaking… we do not see the same object that we feel; neither is the same object perceived by the microscope, which was by the naked eye' (*Works*, vol. 2: 245), would strike the vulgar as equally odd. Berkeley's beliefs about what it is that we 'immediately' perceive may or may not be true, but clearly they are not vulgar views.

To be fair, Berkeley was not unaware that this was the position. For example, his comment that on the issue of causal relationships between objects we should '*think with the learned, and speak with the vulgar*' (*Principles* §51) suggests that the vulgar have not appreciated the truth of the matter; while claims that he opposes only other philosophers contrast with passages such as that in the *Principles* in which he actually refers to the 'mistake' of the vulgar who believe that the 'objects of perception [have] an existence independent of, and without the mind'

(*Principles* §56). To be sure, in the same discussion he suggests that they cannot *really* believe this, because the supposed belief involves a contradiction, and 'Strictly speaking, to believe that which involves a contradiction, or has no meaning in it, is impossible' (*Principles* §54), but the whole passage rests on the equation of the objects of perception with 'ideas', which is what *makes* the supposed belief contradictory.

The truth is, therefore, that for all his resolve in the *Commentaries* (entry 751) 'To be eternally banishing Metaphisics &c & recalling Men to Common Sense' (and what he seems to have in mind there is the arid metaphysics of the Schools), Berkeley does offer us what we would naturally describe as a metaphysics, and one that cannot be refuted simply on the ground that it might strike the average person as outrageous. His arguments must be examined on their merits, together with any underlying assumptions; attention has to be paid to the notion of 'immediate' perception which he works with; and account must be taken of possible problems generated by his metaphysical conclusions. These may include, as has often been claimed, an unrecognized tendency towards solipsism. Not that it is necessary to reject or accept his philosophy in total, for there may be insights alongside what we believe are mistakes. As with any philosopher of Berkeley's stature, doing justice to Berkeley's philosophy turns out to be a very complex, but also a rewarding exercise, which is why his philosophy still exercises the commentators today.

IAN TIPTON

List of works

Berkeley, G. (1948-57) *The Works of George Berkeley, Bishop of Cloyne*, ed. A.A. Luce and T.E. Jessop, Edinburgh: Thomas Nelson, 9 vols.(The standard edition, containing Berkeley's published and unpublished writings, both philosophical and non-philosophical. The philosophical correspondence between Berkeley and Samuel Johnson is in vol. 2.)

Berkeley, G. (1707) *Arithmetica* and *Miscellanea Mathematica*, in *Works*, vol. 4, Edinburgh: Thomas Nelson. (Published anonymously in one volume, these slight pieces are of relatively little interest today, even to mathematicians.)

Berkeley, G. (1707) *Of Infinites*, in *Works*, vol. 4, Edinburgh: Thomas Nelson.(Although Berkeley never published it, this essay is of some interest, both because of its anticipation of attacks on assumptions underlying the infinitesimal calculus that Berkeley developed in later works and for the use he makes of the Lockian principle - which he was to soon reject - that all words stand for ideas.)

Berkeley, G. (1707-8) *Philosophical Commentaries*, in *Works*, vol. 1, Edinburgh: Thomas Nelson.(Berkeley's notebooks, filled as he prepared to publish the *New Theory of Vision* and the *Principles*. They are of inestimable value to scholars. The dates given represent Luce's reasoned speculation; the title is that given to them by Luce.)

Berkeley, G. (1709) *An Essay towards a New Theory of Vision*, in *Works*, vol. 1, Edinburgh: Thomas Nelson.(The first of Berkeley's major works, and for long influential as a work on the psychology underlying our visual perception of the distance from us and the size and situation of objects. Although Berkeley's ultimate metaphysical commitments were not made manifest here, awaiting the publication of the *Principles* in the following year, this work prepared the ground for them.)

Berkeley, G. (1710) *A Treatise concerning the Principles of Human Knowledge*, in *Works*, vol. 2, Edinburgh: Thomas Nelson.(Undoubtedly Berkeley's most important work, in which he attacks 'material substance' and the notion that sensible objects exist 'without the mind'. Originally published as 'Part I', no further parts appeared.)

Berkeley, G. (1712) *Passive Obedience*, in *Works*, vol. 6, Edinburgh: Thomas Nelson.(An interesting little work in that it represents a rare excursion into political philosophy and ethics, and suggests a basically utilitarian position. Berkeley denies the legitimacy of resisting even a manifestly unjust ruler.)
